Re: Western Refining Southwest, Inc. Crude Transloading facility permit application

Dear Permit Programs Manager,

After receiving the notice from Western Refinery via certified mail received June 19, 2015, we'd like our comments to be made part of the review process. The EPA states that there are two types of stationary sources that generate routine emissions of air toxics, "Major" and "Area". Western Refinery's total sum of all Hazardous Air Pollutants (HAPs) is 18.0 pph and 10.0 tpy. This puts them in the "Area" category which states the following:

- "Area" sources consist of smaller-size facilities that release lesser quantities of toxic pollutants into the air. Area sources are defined as sources that emit less than 10 tons per year of a single air toxic, or less than 25 tons per year of a combination of air toxics. Though emissions from individual area sources are often relatively small, collectively their emissions can be of concern - particularly where large numbers of sources are located in heavily populated areas. Source: [WWW.EPA.GOV/ttnatw01/pollsour.html](http://WWW.EPA.GOV/ttnatw01/pollsour.html)

**Comment:** Rehoboth Christian School is located SW of the transloading facility and within the immediate affected area. We are concerned about our students, 520 +/- enrolled for the upcoming 2015-2016 school year and beyond, and:

**Comment:** We want to make sure that the NM Environment Department Air Quality Bureau will protect the local environment (Rehoboth Christian School) from excessive pollution caused by industrial activities that take place within the property boundary of the stated terminal. We want to make sure that this includes air emission limitations, pollution control requirements, maintenance requirements and recordkeeping requirements.

Thank you for your time,

Respectfully,

James Wilson

Vigorously Academic, Beautifully Diverse, Thoroughly Christian
