

## Chicago Climate Exchange Comments - ICF Review of API Compendium

1. It would be good to have some effort at a percentage breakdown of estimates of the relative shares of some of the smaller emission types/sources (e.g., various ventings etc.). I suspect some are reasonably considered de minimus, yet would take serious effort to quantify.
2. If there is a strong feeling that some of the GRI and EPA coefficients are strongly outdated/obsolete those entities should be informed of such.
3. The CAPP methods are brought up in the appendix but never in the body?
