Subject: Transmittal of Closure Certification Report for Technical Area 16-399 Open Burn Unit Los Alamos National Laboratory EPA ID #NM0890010515

Dear Mr. Nance:

The United States Department of Energy (DOE) National Nuclear Security Administration, Los Alamos Field Office and the Triad National Security, LLC (Triad) submit this report to the New Mexico Environment Department Hazardous Waste Bureau (NMED-HWB) in accordance with the *Amended Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray, Revision 2*, Los Alamos National Laboratory, EPA ID #NM0890010515 issued on February 15, 2024. DOE/Triad requested and received three extensions of time in March and September 2023 and February 2024 to complete closure of this unit.

The enclosed document provides certification of clean closure of the hazardous waste management unit at the TA-16-399 Burn Tray (Solid Waste Management Unit 16-010(d)). Included with the submittal is a compact disc with copies of this submittal, analytical data in an Excel format and the data packages as received by the off-site analytical laboratory to facilitate the review of the results by NMED-HWB.

If you have any questions or comments concerning this report, please contact Robert A. Gallegos (NA-LA) at (505) 901-3824 or by email at robert.gallegos@nnsa.doe.gov or Jason Hill (Triad) at (505) 551-2218 or by email at jshill@lanl.gov.

Sincerely,

1 Introduction

This closure certification report summarizes the activities performed to meet Resource Conservation and Recovery Act (RCRA) closure requirements for an interim status open burning treatment unit at Technical Area (TA) 16 at the Los Alamos National Laboratory (LANL or the Facility). The TA-16-399 Burn Tray (Solid Waste Management Unit 16-010(d)) is listed in the LANL Hazardous Waste Facility Permit, Attachment K, Table K-1, *SWMUs and AOCs Requiring Corrective Actions* as requiring corrective action. The TA-16-399 Burn Tray was used for treatment of high explosives waste generated by the high explosives production and testing facilities at LANL under the regulations at Title 40 of the Code of Federal Regulations (40 CFR), Part 265, Subpart P, *Thermal Treatment*.

The need for thermal treatment operations at the Laboratory has decreased through the careful consideration of waste generating operations. As a result, all necessary open burning treatments of waste explosives are managed at a single unit for the Facility. Additionally, the need for the type of waste treatment previously conducted the TA-16-399 Burn Tray was phased out utilizing waste minimization techniques and identifying other uses for explosives that were once treated as waste at this location.

Closure activities were conducted in accordance with the New Mexico Environment Department – Hazardous Waste Bureau (NMED-HWB) approved closure plan, *Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray, January 2019* (NMED, 2019a), and as amended (NMED, 2022a; NMED, 2023a; NMED, 2023b; and NMED, 2024). All additions and deviations are documented in this certification report. Triad National Security, LLC and the U.S. Department of Energy (together named as the Permittees) provide this certification report of the clean closure of the hazardous waste management unit at the TA-16-399 Burn Tray.

1.1 Description of the Unit

TA-16 is in the southwestern quadrant of the Facility at the west end of the Pajarito Plateau near the foothills of the Jemez Mountains. Elevation ranges from approximately 7,700 feet at the west end of the TA to approximately 6,800 feet at the lower east end. Topography is varied, ranging from steep canyon walls to sloping mesa tops. The open burning units at LANL are both located at the TA-16 Burning Ground and consist of the TA-16-388 Flash Pad and the TA-16-399 Burn Tray. The TA-16-388 Flash Pad is still in use today.

The TA-16-399 Burn Tray was comprised of a four-foot wide by 16-foot-long steel tray supported by 1.5-foot-high legs and was lined with firebricks. The maximum treatment capacity of the TA-16-399 Burn Tray was 1,000 pounds of waste per burn. The TA-16-399 Burn Tray was used to treat a single waste stream by open burning to destroy the characteristic of reactivity (D003). The bulk explosives of the waste stream included: cyclotrimethylene trinitramine (RDX); octahydro-1,3,5,7- tetranitro-1,3,5,7-tetrazocine (HMX); 2,4,6- trinitrotoluene (TNT); and triamino trinitrobenzene (TATB). Additionally, mixtures of explosives treated include ammonium nitrate-fuel oil (ANFO), Composition B, Cyclotol, IMX-101, PBX 9404, PBX 9407, PBX 9501, PBX 9502, PBX 9601, X0233, X0533, XTX 8003, XTX 8004, LX-02, LX-07, LX-10 and LX-14.

The waste explosives were packed in cardboard and wooden boxes and carefully transported to the unit for treatment. After the cover was rolled back from the tray, padding was placed on the tray while the explosives were removed from the boxes and set on the padding. The padding was then dampened with kerosene. Approximately one-half gallon of kerosene was used during each treatment event. Electric matches (*e.g.*, squibs) were then connected to the firing cables and a train of excelsior saturated with kerosene was run from the squibs to the padding for ignition. Ignition for all open burning treatment events occurred remotely from the control building. The waste was allowed to burn on its own accord while being observed from the control building. After the burn was complete, the tray was allowed to cool before the burn tray cover was put back in place. Any residue or remaining ash was removed from the tray no earlier than 24 hours after treatment. Treatment methods at this unit were consistent throughout the life of the unit.

The burn tray operated as a treatment unit prior to 1980 through July 18, 2012. Generally, treatment events ranged in volume from 30 pounds to 350 pounds. Since 1980, approximately 255,685 pounds of waste was treated at the TA-16-399 Burn Tray.

1.2 Closure Activities and Closure Plan Revision History

This discussion is provided to outline of the revisions necessary to the closure plan and closure activities. Closure activities, as outlined in the original closure plan (NMED, 2019a), were conducted from February 2019 through September 2019. Soil concentrations for data collected in 2019 were lower than the established residential soil screening levels when compared directly to the screening levels. However, risk assessments concluded that cumulative risk remained above residential risk levels. With the NMED-HWB approval, and prior to the submittal of the original closure certification report, further soil removal activities were conducted, and additional soil samples were collected within the excavated area and analyzed for explosives. The detected concentrations confirmed that the risk levels in the area associated with explosives were decreased. The report, *Transmittal of Closure Certification Report for Technical Area 16-399 Open Burn Unit Los Alamos National Laboratory EPA ID #NM0890010515*, was submitted on February 20, 2020 (LANL, 2020) to the NMED-HWB. The report included the risk assessment with cumulative risk calculations above residential screening levels, descriptions of soil removal activities, and subsequent sample collection that decreased cumulative risk calculations. The report concluded that potential risk posed to human health and several ecological risk receptors was acceptable. The NMED-HWB's review of the closure certification report (NMED, 2020), determined that revised risk assessments were necessary to determine if the results met clean closure requirements and included comments regarding the risk evaluations.

In response to the NMED-HWB's review and subsequent disapproval of the initial closure certification report, the Permittees prepared a report titled *Response to the Disapproval Closure Certification Report for Technical Area 16-399 Open Burn Unit, Los Alamos National Laboratory, EPA ID#NM0890010515* (LANL, 2021b) and submitted it to the NMED-HWB in March 2021. The revised risk assessment included addition of analytical data collected at the site from 2009-2013 and updated the risk analyses based on the larger amount of analytical data. The revised assessment calculated a human health cancer risk of 2E-05 and a Hazard Index (HI) for noncancer risk of 3. The NMED-HWB issued a second disapproval letter on May 25, 2021. The disapproval included further comments for consideration to potentially decrease the calculated risk levels. After integrating the NMED-HWB's comments into the risk

assessment and discussion with the NMED-HWB technical staff, it was determined that further soil removal was the best path forward to achieve clean closure expectations. On August 3, 2021, the NMED-HWB approved the proposed path forward of further soil removal (NMED, 2021c).

In November and December 2021, the Permittees excavated soil from two separate areas to remove soils with elevated concentrations of high explosives compounds and dioxins/furans, which were the identified contributors to the elevated risk. After soil removal, confirmation sampling demonstrated a decreased risk attributed to dioxins/furans in the overall area of the TA-16 Burning Grounds. However, unexpectedly high concentrations of barium and high explosives concentrations were present directly under the location of the former burn tray.

In early January 2022, the Permittees informed the NMED-HWB of the findings and proposed that an amendment to the closure plan was necessary to move forward due to the unexpected concentrations of explosives and barium within the fenced area at the unit. The Permittees provided formal notification of the closure plan amendment (LANL, 2022a), and after confirmation from the NMED-HWB (NMED, 2022a), a Class 2 permit modification was submitted and processed (LANL, 2022b and NMED, 2022b), resulting in the *Amended Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray, Revision 2*.

The planning and coordination of excavators, bins, trucks, and personnel to safely complete the closure activities outlined in Revision 2 of the closure plan took more time than anticipated. Additionally, scheduling of waste shipments, in coordination with space constraints for accumulation at the site and the disposal facility's ability to accept waste volumes, provided for additional complications to the project execution.

A total of 15 excavation events within the fenced area at the location of the former burn tray began on May 8, 2023, and the last excavation activity occurred on April 24, 2024. A total of 55 waste containers were sent to U.S. Ecology Nevada, Inc. in Nevada for treatment and disposal. Final soil verification sample collection occurred on May 14, 2024. Completion of the closure activities necessitated NMED-HWB approval of three additional requests for extension of time (NMED, 2023a; NMED, 2023b; and NMED, 2024).

This report, *Los Alamos National Laboratory Closure Certification Report for Open Burning Treatment Unit Technical Area 16-399 Burn Tray, Revision 1*, provides a summation of all field activities, soil laboratory analyses, and assessments performed to support clean closure of the open burning unit at the TA-16-399 Burn Tray.

2 Closure Performance

This section and subsections of this closure certification report include a description of the closure activities, deviations from the approved closure plan, results of sampling and analyses, treatment of the explosives-contaminated noncombustible debris, recycled materials, a summarization of disposition of waste, location of supporting documentation, and discussion of quality assurance and quality control. All closure activities were conducted in accordance with the approved closure plan (NMED, 2019a), and as amended (NMED, 2022a; NMED, 2023a; NMED, 2023b; and NMED, 2024). Additions and deviations from the closure plan are documented in this report.

2.1 Additions and Deviations from the Closure Plan

Because the closure plan was revised after some closure activities had been completed, the additions and deviations are described for each closure plan revision.

Descriptions of deviations from the approved plan are presented in the appropriate subsections, as indicated below. Discussions with NMED regarding the additions and deviations described in this closure certification report were conducted as presented in the extension requests, approvals, disapprovals, and responses to disapprovals included in referenced documents (LANL, 2019b; NMED, 2019c; LANL, 2019c; NMED, 2019d; NMED, 2020; LANL, 2021a; NMED, 2021a; LANL, 2021b; NMED, 2021b; LANL, 2021c; NMED, 2021c; NMED, 2022a; NMED, 2023a; NMED, 2023b; and NMED, 2024).

2.1.1 Deviations and Additions from Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray

The closure of the TA-16-399 Burn Tray was performed in accordance with the revised closure plan, except for additions and deviations from the approved closure plan, discussed in the following sections, to include:

- Notes regarding collection of tuff subsurface samplings as discussed in Section 2.2.3;
- Laboratory analytical method equivalencies (Section 2.2.4);
- Nitrate samples were not collected, and a duplicate sample was not collected in November 2021 (Section 2.2.3.1);
- Laboratory holding times which caused recollection of samples and missing analyte analysis (tetryl) (Sections 2.2.4 and 2.2.4.1.1);
- Three soil excavation events and subsequent soil sampling prior to revision of the approved closure plan (Sections 2.3, 2.4); and
- Inclusion of historic analytical information within the revised risk assessments (Section 2.5).

2.1.2 Deviations from Amended Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray, Revision 2

The following is a list of deviations and changes from the closure plan approved on September 6, 2022 (NMED, 2022b).

- Notes regarding collection of tuff subsurface samplings as discussed in Section 2.2.3;
- Confirmation of the analysis method for PFAS, which were added as constituents of concern due to public comment (Section 2.2.4); and
- A duplicate sample was not collected in November 2021 (Section 2.2.3.1).

2.2 Closure Activities

Closure activities for the TA-16-399 Burn Tray began on February 28, 2019, with the submittal of a request to initiate the collection of soil samples for analysis at an off-site analytical laboratory. Closure activities were performed in accordance with the approved closure plan and subsequent coordination with the NMED-HWB. Because of the amendment of the closure plan (NMED, 2022b), it was determined by the NMED-HWB that the collection of samples at all the closure plan identified locations would reoccur. The following provides a description of each activity proposed in the closure plan as well as additional closure activities and evaluations conducted to meet the closure performance standard.

2.2.1 Structural Assessment

As required by the closure plan, the structural assessment with the NMED-HWB was conducted on July 19, 2012. Correspondence (LANL, 2019a) regarding the structural assessment was sent to the NMED-HWB in February 2019 and included a commitment by the Permittees to include photographs of the TA-16-399 Burn Tray prior to removal within the closure certification report. On April 22, 2019, photographs were taken of the TA-16-399 Burn Tray and the surrounding area to document the state of the unit's physical condition prior to commencement of the removal of structures and equipment. Photographs 1 through 6 within Attachment 1, *Photographs Prior to Equipment/Structure Removal* of this closure certification report depict the undisturbed area.

2.2.2 Removal of Structures and Equipment

Demolition activities were systematically conducted on April 22, 2019. Electricity was confirmed to be de-energized at the electric box located directly in front of the TA-16-399 Burn Tray, then the burn tray equipment (including the electric box) was removed. The burn tray tracks, rubber matting under the tracks, burn tray cover, firebrick, and the burn tray were removed from the site and placed in waste containers or covered with tarps to be protected from weather according to the appropriate waste characterization for each item. A central accumulation area was set up for the waste items that required treatment via flashing at the TA-16-388 Flash Pad prior to disposal or recycling. Items that required treatment were the steel tray, firebrick, and sand. The concrete pad was broken up in place and placed in a pile for characterization. After sampling and analysis confirmed the debris was a non-hazardous waste, the concrete was disposed of at a construction and demolition landfill. Photographs 7 through 16 within Attachment 2, *Photographs of Removal of Equipment/Structures,* depict the area during and immediately after removal of the equipment and structures. All demolition activities were completed on April 22, 2019.

2.2.3 Soil Sampling

This section includes information regarding soil sample collection. Discussions associated with soil laboratory analysis are included in Section 2.2.4 and quality control/quality assurance in Section 2.7. Table 1, *Closure Plan Sample Locations Evaluated in Support of Closure Activities at the TA-16-399 Burn Tray*, provides a summary of all samples evaluated for use as part of this closure process. A description of the original reasoning for sample collection, as well as reasoning why a sample was not included in the risk evaluations are also provided in the summary table. Figure 2 includes a depiction of the locations ultimately included with the risk assessments. The soil sample collection procedures described herein only detail the activities conducted from 2019 to the present, as samples collected prior to that date may have followed different procedures and were not collected under the observation of the

independent professional engineer. All required subsurface samples were collected with the intention of reaching the tuff or the soil/tuff interface as much as practicable with an auger or a shovel. Final verification samples within the excavated area included crushed tuff, as the excavation in most areas reached tuff. While this is not considered a deviation from the approved closure plan, it is noted for context.

2.2.3.1 Soil Sampling

Eight soil sample collection events were conducted for the closure of the TA-16-399 Burn Tray. A duplicate sample was collected on each day of soil sample collection activities except for November 17, 2021, and April 24, 2024 (described in Section 2.4).

Initial soil sample collection was completed on May 7, 2019. As prescribed by the original closure plan, 16 soil samples (including one duplicate sample) were collected from 11 locations at and surrounding the TA-16-399 Burn Tray (Figure 1).

Due to the analytical laboratory's exceedance of holding times and unacceptable calculated relative percent difference in the initial laboratory soil analysis, resampling activities were conducted on August 6, 2019. 11 soil samples and a duplicate sample were collected to be analyzed for specific analytical suites. Section 4.2 of the approved closure plan required that completion of closure activities be conducted within 180 days of the beginning of closure. Closure activities for the unit began on February 28, 2019; however, due to the necessity to resample soils, a 30-day extension was requested and granted to complete closure activities by September 26, 2019 (LANL, 2019b and NMED, 2019c).

The third soil confirmation sample collection was completed on December 4, 2019, after soil was removed from a portion of the site as described in Section 2.3, *Initial Removal of Soil and Verification Sampling*.

The fourth and fifth soil sampling events occurred on November 17, 2021, and December 1, 2021, after soil was removed from two locations at the site as described in Section 2.4.1, *2021 Additional Removal of Soil and Verification Sampling*. Sixteen samples were collected from two excavated locations. Because the two excavations were not conducted on the same day, a duplicate sample on November 17, 2021, was inadvertently not collected. The sample locations within the excavated fenced area were later excavated as part of the 2023 and 2024 closure activities.

The final three soil sampling events occurred on August 16, 2023, October 26, 2023, and May 14, 2024. These soil samples were collected from 11 locations outlined in the original approved closure plan (NMED, 2019a), at and surrounding the TA-16-399 Burn Tray. Three locations were added as part of the revision of the approved closure plan (NMED, 2022a), as baseline locations for per- and polyfluoroalkyl substances (PFAS). Additional verification sample locations were also required as part of the revised closure plan (NMED, 2022a). On August 16, 2023, fifteen soil samples (including 1 duplicate sample) were collected from nine locations outside of the fenced area at the TA-16-399 Burn Tray. On October 26, 2023, 14 soil samples (including one duplicate sample) were collected from within the fenced area at five closure plan dictated locations, and seven chosen verification sample locations. Five locations for verification samples were within the excavated area, and two were located just outside the excavated area. Lastly, four soil samples were collected on May 14, 2024, after a final excavation was determined to be necessary to complete closure activities. Two soil samples were collected from former verification

sample locations, one sample from an additional location within the excavated area, and one sample outside the excavated area. A duplicate sample was not collected on this day.

All soil samples were collected as specified in the soil collection procedures outlined in Section 6.1.1 of the approved closure plan (NMED, 2019a) and subsequent amendments as appropriate (NMED, 2022a; NMED, 2023a; NMED, 2023b; and NMED, 2024). For surface soil sampling, a Bel-Art™ Sterileware™ Sampler Scoop was used to disturb the soil at the sampling location and a small portion of the soil to be sampled was visually examined by an Explosives Safety Officer and then a high explosives spot test was conducted on the soil. The scoop was used to fill sample containers per the analytical laboratory directions. For subsurface samples, a metal auger or shovel was used to remove approximately the necessary soil (usually 6 inches). The soil from approximately 6-12 inches below the ground surface was collected within a stainless-steel bowl and an Explosives Safety Officer visually inspected and then performed a high explosives spot test on the soil. A scoop was then used to fill sample containers as directed by the analytical laboratory requirements. All samples that tested positive for the high explosives spot test were managed and released from the area as explosives-contaminated material; however, the soils were determined to not present an explosive hazard. Soil samples collected for dioxin/furan analysis were sent to Cape Fear Analytical, LLC in Wilmington, North Carolina for analysis. All other soil samples (including those described in Sections 2.3 and 2.4) were sent to GEL Laboratories LLC in Charleston, South Carolina.

2.2.4 Laboratory Analysis

Section 6.1.2 of the closure plan lists specific methods within the U.S. Environmental Protection Agency (EPA) *Test Methods for Evaluating Solid Waste, Physical/ Chemical Methods* (SW-846) for conducting laboratory analyses. There were three deviations from those methods.

1. Metal analysis was conducted utilizing Methods 6020, 7471A, and 6010C. Method 6010B is listed in closure plan Table 4 with an allowance for approved updates.
2. Semi-volatile organic compound analysis was conducted utilizing Method 8270D, rather than 8270C. This is also an update to the method listed in closure plan Table 4.
3. Nitrate analysis was conducted using EPA Method 300.0 rather than Method 9056A. Both methods detect inorganic anions by ion chromatography and the method used is considered equivalent.

Additionally, PFAS analysis was conducted utilizing a modified version of the EPA Drinking Water Laboratory Method 537: Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS). A letter (LANL, 2023) sent to the NMED-HWB confirmed the use of this method.

Portions of the soil sampling were conducted a second time, as described in Section 2.2.3.1 of this report. Three volatile organic compound samples, four mercury samples, and two nitrate samples were resampled and analyzed to fulfill analytical requirements of the approved closure plan (NMED, 2019a). Two other planned nitrate resamples were inadvertently not collected during this time. However, because these samples were collected for the 2023-2024 closure activities, the detailed description of this deviation was removed from this report.

In addition, as described in Section 2.2.4.1.1, soil laboratory analytical results for tetryl in 2019 and 2020 were rejected and therefore were not included in any comparisons or the risk assessments. Analytical results for tetryl from past sampling events (2009, 2012, and 2013) and data from 2021, 2023 and 2024 are included as part of the human health and ecological risk assessments in Attachment 6 at the request of the NMED (NMED, 2020). Tetryl was not detected to be present at the site in any of the samples collected in 2009, 2012, 2013, 2020, 2021, 2023 and 2024, indicating that there is not likely tetryl present at the site. All data utilized in the analysis is present on the CD included as Attachment 4.

2.2.4.1 Data from Laboratory Analyses for Closure Plan Required Soil Samples

Soil laboratory analytical results are summarized in Attachment 3, *Summary of Analytical Data Utilized in Technical Area 16-399 Burn Tray Human Health and Ecological Risk-Screening Assessments Revision 3.0*, of this closure certification report. This table includes data utilized as part of the risk assessment analysis. Rejected data are not represented within the summary table but are included on the compact disc (CD) included as Attachment 4 and are discussed below. Detailed discussion about the detections that are above, or appear to be above, soil screening levels that require clarification are discussed within Attachment 6: *Technical Area 16-399 Burn Tray Human Health and Ecological Risk Screening Assessments, Revision 3.0*. Data tables for all data utilized within the risk assessments is present on the CD included as Attachment 4 for facilitating review. Additionally, Attachment 4 includes analytical data packages sent with the analytical data to the Permittees.

2.2.4.1.1 Analytical Discussion

Some other data points included in Table 1 require additional discussion for clarification. These data points are briefly discussed below. Additional detailed information and discussion regarding the full dataset utilized in the assessment for clean closure is included in the risk assessments (Attachment 6) and is present on the CD included as Attachment 4.

Samples analyzed for the compound tetryl were not analyzed by the analytical laboratory properly and were rejected. All the required spiking analytes were not within the acceptance limits in the laboratory control sample for tetryl and re-extraction was not performed because the samples exceeded the method stated holding time. Specific information regarding these laboratory quality issues is included on the CD (Attachment 4) within the data package for 2019-1826. Re-collection of samples to be analyzed for tetryl was not conducted as the control sample issues had not been resolved with the analytical laboratory at the time of resampling and likely, the results for the re-collected samples would duplicate the results of the original samples. However, soil samples were collected in August 2012 during the original anticipation of closure plan approval and while preparing a submitted permit modification request. Laboratory analytical results found no detections of tetryl in any of the soil samples collected at that time. The August 2012 soil sample locations are the same soil sample locations included within the closure plan that was sent out for public notice by the NMED-HWB in November 2013 that ultimately became the approved closure plan. While those data are not used as comparison values within this closure certification report, they are included on the CD included as Attachment 4 and indicate that tetryl is not present at the site.

All data packages received from the analytical laboratories are also included on the CD (Attachment 4). Analytical results, from this event as well as others, were further analyzed in human

health and ecological risk assessments included as Attachment 6 of this closure certification report. The risk assessments are discussed in Section 2.5.

2.3 Initial Removal of Soil and Verification Sampling

Based on the conclusions of the original risk assessments (discussed in Section 2.5), it was determined that soil should be removed at soil sample location 11, the location of the former concrete pad, where the soil concentration of RDX was detected at a concentration of 600 parts per million (ppm). Based on this determination, a second extension request was submitted and granted to complete closure activities by December 25, 2019 (LANL, 2019c and NMED, 2019d).

Soil removal was guided utilizing high explosive field tests and an Explosives Safety Officer to support the extent of the soil removal. On December 4, 2019, soil was excavated to a depth of 9-15 inches from an area measuring approximately 19 feet by 6.6 feet surrounding sample location 11. Approximately 125 cubic feet of soil was removed, sampled, and containerized to be characterized and disposed of off-site as hazardous waste due to barium concentrations. Photographs 17 through 21 within Attachment 6, *Photographs of Removal of Soil and Confirmation Soil Sampling Activities* depict the area during and immediately after removal of soil and depict an example of surface and subsurface soil sample collection.

On December 4, 2019, confirmation soil samples were collected from the newly excavated soil surface at the original soil sample locations and at each of the excavation boundaries. Additionally, at each of the four excavation boundaries, soil samples were collected from a depth of 6-12 inches below the excavated soil surface. All the soil samples were analyzed for high explosives constituents. Confirmation sample laboratory analytical results for RDX were compared to applicable NMED approved soil screening levels (SSLs) for residential risk screening scenarios, 8.31E+01 mg/kg (cancer) and 3.01E+02 mg/kg (non-cancer). All detected explosives constituent concentrations were below the applicable residential SSLs.

Established storm water controls and vegetation were left in place to ensure continued stabilization of the area and to prevent sediment from migration off-site. The excavation area was backfilled with base course and graded to match existing slope.

2.4 Additional Removal of Soil and Verification Sampling

After the second review of the risk assessments provided to the NMED-HWB, the Permittees received further comments regarding evaluations that could be conducted to reduce the calculated risk for the site. After conversation with the NMED-HWB and technical subcontract personnel, the Permittees proposed removal of soil from two locations within the unit boundary and south of the unit. The location south of the unit was identified as a location where higher levels of dioxin/furan congeners were previously measured. The location within the unit boundary was identified as a single location where a barium concentration was an order of magnitude greater than other measured concentrations within the area. However, it should be noted that barium is known to be above background values over the entire mesa top in this area.

The second soil removal effort occurred on November 17, 2021, south of the unit boundary in a drainage area. This is the location higher levels of dioxin/furan congeners were measured in past

sampling and analytical events (2012 and 2013). The area excavated is estimated to be 900 square feet and 8 to 12 inches deep. This is approximately 494.4 cubic feet of soil that was stored in a roll-off bin and shipped offsite as nonhazardous waste. Six verification samples were collected from the area and were analyzed for metals, high explosives, and dioxin/furan congeners. Analytical results showed no high explosives present in the area, two detections of barium above background values, and a decrease in the concentration of dioxin/furan congeners in the area. Because it was determined that there were not enough empty waste containers present at the site to provide containerization of the last excavation site, the final soil excavation was rescheduled. Due to the rescheduling, a duplicate field sample was inadvertently not collected on the second day.

On December 1, 2021, soil was removed from the area directly under the former location of the TA-16-399 Burn Tray. The excavated area measured approximately 33-34 feet in length and 15-20 feet in width to a depth of 11 to 18 inches. Approximately 974.68 cubic feet of soil was placed in three roll-off bins and 10 verification samples were collected from nine locations within the boundaries of the excavation. These samples were analyzed for metals, high explosives, and dioxin/furan congeners. Analytical results showed elevated concentrations of barium at the new soil surface and increased concentration of RDX in 2 of the 10 samples collected. Additionally, concentrations of aluminum, cadmium, calcium, chromium, copper, silver, and zinc were detected above background values within the excavated area. Additional explosives compounds detected include TNT, amino-2,6-dinitrotoluene [4-], amino-4,6-dinitrotoluene [2-], trinitrobenzene [1,3,5-], TATB, PETN, and HMX. Dioxin/furan congeners were detected in expected quantities for the area.

2.5 Excavation Activities After Amendment to Closure Plan

After an amendment to the approved closure plan (NMED, 2022b), additional excavation within the fenced area commenced on May 8, 2023. Fourteen excavation events took place while balancing the available areas for accumulation of waste containers, availability of waste containers, and ability of the off-site treatment and disposal facility to accept the waste that contained soil with non-detonable quantities of explosives and hazardous levels of barium. This resulted in the generation and shipment of 54, 20-cubic yard roll-off bins of contaminated soil and debris. Upon receipt of the analytical data from the October 26, 2023, soil sampling event, it was determined that an additional excavation event was necessary to complete closure activities. On February 15, 2024, NMED-HWB approved the final extension request for additional time to complete the final excavation event and collect final verification sampling (NMED, 2024). The excavation resulted in the generation of a final 20-cubic yard roll-off bin on April 24, 2024, for a total of 15 excavation events, and a total of approximately 15,930 cubic feet of waste shipped offsite. The final excavation will be backfilled with clean fill as soon as practicable. The fill will be graded to ensure that storm water control best management practices established at the site are still effective. Final verification sample collection took place on May 14, 2024. Figures 3, 4, and 5 depict the final concentrations of explosives, toxic equivalency (TEQ) values of dioxin/furan congeners, and other inorganic compounds. An additional figure depicting the few PFAS concentrations detected has been included as Figure 6 for completeness.

2.6 Risk Assessment

The risk assessments associated with the TA-16-399 Burn Tray were revised three times, based on recommendations of the NMED-HWB. Potential adverse risk at the site, as presented by the Permittees, is summarized in the following sections. Target levels for a residential risk scenario are an HI of 1 and a cumulative cancer risk of 1E-05.

2.6.1 Revision 0.0 in February 2020

The original risk assessments concluded that there was some potential risk to human health and several ecological receptors due to possible exposure to RDX. Risk assessments included with the closure certification report were based on the 16 soil samples collected from 11 locations as required by the approved revised closure plan (NMED, 2019a).

2.6.2 Revision 1.0 in February 2021

As required by the NMED-HWB (NMED, 2020), Revision 1.0 of the risk assessments included analytical data for organic and inorganic compounds at the site from 2009, 2012, 2013, 2019, and 2020.

The risk assessments included an evaluation of all the data recommended by the NMED-HWB and a more focused evaluation based on the area immediately surrounding the former location of the burn tray. The cumulative cancer risk based on all the datasets was 2E-05 and the noncancer HI was 3. When only the area surrounding the tray was evaluated, cumulative cancer risk was 1E-05 and the HI was 2. Lead was considered separately, and the hazard quotients for lead were less than 1 for all receptors. The ecological risk assessment concluded that there was some risk to several ecological receptors, but the calculated risk was relatively low, and data collected at the site showed no species impact.

2.6.3 Revision 2.0 in January 2024

Revision 2.0 of the human health and ecological risk assessments was not formally transmitted to the NMED-HWB, as it was determined that an amendment to the closure plan was necessary to complete clean closure activities. The revision included analytical data for organic and inorganic compounds at the site from 2009, 2012, 2013, 2019, 2020 and 2021 as required by the NMED-HWB (NMED, 2020), and as proposed by the Permittees (LANL, 2021c).

Analytical data for sample locations that were excavated were deleted from the risk assessment dataset and risk estimates were recalculated based on the revised dataset. Four organic analytes dropped out of the analysis because they were no longer detected, and two additional metals were carried forward as they were detected above background concentrations. Risk due to barium increased and hazard quotients (HQs) based on the refined exposure point concentrations were above 1 for construction worker scenarios. Risk due to two explosives increased based on the refined exposure calculations. Amino-2,6-dinitrotoluene [4-] HQs that were less than 1 were now 4 for the residential scenario based on the revised dataset, and 2,4,6 TNT concentrations also increased for the residential scenario and the HQ for residential use was now 2. Dioxin/furan cancer risks and HQs were now below target levels of 1E-05 and 1, respectively. Three analytes exceeded the migration to groundwater values based on refined exposure concentrations. These were barium, RDX, and 2,4,6 TNT. The cumulative cancer risk based on all the dataset was 2E-05 and the noncancer HI was 7.

Additionally, many maximum concentrations exceeded the ecological screening levels. Based on refined exposure concentrations, barium, selenium, amino-2,6-dinitrotoluene [4-], bis(2-ethylhexyl) phthalate, RDX, dioxin/furan congeners, and 2,4,6 TNT produced HQs above 1 for ecological receptors. Overall, these HQs were low, and the HIs were 2 or less for mammals and birds, 10 for soil fauna, and 50 for plants. The major risk driver for ecological risk receptors was barium and further excavation was deemed necessary.

2.6.4 Revision 3.0 in July 2024

After completion of the April 2024 excavation, the risk assessment evaluations were revised to include the data summarized in Attachment 3 of this closure certification report. Attachment 6, *Technical Area 16-399 Burn Tray Human Health and Ecological Risk Screening Assessments, Revision 3.0*, details the human health and ecological risk assessments for residual calculated risk at the site. Analytical data for sample locations that were excavated were deleted from the risk assessment dataset and risk estimates were recalculated based on the revised dataset. Table 1, Closure Plan Sample Locations Evaluated in Support of Closure Activities at the TA-16-399 Burn Tray, presents the soil samples included in the risk assessments.

Inorganics were compared to background value and risk-based soil screening levels. Six inorganics exceeded background values, and four of those exceeded background based on hypothesis testing. No inorganics exceeded human health risk-based screening levels. Several organics were detected, along with some explosives compounds and breakdown products, some semi-volatile organic compounds, and total petroleum hydrocarbons and diesel range organics. Maximum concentrations of detected analytes in surface soil were below industrial worker soil screening levels and maximum concentrations of the detected analytes in subsurface soils were below risk-based residential screening levels for all constituents except the dioxin/furans. Maximum concentrations were also below construction worker soil screening levels in subsurface soils.

When refined exposure point concentrations were considered, no constituents were above target levels for cancer risk or noncancer hazard for any receptor. The cumulative cancer risk based on refined exposure point concentrations for surface soils for industrial workers is 9E-07, and the noncancer HI is 0.04. The cumulative cancer risk based on refined exposure point concentrations for subsurface soils was 6E-06, and the HI was 0.6, for residents. The cumulative cancer risk and HI were below target levels for construction workers at 1E-07 and 0.4, respectively.

Refined exposure point concentrations for three detected analytes exceeded migration to groundwater screening levels. These were amino-2,6-dinitrotoluene [4-], amino-4,6-dinitrotoluene [2-], and RDX. There are also no maximum contaminant level drinking water standards for these three analytes. Detections for both amino-2,6-dinitrotoluene [4-] and amino-4,6-dinitrotoluene [2-] had so few detections that statistics are likely biased high. In addition, the distance to groundwater from the site provides for an unlikely source of addition of contamination to groundwater from explosives compounds. The facility includes an extensive facility-wide monitoring program that is well managed.

Although these screening levels were calculated to be exceeded, the site is deemed to be a low-priority source for its potential impact to groundwater. High- and moderate-ranking sources were characterized by significant hydrologic drivers, i.e., either large outfall volumes released to canyons or ponds located

on mesa tops. Sources were also characterized in terms of the release of large inventories or high contaminant concentrations. Both conditions are necessary to consider an area to have a high or moderate impact to groundwater. Therefore, the TA-16 Burning Ground area is ranked as a low-priority source for its potential to impact groundwater, because it lacks both a large contaminant inventory and a large volume of water to provide a hydrologic driving force for contaminant infiltration.

Concentrations of constituents also exceeded low-effect ecological screening level values for a few of these same constituents and receptors. Barium, selenium, and zinc exceeded values with HQs above 0.1. Concentrations for the explosive RDX; bis(2-ethylhexyl) phthalate; and dioxin/furan TCDD TEQ resulted in HQs above 0.1 for comparison to low-effect ecological screening levels. HIs were above 1 for all receptors except the American kestrel (*Falco sparverius*) modeled as a top carnivore or insectivore/carnivore, gray fox (*Urocyon cinereoargenteus*), also a top carnivore, mountain cottontail (Sylvilagus nuttallii), a mammalian herbivore, and earthworms.

After further refining of the population area use, there remain a few HQs above 0.1 for vertebrate receptors. HQs for barium were above 0.1 for earthworm and plants, HQs for selenium were above 0.1 for deer mouse and plants, HQs for RDX exceeded 0.1 for earthworm, and the HQs for TCDD TEQ exceeded 0.1 for montane shrew and deer mouse. The HI for deer mouse was 2, and the HI for plants was 6. The potential risk for plants is elevated due to barium; however, the area is generally kept free of much vegetation because of the nearby operating site adjacent to the former burn tray.

2.7 Disposal or Decontamination of Equipment, Structures, and Soils

Wastes generated from closure activities (i.e. sand, firebrick, metal, rubber, soil) were managed and have been disposed of as discussed in Section 2.2.2, Section 2.3, Section 2.4, and Section 2.5 in accordance with Section 7.0, *Waste Management* of the approved closure plan (NMED, 2019a). Scrap metal and other materials determined to be not explosives-contaminated by an Explosives Safety Officer through visual examination and high explosives spot tests were released for disposition from the High Explosives Area with no other required actions. Prior to shipment off-site for disposition, the firebrick, sand, and burn tray required treatment for explosives contamination at the TA-16-388 Flash Pad. Excavated soil from the site was disposed of at US Ecology Nevada, Inc. as explosives-contaminated hazardous waste. Most sampling equipment used (i.e. scoops, personal protective equipment) was disposable as nonhazardous waste and did not require decontamination. The auger, compositing bowl, and some scoops (as needed) were decontaminated utilizing Fantasik™ (a non-phosphate surfactant detergent that is already mixed with water) or deionized water and wipes. No excess liquid was used, and the waste wipes were disposed of as nonhazardous waste.

2.8 Location of Supporting Documentation

The following supporting documentation will be retained by the environmental waste compliance personnel at LANL.

- Field logs
- Laboratory sample analysis reports
- QA/QC documentation
- Chain-of-custody records

2.9 Statement of Quality Assurance/Quality Control Adequacy

A review of the sampling and shipping procedures and analytical data was conducted by environmental waste compliance personnel. Except for the caveats and the resampling event described in Sections 2.2.3.1 and 2.2.4.1.1, it was determined that the analytical data related to closure of the TA-16-399 Burn Tray are of an acceptable quality and should therefore be accepted as valid. Resampling rectified a percentage of the quality control issues with the initial analytical data. Other quality control issues can be refuted through inference about the site and historically collected data. Analytical data packages are included within Attachment 4 of this report.

3 Conclusions

Closure activities as described within this closure certification report demonstrate that closure was performed in accordance with the approved closure plan as well as additional activities as discussed with and approved by the NMED-HWB. Based on the conclusions of the risk assessments (Attachment 6), target levels for a residential risk scenario (cumulative cancer risk of 1E-05 and HI 1) have been achieved, and acceptable potential risk to ecological receptors remains at the site. After extensive soil removal activities were conducted at the site, contaminant concentrations measured in verification samples were found to be successful in reducing risk at the Unit.

The area at the overall site is well vegetated (see photographs included in Attachment 1), and there is no indication of an adverse effect at the site to plants or invertebrates, and as described in the risk assessment, there have been no observed effects for mammals and birds at the site based on various monitoring activities conducted at the site and referenced in the risk assessment (Attachment 6).

The site exists within the active, operational area of TA-16 and lies entirely on U.S. Department of Energy (DOE) land. The site is isolated from public access by a security fence and security checkpoints. Based on the current and proposed future land use, the site will remain under Facility (or DOE) control and will continue to be used for industrial purposes. Potential human exposure pathways include inhalation of airborne particles, incidental ingestion of surface soil or tuff, and dermal contact with surface soil or tuff. The potential on-site human receptors for both current and reasonably foreseeable future land use are LANL employees and for industrial land uses. However, residential land use is assumed to conservatively support closure certification decisions. Additional clean-up (e.g., soil removal) at the Unit is not recommended and the Unit should be approved for clean closure as defined within the approved closure plan (NMED, 2022b). For comparison purposes, a version of this closure certification report has been compared to the February 2020 report with red editing marks is included as Attachment 7 to this report.

4 Certification

This section presents a signed certification of the accuracy of this report as required by 40 CFR 270.11 and a certification by an independent registered professional engineer per 40 CFR 264.115.

4.1 Certification of Accuracy

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

4.2 Independent Registered Professional Engineer's Certification

This certification was prepared in accordance with generally accepted professional engineering principles and practice pursuant to the requirements of 40 CFR §265.115, for an independent registered professional engineer's certification. These services have been performed with the care and skill ordinarily exercised by members of the profession practicing under similar conditions at the same time and in the same manner or in a similar locality. No other warranty is either expressed or implied. The finding and certification are based on 1) reviewing the NMED-approved revised closure plans dated January 2019 and September 2022; 2) witnessing closure and sampling activities; and 4) reviewing the analytical results and certification report.

With the signature and seal below, I certify that, except for the variances presented in Section 2.2, the closure of the TA-16-399 Burn Tray at TA-16 was conducted in accordance with the NMED-approved revised closure plan. The information presented in this report is, to the best of my knowledge and belief, true, accurate, and complete.

Respectfully,

Pajarito Scientific Corporation

Eli V. Maestas
New Mexico Registered Professional Engineer No. 16643
Expires December 31, 2025
Date: August 22, 2024

NMED, 2021c. Approval Response to Second Notice of Disapproval Closure Certification Report and Proposed Actions for Technical Area 16-399 Open Burn Unit Los Alamos National Laboratory, EPA ID#NM0890010515, HWB-LANL-20-006. Letter. August 3, 2021. (http://permalink.lanl.gov/object/tr?what=info:lanl-repo/eprr/ESHID-603651)

NMED, 2022a. Request for Supplemental Information Request to Amend Closure Plan Open Burning Treatment Unit Technical Area 16-399 Open Burn Unit Los Alamos National Laboratory EPA ID#NM0890010515 HWB-LANL-20-006. Letter. April 8, 2022. (https://srorlgreen.lanl.gov/object/tr?what=info:lanl-repo/eprr/ESHID-603691)

NMED, 2022b. Approval with Modifications Request for Class 2 Amendment to the Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray Los Alamos National Laboratory EPA ID#NM0890010515 HWB-LANL-22-039. Letter. September 6, 2022. (https://srorlgreen.lanl.gov/object/tr?what=info:lanl-repo/eprr/ESHID-603717)

NMED, 2023a. Approval Extension of Time for Class 1, With Prior Approval, Permit Modification, Amended Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray, Revision 2, September 2022, Los Alamos National Laboratory EPA ID#NM0890010515 HWB-LANL-23-012. Letter. March 10, 2023. (https://srorlgreen.lanl.gov/object/tr?what=info:lanl-repo/eprr/ESHID-603754)

NMED, 2023b. Modified Approval Class 1 Permit Modification Request to Amend the Closure Plan Schedule for Technical Area 16-399 Open Burn Unit, Revision 2.1 Los Alamos National Laboratory EPA ID#NM0890010515 HWB-LANL-23-050. Letter. September 6, 2023 (https://srorlgreen.lanl.gov/object/tr?what=info:lanl-repo/eprr/ESHID-603790)

NMED, 2024. Approval Class 1 Permit Modification Request to Amend the Closure Plan Schedule for TA-16-399 Burn Tray, Revision 2.2 Los Alamos National Laboratory EPA ID#NM0890010515 HWB-LANL-24-005. Letter. February 15, 2024. (https://srorlgreen.lanl.gov/object/tr?what=info:lanl-repo/eprr/ESHID-603821)

Table 1. Closure Plan Sample Locations Evaluated in Support of Closure Activities at the TA-16-399 Burn Tray

Year	Sample ID	Location Comment	Analysis Conducted	Depth in Inches	Reason for Sample Collection	Removal Reason - Other Comments
2009	09RCRA695	West of Closure Plan Location #10	Dioxin/Furans	0-2	Site characterization	
2009	09RCRA696	West of Closure Plan Location #10	Metals	0-2	Site characterization	
2009	09RCRA697	Approximate same as Closure Plan Location #10	Dioxin/Furans	0-2	Site characterization	
2009	09RCRA698	Approximate same as Closure Plan Location #10	Metals	0-2	Site characterization	
2009	09RCRA699	North of Closure Plan Location #1	Dioxin/Furans	0-2	Site characterization	
2009	09RCRA700	North of Closure Plan Location #1	Metals	0-2	Site characterization	
2009	09RCRA701	West of 09RCRA706 across road	Dioxin/Furans	0-2	Site characterization	
2009	09RCRA702	West of 09RCRA706 across road	Metals	0-2	Site characterization	
2009	09RCRA703	South of 09RCRA706	Dioxin/Furans	0-2	Site characterization	

Table 1. Closure Plan Sample Locations Evaluated in Support of Closure Activities at the TA-16-399 Burn Tray

Year	Sample ID	Location Comment	Analysis Conducted	Depth in Inches	Reason for Sample Collection	Removal Reason - Other Comments
2009	09RCRA704	South of 09RCRA706	Metals	0-2	Site characterization	
2009	09RCRA705	West of Closure Plan Location #1 other side of the road	Dioxin/Furans	0-2	Site characterization	
2009	09RCRA706	West of Closure Plan Location #1 other side of the road	Metals	0-2	Site characterization	
2009	09RCRA707	Just south of Closure Plan Location #1	Dioxin/Furans	0-2	Site characterization	
2009	09RCRA708	Just south of Closure Plan Location #1	Metals	0-2	Site characterization

Year	Sample ID	Location Comment	Analysis Conducted	Depth in Inches	Reason for Sample Collection	Removal Reason - Other Comments
2023	SFB-23-295645	Verification 1	Metals, Dioxins/Furans, High Explosives, SVOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	Excavated surface	Confirmation sample after soil excavation	Removed and replaced by SFB-24-323271
2023	SFB-23-295646	Verification 2	Metals, Dioxins/Furans, High Explosives, SVOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	Excavated surface	Confirmation sample after soil excavation	Removed and replaced by SFB-24-323272
2023	SFB-23-295647	Verification 3	Metals, Dioxins/Furans, High Explosives, SVOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	Excavated surface	Confirmation sample after soil excavation	
2023	SFB-23-295648	Verification 4	Metals, Dioxins/Furans, High Explosives, SVOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	Excavated surface	Confirmation sample after soil excavation	
2023	SFB-23-295649	Verification 5	Metals, Dioxins/Furans, High Explosives, SVOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	Excavated surface	Confirmation sample after soil excavation	

Table 1. Closure Plan Sample Locations Evaluated in Support of Closure Activities at the TA-16-399 Burn Tray

Year	Sample ID	Location Comment	Analysis Conducted	Depth in Inches	Reason for Sample Collection	Removal Reason - Other Comments
2023	SFB-23-295650	Verification 6	Metals, Dioxins/Furans, High Explosives, SVOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	At Depth 9-15 inches	Confirmation sample after soil excavation	
2023	SFB-23-295651	Verification 7	Metals, Dioxins/Furans, High Explosives, SVOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	At Depth 9.5-15 inches	Confirmation sample after soil excavation	
2024	SFB-24-323271	Verification 1	Metals, Dioxins/Furans, High Explosives, VOC, SVOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	0-6	Excavated surface	Replaces SFB-23-295645.
2024	SFB-24-323272	Verification 2	Metals, Dioxins/Furans, High Explosives, VOC, SVOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	0-6	Excavated surface	Replaces SFB-23-295646.
2024	SFB-24-323273	Verification 8	Metals, Dioxins/Furans, High Explosives, SVOC, VOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	0-6	At edge of excavated area.	New sample location collected from the new surface level.

Table 1. Closure Plan Sample Locations Evaluated in Support of Closure Activities at the TA-16-399 Burn Tray

Year	Sample ID	Location Comment	Analysis Conducted	Depth in Inches	Reason for Sample Collection	Removal Reason - Other Comments
2024	SFB-24-323274	Verification 9	Metals, Dioxins/Furans, High Explosives, SVOC, VOC, Perchlorate, Gas Range Organics, Diesel Range Organics, Nitrate, PFAS	10-12	Outside of excavated area.	New at-depth sample location.

EXECUTIVE SUMMARY

The area around the open burn (OB) unit at Technical Area 16-399 (TA-16-399) Burn Tray (the Unit) within the Los Alamos National Laboratory (LANL) boundary was sampled for numerous hazardous constituents. Surface and subsurface soil and tuff samples were collected in May and August 2019 and analyzed for inorganic and organic compounds. Historic data from 2009, 2012, and 2013 were also included and evaluated in this risk assessment. Samples located within excavated areas and the soil removal area are not included in the risk assessment; however, confirmation samples collected in December 2019 located at the bottom of the excavated area are included in the analysis as well as confirmation samples from 2021. Sampling, following excavation activities in 2023 and 2024, also provided data for this risk assessment. Data from all of these sample events were used to conduct human health and ecological risk-screening assessments.

For the human health risk-screening assessment, residential, construction worker, and industrial exposure scenarios were evaluated by comparing the maximum exposure point concentration for each analyte to the New Mexico Environment Department (NMED) soil screening levels (NMSSLs). Soils were characterized by depth into surface (0 to 1 foot) and subsurface (0 to 10 foot) intervals. The deepest soil samples were collected at 1.25 feet. The surface soils were evaluated for risk to industrial workers, whereas the subsurface soil was evaluated for risk to hypothetical future residents and construction workers. The following conclusions are made:

- Inorganics were compared to background values (BVs) and risk-based screening levels (SLs).
    - Six inorganics in the surface and subsurface soil intervals (i.e., barium, cadmium, copper, selenium, silver, and zinc) exceeded their respective BVs.
    - Of these, barium, selenium, silver, and zinc were statistically above background based on statistical evaluation of the surface and subsurface soil intervals.
    - There were no BVs for nitrate, nitrate as nitrogen, or perchlorate, and they were retained for risk analysis.
    - Silver data for the upper soil horizon for background were not available and so hypothesis tests were performed with data for the upper and lower tuff layer, and silver was retained on the basis of hypothesis testing.
    - Maximum concentrations of inorganics in both the surface and subsurface soils were less than risk-based NMSSLs.
    - Maximum concentrations of barium exceeded the migration to groundwater SL-SSL values.
- Detected organics were compared to risk-based SLs. There were several organics detected, including some energetics and breakdown products, dioxin/furans, some semivolatile aromatic hydrocarbons (SVOCs), and petroleum hydrocarbon diesel range organics (TPH DRO).
    - No analytes exceeded NMSSLs in surface soil.
    - The dioxin/furans were the only organics for which maximum concentrations exceeded risk-based NMSSLs in subsurface soil.
    - Maximum concentrations of amino-2,6-dinitrotoluene[4-], amino-4,6-dinitrotoluene[2-], and RDX in both surface and subsurface soil exceeded the migration to groundwater SL-SSL.
- The cumulative cancer risk (CCR) for residential use based on the maximum detected values was 5E-05. The CCR based on the maximum detected concentration was 1E-05 for industrial and 1E-06 for construction workers. Dioxin/furans were the largest contributor to the CCR.

- The Hazard Index (HI) for residential use based on the maximum detected values was 5. The HI based on maximum detected concentrations for the construction worker scenario was 2. The HI for the industrial worker was less than 1.

The upper 95th percent confidence limit (UCL95) was used to estimate the refined exposure point concentration (EPC) in order to recalculate the CCR and HI. The refined EPCs were used to estimate cancer risk and noncancer hazard for each of the evaluated human health receptors, with the following results:

- The CCR for residential use based on a UCL95 was 6E-06, below the target cancer risk threshold of 1E-05. The HI based on the UCL95 for the residential use scenario was 0.6, less than the target hazard index of 1, and indicating no noncancer hazard for hypothetical residential use.
- Based on the refined (UCL95) EPC, CCR for the industrial worker exposed to surface soil was 9E-07. Noncancer HIs based on UCL95 values used as the EPC were less than 1 for industrial workers.
- CCR for the construction worker receptors exposed to subsurface soil was 1E-07. Noncancer HIs based on UCL95 values used as the EPC were less than 1 for construction workers.
- There is no elevated cancer risk or noncancer hazard for worker receptors exposed to surface or subsurface soil.
- Refined EPCs for three detected analytes exceeded migration to groundwater screening levels. These were amino-2,6-dinitrotoluene[4-], amino-4,6-dinitrotoluene[2-], and RDX. Migration to groundwater NMSSLs were exceeded, however, the site is deemed to be a low-priority source for its potential impact to groundwater. There are no maximum contaminant level (MCL) drinking water standards for these three analytes.
- Based on this analysis, there is no potential human health cancer risk or noncancer hazard for a hypothetical future resident, industrial worker, or construction worker, due to potential exposure at the Unit.

Potential risk to ecological receptors was evaluated by analyzing different lines of evidence that were weighed to draw a conclusion regarding potential for adverse ecological effects. This included:

- Comparing maximum detected EPCs to no effect (NE) ecological screening levels (ESLs) to obtain no effect HQs.
- Comparing upper 95th percentile confidence limit EPCs to low effect (LE) ESLs to obtain low effect HQs.
- Calculating hazard indices, which are the sum of the HQs.
- Consideration of historic site-specific biological sampling.
- Application of site-specific population area use factors (PAUFs).

Maximum detected concentrations of several explosives (HMX, RDX, TATB, TNT), acenaphthene, benzoic acid, bis(2-ethylhexyl)phthalate, di-n-butylphthalate, dioxin/furans, TPH DRO, and some inorganics (i.e., barium, , selenium, silver, and zinc) exceeded NE ESLs with HQs above 0.1 in the initial evaluation of maximum concentrations to the minimum ESL. HIs based on maximum detected concentrations and the NE ESLs for individual receptor species were above 1 for most of the receptors (American kestrel (avian intermediate carnivore), American robin (avian herbivore), American robin (avian omnivore), American robin (avian insectivore), gray fox (mammalian top carnivore), mountain cottontail (mammalian herbivore), montane shrew (mammalian insectivore), deer mouse (mammalian omnivore), earthworm (soil-dwelling invertebrate), and generic plant (terrestrial autotroph-producer)).

Refined EPCs based on the UCL95 concentrations exceeded LE ESL values for a few of these same constituents and receptors. Barium, selenium, and zinc refined EPCs exceeded LE ESLs with HQs above 0.1. Refined EPCs for the explosive RDX; bis(2-ethylhexyl)phthalate; and dioxin/furan TCDD TEQ resulted in HQs above 0.1 for comparison to LE ESLs. HIs were above 1 for all receptors except the American kestrel (*Falco sparverius*) modeled as a top carnivore or insectivore/carnivore, gray fox (*Urocyon cinereoargenteus*), also a top carnivore, mountain cottontail (*Sylvilagus nuttallii*), a mammalian herbivore, and earthworms.

When exposure estimates were adjusted to account for the species home range by application of the population area use factor (PAUF) based on a site area of 2 ac (0.8094 ha), barium and selenium for deer mouse, plants, and earthworms produced HQs above 0.1. Zinc HQs were above 0.1 for plants and earthworms. The dioxin/furan TCDD TEQ exceeded NE ESLs for deer mouse and shrew with HQs above 0.1. HQs were above 0.1 for bis(2-ethylhexyl)phthalate for robin modeled as an omnivore or insectivore; RDX for earthworms and robin modeled as a herbivore or omnivore; TATB for earthworms; and TPH DRO for plants. The HI for the receptors based on NE ESLs and PAUFs for robin as insectivore was 2, the HI for montane shrew was 4, deer mouse was 9, and for earthworms and plants the HIs were 6 and 10, respectively.

The LE ESLs were compared to the refined UCL95 EPCs and adjusted with a PAUF based on the site area. There were few HQs above 0.1 for vertebrate receptors. HQs for barium were above 0.1 for earthworm and plants, HQs for selenium were above 0.1 for deer mouse and plants, HQs for RDX exceeded 0.1 for earthworm, and the HQs for TCDD TEQ exceeded 0.1 for montane shrew and deer mouse. The HI for deer mouse was 2, and the HI for plants was 6.

The small mammal tissue study indicated little uptake of dioxins/furans by small mammals at TA-16 as a whole, as well as little effect on mammal populations. Population metrics for birds were not statistically significantly different from controls.

Based on the soil dataset, there is minimal risk to ecological receptors for exposure to soils identified as the result of this screening analysis. The HIs for most of the ecological receptors based on exposure adjusted with PAUFs, refined EPCs, and LE ESLs are less than 1. The HIs are low and well within the expected error for the analysis. The potential risk for plants is elevated due to barium; however, the area is generally kept free of much vegetation because of the nearby operating site that will be used for the foreseeable future. This reduces the potential for plants to be receptors, and also minimizes habitat and food for small mammal receptors (i.e., reduces the potential for deer mice to be chronically exposed).

The Preliminary Remedial Goals (EcoPRGs) for barium for plants is 1400 mg/kg, which is higher than the refined EPC for the Unit of 1363 mg/kg. The EcoPRG for dioxin/furans is 0.000032 mg/kg, which is higher than the refined EPC of 0.0000188 mg/kg. The EcoPRGs for selenium and RDX were also higher than the refined EPCs. Because the measured EPCs for the major risk drivers are below applicable EcoPRGs, further evaluation of this Unit is not required.

Overall, the Unit does not pose an unacceptable risk to human health or ecological receptors, and it is recommended for clean closure in accordance with the Closure Plan, based on the closure performance standard (residential clean-up levels) outlined in the Closure Plan as well as the LANL Hazardous Waste Facility Permit.

1. INTRODUCTION

Technical Area -16 (TA-16) is located in the southwestern portion of LANL at the west end of the Pajarito Plateau near the foothills of the Jemez Mountains (Figure 1-1). The TA-16 Burn Ground consists of the TA-16-388 Flash Pad and the TA-16-399 Burn Tray co-located with several Solid Waste Management Units in the immediate area. Only the TA-16-399 Burn Tray (the Unit) is addressed by this risk assessment conducted in support of *Final Action and Response to Comments Closure Plan for Technical Area 16-399 Open Burn Unit, Los Alamos National Laboratory, EPA ID #NM0890010515* (Closure Plan). The surface media at the TA-16 Burn Ground includes soil, debris, vegetation, and rocks. Only soil was sampled for this investigation.

The Unit is located in the northeast portion of TA-16. Elevation ranges from approximately 7,700 feet at the west end of the TA to approximately 6,800 feet at the lower east end. Topography varies from steep canyon walls to sloping mesa tops. The open burn (OB) units were managed by the high explosives (HE) engineering personnel who were responsible for the safe treatment, storage, and handling of HE waste and HE contaminated wastes generated by the HE production facilities at LANL. The Unit was a 4-ft by 16-ft covered steel tray lined with firebricks and supported by 1.5-ft high legs on wheels with tracks. It included a concrete pad with an electrical panel and is surrounded by a chain-link fence. The maximum treatment capacity of the Unit was 1000 pounds of waste per burn.

The Unit was used to treat a single waste stream by open burning to destroy the characteristic of reactivity (D003). The bulk of explosives in the waste stream were: octahydro-1,3,5,7- tetranitro-1,3,5,7-tetrazocine (HMX); cyclo-1,3,5-trimethylene-2,4,6-trinitramine (RDX): 2,2-bis[(nitroxy)methyll-1,3-propanediol dinitrate (PETN); 2,4,6-trinitrotoluene (TNT); and triamino trinitrobenzene (TATB). Additionally, mixtures of explosives including ammonium nitrate-fuel oil (ANFO), Composition B, Cyclotol, IMX-101, PBX 9404, PBX 9407, PBX 9501, PBX 9502, X0233, X0533, XTX 8003, XTX 8004, LX-02, LX-07, LX-10, and LX-14 were treated. Records of waste treated at the Unit from 1951 to1980 were not available, and therefore analysis of target analyte metals, nitrates, perchlorate, volatile organic chemicals (VOCs), semi volatile organic chemicals (SVOCs), petroleum hydrocarbon diesel range organics (DRO), petroleum hydrocarbon gasoline range organics (GRO), dioxins/furans, and HE degradation products were added to the analytical suite required by the Closure Plan.

Sampling to identify potential contaminants was conducted in May and August 2019 in accordance with the Closure Plan. Sampling from past activities in 2009, 2012, and 2013, as well as samples collected post soil excavation (December 2019) have been included in this revised assessment per direction by the New Mexico Environment Department- Hazardous Waste Bureau (NMED-HWB) in correspondence dated November 18, 2020. Additional samples were collected in August and October, 2023 following excavation, and soil sampling was performed again in May, 2024 after limited excavation to remove soils containing elevated levels of RDX. Samples collected in 2009, 2012, 2013, and 2020 were not analyzed for all parameters. The 2023 and 2024 samples added per- and polyfluoroalkyl substances (PFAS) to the analytical list. The relevant analytical data for those sample collection events are included to support site characterization in evidence of meeting the closure performance standard within Section 4.1, *Closure Performance Standard* of the Closure Plan.

Human health and ecological risk-screening assessments were conducted using the soil samples mentioned above. NMED (2022) guidelines use 0 to 1 foot depth for industrial worker SL and 0 to 10 foot depth for residential and construction worker SLs. For ecological receptors, surface soil is considered to be 0 to 1 foot for non-burrowing animals and shallow rooted plants, and 0 to 6 feet for burrowing animals and deep rooted plants. For this project, all soil samples were collected from 0 to 1.25 feet below

ground surface (bgs). This data set is representative of site conditions; however, it is a depth limited dataset. Apart from the excavated area within the fence line, very little soil exists at the site. The results of the risk-screening assessments are presented in the following sections.

1.1. CONCEPTUAL SITE MODEL

The primary land use is industrial because only authorized Laboratory workers currently have access to the area around the TA-16 Burn Ground. Laboratory workers are the primary human receptors, and the industrial scenario is the defining scenario for the human health risk-screening assessment (i.e., the scenario on which decisions are based). Because the site is located within the boundaries of an operational facility (TA-16), the reasonably foreseeable future land use will continue to be industrial. A Hypothetical Future Residential and a construction worker exposure are also assessed and provided for comparison purposes.

The release of contaminants from open burn operations has occurred for more than 50 years. Releases are transported primarily by wind, which rapidly disperses the material in ambient air. Most material is deposited close to the source(s) and concentrations decrease with distance from the source. Exposure to a site worker may occur through various surface soil contact pathways. Data for both surface and subsurface soil depths were combined for the human health risk assessment. The exposure interval for industrial workers is 0 to 1 foot below ground surface (bgs), and 0 to 10 feet bgs for residential use and construction workers. Since all data fall within 0 to 1 foot, the available data set was used for all receptors.

Potential exposure pathways are:

- Incidental ingestion of surface soil
- Inhalation of fugitive dust or volatiles emanating from surface soil
- Dermal contact with surface soil

The primary ecological exposure pathways are also based on direct or indirect contact with surface soils. These include root uptake, incidental ingestion of soil, and biotic uptake leading to food-web transport. Exposure of plants and soil invertebrates is not related to dietary pathways but is the result of direct contact with, and uptake from, the surrounding medium. For terrestrial wildlife, most exposure is through the oral pathway from the diet and incidental ingestion of soil (Sample et al. 1998). The dermal contact and inhalation pathways are not typically assessed quantitatively in ecological risk assessments, based on guidance indicating the ingestion route is most important to terrestrial animals (EPA 1997; EPA 2003). Dermal exposure to wildlife is mitigated by the fur or feathers covering the bodies of most vertebrates and the incidental consumption of soil during grooming is included in the direct soil ingestion estimates.

Respirable dust particles are most likely ingested rather than inhaled, and this pathway is negligible (EPA 1997; EPA 2003), while non-respirable dust is ingested and accounted for in incidental soil ingestion values for wildlife species (EPA 1993; EPA 2003). Therefore, the exposure pathways considered in the development of the ecological screening levels (ESLs) used in the risk-screening assessment capture the primary exposure for wildlife receptors, which are soil and dietary ingestion.

Grazing animals are not considered to be a potential pathway of exposure for human health. Per NMED (2022) cattle must be considered to determine if beef ingestion is a likely exposure pathway on sites greater than 2 acres in size. The total area where all of the samples were collected is approximately 2 acres. This is equivalent to 0.8 hectare (ha). The area within the SWMU boundary is 0.64 ac (0.26 ha). The fence provides some deterrence of animals into the area. The dominant land cover type around the

unit is a ponderosa pine (*Pinus ponderosa*) forest with a shrub component of Gambel oak (*Quercus gambelii*) and mountain mahogany (*Cercocarpus montanus*). Large game animals are common in the forested areas around the Unit. Within the Unit, ground cover is primarily comprised of rocky or bare soil with plants dispersed irregularly. The plant species present are mostly early successional species, often non-native, that tend to do well in disturbed habitats, including cheatgrass (*Bromus tectorum*), rubber rabbitbrush (*Ericameria nauseosa*), broom snakeweed (*Gutierrezia sarothrae*) and common mullein (*Verbascum thapsus*). Large mammals lack adequate cover, forage, or water at the Unit and generally stay out of the area.

1.2. RISK ASSESSMENT DATASET

The risk assessment dataset contains current and historical data. Twelve surface soil samples including one duplicate were collected in May and August 2019 for a total of 11 grid points sampled. Soil samples were collected as grab samples (independent, discrete samples) from a depth of 0 to 2 inches below ground surface and 2 to 12 inches.

Data were collected in 2023 following excavation of various locations with high barium and explosives concentrations. PFAS samples were collected in 2023 to serve as a baseline. An additional 28 samples were collected in August and October of 2023 including closure plan samples and confirmation samples. Samples ranged from 0 to 6 inches and 6 or 9 to 15 inches in depth (Table 1-1).

Following data analysis, two samples were excavated and an additional four confirmation samples were collected in May 2024 and added to the risk assessment dataset. Samples were analyzed for the following:

- Volatile Organic Compounds (VOCs)
- Semi-Volatile Organic Compounds (SVOCs)
- Total Metals
- Dioxins/Furans
- Perchlorate
- High Explosives and Degradation products
- Nitrates
- DRO and GRO
- PFAS

In addition, inorganics and dioxin/furan samples from 2009, as well as samples of inorganics and organics from 2012 and 2013, were included in the risk assessment dataset. High explosives samples were collected in 2020 from an area at the site where soil was excavated to ensure removal of explosives contamination. Data from 16 samples collected from excavations in 2021 were added to the risk assessment dataset for metals, high explosives, and dioxin/furan congeners after two additional excavations of soil at the site.

Figure 1-1 shows a map of the site including excavations areas and all sampling locations from which data were obtained for use in the risk assessment. Figures 1-2, 1-3, and 1-4 depict concentration maps for various constituents that are helpful to see spatially.

The samples collected by date that remain in the risk assessment dataset are reported in Table 1-1.

2. HUMAN HEALTH RISK ASSESSMENT

2.1. IDENTIFICATION OF CHEMICALS OF POTENTIAL CONCERN

2.1.1. Comparison of Inorganic Analytes to Background

Inorganic analytes are first compared to background values (BV) established for the site (LANL 1998). No further evaluation is necessary for analytes for which the maximum is less than the BV, and these data are not compared to NMED (2022) risk-based soil screening levels (NMSSLs). Organic analytes are not compared to background values as a matter of standard practice, although there are naturally occurring sources of organic constituents. For those analytes above BV, statistical hypothesis testing is performed by comparing the site data to the LANL background dataset for the soil horizons. A Wilcoxon-Mann-Whitney test was performed to determine if site data were statistically elevated above background, unless there were too many multiple detection limits, in which case a Gehan test was performed.

2.1.2. Comparison of Maximum EPCs to NMSSLs

Maximum concentrations of all detected analytes are compared to NMSSLs (Table 2-1). Some organic analytes (2,4- and 2,6- dinitrotoluene, dinitrobenzenes) were chemically analyzed by more than one method, resulting in an apparently higher sample count (Table 2-2). The presence of duplicate samples also could provide one sample that is higher than the other. The maximum concentration regardless of the method was used as the maximum exposure point concentration (EPC), which is the environmental concentration to which the receptors are potentially exposed. Field duplicates, but not field trip blanks, were included in the data analysis for determining maximum concentrations.

2.1.3. Surrogates

Where an NMSSL was not available, the USEPA Regional Screening Level (RSL) for residential soils was applied as an SL for residential use, and the RSL for industrial commercial soil was used as the SL for industrial and construction workers. Cancer-based RSLs were adjusted to a cancer risk (CR) level of 1E-05 by multiplying the RSL by 10; noncancer RSLs were based on a hazard quotient (HQ) of 1. If an RSL was also not available, a suitable surrogate is proposed if physicochemical data suggest identifying a suitable surrogate. Most of the surrogates are proposed for nondetected analytes in order to verify that method detection limits (MDLs) are suitable for performing risk assessment. Surrogates were obtained for the following analytes because NMSSLs were not available (Table 2-1); note that most of these analytes are not detected, and the NMSSL or surrogate is used to verify reporting limits are adequate:

- 2,4-Diamino-6-nitrotoluene – There is no NMSSL or RSL. Use o-nitrotoluene RSLs, which has both cancer and noncancer RSL values, and the lowest of the nitrotoluene isomer cancer RSLs.
- 2,6-Diamino-4-nitrotoluene – Use o-nitrotoluene RSLs, which has both cancer and noncancer RSL values, and the lowest of the nitrotoluene isomer cancer RSLs.
- 3,5-Dinitroaniline – There is no NMSSL. The amino-4,6-dinitrotoluene[2-] NMSSL was used as a surrogate based on structural similarity.
- Acenaphthylene – There is no NMSSL or RSL. The NMSSLs for pyrene were used as a surrogate based on structural similarity.
- Aniline - There is no NMSSL. The RSLs were used as a surrogate.
- Azobenzene - There is no NMSSL. The RSLs were used as a surrogate.
- Benzo(g,h,i)perylene – There is no NMSSL or RSL. The NMSSLs for pyrene were used as a surrogate.

- Benzoic Acid - There is no NMSSL. RSLs were used as a surrogate.
- Benzyl Alcohol- There is no NMSSL. RSLs were used as a surrogate.
- Bis(2-chloroethoxy)methane- There is no NMSSL. RSLs were used as a surrogate.
- Bromobenzene - There is no NMSSL. RSLs were used as a surrogate.
- Bromochloromethane - There is no NMSSL. RSLs were used as a surrogate.
- Bromophenyl-phenylether[4-] – There is no NMSSL or RSL. The RSL for pentabromodiphenyl ether was used.
- Butylbenzene isomers – There are no NMSSLs. The RSLs are used as surrogates.
- Butylbenzylphthalate – There are no NMSSLs. The RSLs are used as surrogates.
- Chloro-3-methylphenol[4-]– There are no NMSSLs. The RSLs are used as surrogates.
- Chloroaniline[4-] – There are no NMSSLs. The RSLs are used as surrogates.
- Chlorophenyl-phenyl[4-] Ether– There is no NMSSL or RSL. No recommendation for a surrogate is made.
- Chlorotoluene[4-] – Use the NMSSLs for the o-chlorotoluene isomer because the RSLs for the two isomers are the same.
- Dibenzofuran – There are no NMSSLs. The RSLs are used as surrogates.
- Dichlorobenzene[1,3-] – There is no NMSSL or RSL. The NMSSLs for 1,4-dichlorobenzene were used as it may be the more toxic isomer considering it has cancer-based as well as noncancer-based endpoints.
- Dichloropropane[2,2-] – There is no NMSSL or RSL. The NMSSLs for 1,2-dichloropropane were used. The RSL is higher for 1,3 than 1,2 dichloropropane, and therefore this is considered conservative.
- Dichloropropane[1,3-] – There is no NMSSL. The NMSSLs for 1,2-dichloropropane were used.
- Dichloropropene[1,1-] – There is no NMSSL or RSL. The NMSSLs for 1,3-dichloropropene were used.
- Dichloropropene[cis-1,3-] – There is no NMSSL or RSL. The NMSSLs for 1,3-dichloropropene were used.
- Dichloropropene[trans-1,3-] – There is no NMSSL or RSL. The NMSSLs for 1,3-dichloropropene were used.
- Dimethyl phthalate– There is no NMSSL or RSL. The NMSSLs for diethyl phthalate were used.
- Dinitrobenzene[1,3-] – There are no NMSSLs. The RSLs are used as surrogates.
- Di-n-octylphthalate – There are no NMSSLs. The RSLs are used as surrogates.
- Diphenylamine – There are no NMSSLs. The RSLs are used as surrogates.
- Hexanone[2] – There are no NMSSLs. The RSLs are used as surrogates.
- Iodomethane – There is no NMSSL or RSL. The RSL for bromomethane is used as a surrogate.
- 4-Isopropyltoluene – There is no NMSSL. The NMSSL values for isopropylbenzene were used as a surrogate.
- Methylphenols – There are no NMSSLs for these compounds. The RSLs were applied for 2- and 4- methylphenol. The RSLs for 3-methylphenol were used for 3,4-methylphenol.
- Nitroanilines – There are no NMSSLs for these compounds. The RSLs were applied for 2- and 4-nitroaniline. The RSL for 4-nitroaniline was applied to 3-nitroaniline.

- Nitrophenols – There are no NMSSLs or RSLs for these compounds. The RSLs for phenol were applied for 2- and 4-nitrophenol.
- Nitroso-di-n-propylamine[N-] – There are no NMSSLs. The RSLs were applied.
- PETN - There is no NMSSL for PETN. RSLs were used as a surrogate.
- Propylbenzene[1-] – There are no NMSSLs. The RSLs are used as surrogates.
- Pyridine– There are no NMSSLs. The RSLs are used as surrogates.
- 1,3,5-Trinitrobenzene – There is no NMSSL. RSLs for 1,3,5-trinitrobenzene were used as a surrogate.
- TATB – There is no NMSSL or RSL for TATB. RSLs for 1,3,5-trinitrobenzene were used as a surrogate because of structural similarity.
- Trimethylbenzenes – There are no NMSSLs. The RSLs are used as surrogates.
- Tris (o-cresyl) phosphate – There is no NMSSL or RSL. The RSL for tris(2-ethylhexyl)phosphate was applied as a similar structure without halogen substitutions.
- Xylenes, m,p - The NMSSL for total xylenes was applied.

2.1.4. Calculation of Hazard Index or Cumulative Cancer Risk

Noncancer HQs are calculated as follows using the NMSSL based on noncancer endpoints:

$$HQ = EPC/NMSSL$$

A Hazard Index (HI) was calculated by summing all of the HQs as follows:

$$HI = \sum HQ1, HQ2, \ldots$$

A CR was calculated as follows using the cancer-based NMSSL for each receptor and adjusting from a ratio to a cancer risk:

$$CR = \frac{EPC}{NMSSL} * 1 \times 10^{-5}$$

A Cumulative Cancer Risk (CCR) was calculated by summing the cancer risks for each detected analytes as follows:

$$CCR = \sum CR1, CR2, \ldots..$$

If the HI exceeded 1, or the CCR exceeded 1E-05, a refined EPC was calculated as described in Section 2.2. These refined EPCs were then compared to the NMSSLs.

2.2. SCREENING EVALUATION

For the initial screening evaluation step, for both organics and inorganics, the maximum detected value for each analyte was used as the EPC. This is conservative in that the EPC is compared to both the cancer and noncancer-based screening levels by dividing the maximum value by the screening level. The cancer based ratio is converted to a cancer risk by multiplying by 1E-05.

In addition, reporting limits for nondetected analytes were evaluated in order to avoid dropping contaminants from the analysis prematurely. Matrix interference can lead to elevated MDLs in individual samples, whereas for some analytes with high toxicity, detection limits below NMSSLs cannot be readily attained.

In the NMED (2022) screening process, if the HI and CCR are below targets of 1 and 1E-05, then the evaluation of human health risks concludes that there is no elevated noncancer hazard or cancer risk. If the maximum HI or CCR exceeded target levels of 1 or 1E-05, respectively, evaluation was continued with the UCL95 used as the refined EPC for the comparison. For this step in the screening process, only the higher of the two values in the duplicate pair was used in the statistical calculation.

A 95% upper confidence level (UCL95) was calculated for all contaminants of potential concern (COPCs) with the USEPA ProUCL 5.2 software (EPA 2022) if there were more than 8 samples for an analyte and more than 5 detected values. If there were too few detected concentrations reported to allow calculation of a UCL95 (i.e., number of detections <5), the median of all the detected data for the analyte was used. This is consistent with NMED (2022) and EPA (2022) guidance that states that UCLs should not be calculated when the number of detections is low, and a more robust statistic, such as the median, should be applied. If there was only one detection, this single maximum detected value was used.

Guidance from NMED (2022) was used to evaluate dioxin/furan concentrations. This guidance relies on the 2005 World Health Organization (WHO) toxicity equivalency factors (TEF) (Van den berg et al. 2006) approach. The TEFs are multiplied by the measured concentration to obtain a congener-specific product called the toxicity equivalent concentration (TECi), and the product for each TECi is summed for each sample location. This sum is referred to as the toxicity equivalent quotient (TEQ). The TEQ is divided by the NMED screening level for 2,3,7,8-Tetrachlorodibenzo-p-dioxin (TCDD) to obtain a risk ratio.

The toxicity of the various constituents analyzed in this investigation is incorporated into the screening levels. Screening levels are the abiotic media concentration at which toxic effects are not expected (i.e., a noncancer hazard quotient would equal 1, or a cancer risk would equal 1×10^{-5}), for a stated exposure scenario with default exposure parameters as defined by NMED (2022). Thus, when the concentration at the Unit is less than the screening levels, it is less than expected toxic levels.

The following sections present the human health risk-screening assessment for the Unit. The maximum EPC for each detected analyte was compared with the industrial worker, construction worker, and hypothetical future resident soil NMSSLs. The NMSSLs used in the evaluations were obtained from current NMED guidance (NMED 2022). The NMSSLs for carcinogens are equivalent to a 1×10^{-5} cancer risk, and for noncarcinogens the NMSSLs correlate to a HQ of 1. The HI was calculated by summing the HQs (NMED 2022), and the CCR was calculated by summing the CRs. Detected organic analytes were considered COPCs. Any detected inorganic analyte that exceeded background was also considered a COPC.

2.2.1. Data Analysis

Tables 2-2 and 2-3 present summary statistics for surface and subsurface samples, respectively. Maximum concentrations in the soil samples analyzed for inorganics were compared to the established soil BVs (LANL 1998) (Tables 2-2 and 2-3). The exposure interval for industrial workers is 0 to 1 foot bgs, and 0 to 10 feet bgs for hypothetical future residents and construction workers. The surface soils (Table 2-2) contain all of the data within the 0 to 1 foot interval, and the subsurface soil (Table 2-3)

contain all of the data from 0 to 10'. The subsurface data are depth limited because the deepest samples were 15 inches (1.25 feet).

2.2.2. Comparison to Background

The maximum detected result was used as the initial EPC and compared to background (Table 2-4). Background values for the site are from the 1998 background report (LANL 1998), and soil screening levels are the NMSSLs (Table 2-1). There were no BVs for perchlorate or nitrate. The maximum concentration for the following inorganics in surface and subsurface soil exceeded BVs, and they were then statistically evaluated by two-sample hypothesis tests. If the Wilcoxon-Mann-Whitney (or Gehan if ProUCL identified multiple detection limits or that the Wilcoxon-Mann-Whitney test was inappropriate) two sample hypothesis test indicated the site exceeded background, they were carried forward, and if the hypothesis test indicated that the Unit was not statistically different from background, they were not evaluated further. In addition, perchlorate, and nitrate and nitrate as nitrogen were retained because BVs were not available. There are no soil background data for silver, and therefore the upper and lower tuff background data were used in lieu of soil horizon data.

The following results apply to both surface and subsurface soils

- Barium – BV was exceeded; statistical testing showed Site>Background, therefore barium is retained for further evaluation.
- Cadmium – BV was exceeded. Statistical testing showed Site$\leq$ Background for both surface and subsurface soils. Therefore cadmium was rejected from further evaluation in both depth intervals..
- Copper – BV was exceeded. Statistical testing showed Site$\leq$Background for surface and subsurface soils, therefore reject from further evaluation. Selenium – BV was exceeded; statistical testing showed Site>Background, therefore retain for further evaluation for surface and subsurface soil.
- Selenium – BV was exceeded; statistical testing showed Site>Background, therefore retain for further evaluation.
- Silver – BV was exceeded. Statistical testing showed Site>Background for surface and subsurface soils, therefore retain for further evaluation.
- Zinc – BV was exceeded; statistical testing showed Site>Background, therefore retain for further evaluation.

The maximum concentration of all other inorganics was below BVs and they are not considered further.

2.2.3. Maximum EPC for Inorganics

The EPC used to calculate maximum cancer risk or noncancer risk for inorganics included the detected result and applied the MDL values for nondetected analytes in each sample. No inorganics exceeded NMSSLs in surface or subsurface soils. No MDLs exceeded maximum detected values for inorganics. For inorganic analytes, no reporting limits exceeded NMSSLs.

2.2.4. Maximum EPC for Organics

Calculation of the EPC used to obtain maximum cancer risk or noncancer hazard for organics conservatively included the detected result and applied the MDL value for nondetected analytes in each sample. Therefore, the maximum cancer risk or maximum noncancer HQ reported in Table 2-5 is the higher of the risk or hazard obtained by use of the maximum detected value or the maximum MDL. This

means that for those organics for which the maximum MDL exceeded the maximum detected value (i.e., shaded values in Table 2-2 and 2-3), risk or hazard will not be underestimated at this point in the analysis.

A few organics were detected in surface soil samples (Table 2-2) and subsurface soils (Table 2-3). These include energetics or explosives (e.g., HMX, RDX, TNT, and TATB) and TNT degradation products (e.g., 2,4-diamino-6-nitrotoluene and 2,6-diamino-4-nitrotoluene). SVOCs including acenaphthene, anthracene, and bis(2-ethylhexyl)phthalate were also detected (Tables 2-2 and 2-3), as was total petroleum hydrocarbon diesel range organics (TPH DRO).

2.2.5. Results Based on Maximum Exposure Point Concentrations

No detected organics exceeded the NMSSLs for residents or for industrial workers. No NMSSLs for construction workers were exceeded. The maximum TEQ for dioxin/furans was obtained by calculating a TEQ for each sample. The maximum TEQ was used to calculate the cancer risk and noncancer hazard. The maximum TEQ was greater than the target cancer risk levels of 1E-05 and the target HQ of 1 for residents (Table 2-5). The maximum TEQ did not exceed NMSSLs for industrial or construction workers.

The CCR based on the maximum detected value for the subsurface soil (0 to 10 foot soil depth) for residents was 5E-05, which is higher than the target level of 1E-05 (Table 2-5). The major risk contributor to residential risk was the maximum TCDD TEQ for dioxin/furans which was greater than the cancer-based NMSSL for residential use. The CCR based on the maximum detected value for industrial workers was 1E-05 for surface soil. The CCR of 1E-06 was below the target value of 1E-05 for construction workers for subsurface soil.

The HI based on the maximum EPC for residents was 5 for subsurface soil (Table 2-5). The HI based on the maximum EPC for the construction worker was 2. Industrial worker HI estimates were 0.4, or less than 1 for surface soil. The major risk contributor to noncancer hazard was the maximum TCDD TEQ for dioxin/furans which was greater than the noncancer-based NMSSL for residential or construction worker use. These results indicate that refining the EPCs is the appropriate next step.

The evaluation of the dioxin/furans is summarized in Tables 2-6 through 2-7. The TEFs for human health are reported in Table 2-6. The measured concentration or the MDL is shown for each congener in each sample (Table 2-7). The detection status is indicated by a zero for nondetects, and a 1 for a detected value. The MDL is used as a proxy for the sample concentration in the event the congener was not detected. The congener-specific TEFs are multiplied by the congener concentration which produces the TECi for each congener. Summing the TECi yields the TEQ for each sample (Table 2-7). Dividing the TEQ for each sample by the NMSSL for 2,3,7,8 TCDD, shown in Table 2-1, produces a CR or noncancer HQ. The maximum TEQ is the highest TEQ of any of the dioxin/furan samples. The maximum TEQ for dioxin/furans exceeded risk-based screening-levels for residents (Table 2-5).

2.2.6. Results Based on Refined Exposure Point Concentrations

The initial risk analysis was based on comparison of the maximum detected value as the EPC. The refined EPCs based on the UCL95 are shown in Table 2-8. Appendix A presents the ProUCL output. A UCL was only calculated if there were 5 or more detected values, and a total sample size above 8 (NMED 2022). The higher of the duplicate pair SFB-23-295637 and SFB-23-295638 was retained, and the lower value dropped, which decreases sample size for each analyte measured in the duplicate pair by 1. The detected values were used for detected samples, and MDLs were used for nondetected values in calculation of the UCL95s.

Per information provided in the ProUCL Technical Guide (EPA 2013), when the data were identified as having a lognormal distribution, and ProUCL recommended an H-statistic, the standard deviation in log scale was used to choose between the 95% Bootstrap t UCL or the BCA Bootstrap UCL. The bootstrap t UCL is bias corrected and applicable to moderately to highly skewed data sets. If the data are only slightly or mildly skewed, the BCA Bootstrap would be preferred. Skewness was defined by information in Table 2-1 in the ProUCL Technical Guide as mild when the standard deviation of the logged data was less than 1, and highly skewed if over 1. Refined EPCs are reported in Table 2-8.

The CCR based on the refined EPC in subsurface soil and the NMSSL for residential use is 6E-06, and the HI is 0.6 (Table 2-9). The CCR for the construction workers for exposure to subsurface soil is 1E-07, and the HI is 0.4. The CCR for industrial worker receptors for exposure to surface soil is 9E-07. The HI is 0.04, which is below the target of 1.

The refined EPC for the TCDD TEQ for dioxin/furans does not exceed the human health cancer or noncancer NMSSLs for any receptor for surface or subsurface soils (Table 2-9).

2.2.7. Lead

Lead is evaluated separately from other inorganics. The maximum lead concentration was below the BV for both surface and subsurface soil. Lead is not a COPC at the Unit.

2.2.8. Nondetected Analytes

For organic analytes that were never detected, only one analyte had MDLs in excess of risk-based NMSSLs (Table 2-10). This was N-nitrosodimethylamine, for which the MDLs were consistently higher than the residential cancer NMSSL. Current commercial laboratory methodology cannot attain the toxicity-based reporting limits.

2.2.9. Migration to Groundwater

The maximum detected value or the maximum MDL (Tables 2-2 and 2-3), whichever was higher, of each analyte was used as the EPC and divided by the Migration to Groundwater NMSSLs for a dilution attenuation factor (DAF) of 20 (Table 2-1). Maximum concentrations of amino-2,6-dinitrotoluene[4-], amino-4,6-dinitrotoluene[2-], and RDX in surface soil, and barium, amino-2,6-dinitrotoluene[4-], amino-4,6-dinitrotoluene[2-], and RDX in subsurface soil produced HQs greater than 1 for migration to groundwater NMSSLs (Table 2-5).

The refined EPC based on UCL95 concentrations of amino-2,6-dinitrotoluene[4-], amino-4,6-dinitrotoluene[2-], and RDX also exceeded the migration to groundwater NMSSL based on a DAF of 20 (Table 2-9). The highest ratio was 100 for RDX in subsurface soil. The degradation products were slightly higher in subsurface soil than surface soil. There are so few detections of these two analytes that statistics are likely biased high. The NMSSLs for groundwater protection are risk based, and there are no drinking water standards for these explosives.

LANL has established a groundwater monitoring network to assess the quality of groundwater in the Los Alamos area. The monitoring network includes monitoring wells, water-supply wells, surface-water sampling stations, and springs located both inside and outside the LANL boundary. Three groundwater zones (alluvial, perched-intermediate, and regional groundwater) are monitored as part of the monitoring network. Sample locations, analytical suites, and sampling schedules for the monitoring network are identified in the LANL Interim Facility-Wide Groundwater Monitoring Plan (LANL 2020b) that is updated annually.

A hydrologic conceptual model for TA-16, including the area of the TA-16 Burn Ground, is presented in the TA-16 Well Network Evaluation and Recommendations (LANL 2012b). That document ranks different sources at TA-16 by their potential to impact groundwater. High- and moderate-ranking sources were characterized by significant hydrologic drivers, i.e., either large outfall volumes released to canyons or ponds located on mesa tops. Sources were also characterized in terms of the release of large inventories or high contaminant concentrations. Both of these conditions are necessary to consider an area to have a high or moderate impact to groundwater. The TA-16 Burn Ground area was ranked as a low-priority source for its potential to impact groundwater, because it lacks both a large contaminant inventory and a large volume of water to provide a hydrologic driving force for contaminant infiltration.

Water supply well PM-5, the nearest water-supply well to the TA-16 Burning Ground, is located approximately 16,000 ft. (3 miles) to the northeast. Water-supply well PM-4 is located approximately 19,000 ft. (3.6 miles) east of the TA-16 Burning Ground, and PM-2 is located approximately 21,000 ft. (4 miles) southeast of the unit. Upper levels of the regional aquifer on the Pajarito Plateau are predominantly under phreatic (unconfined) conditions (LANL 2011). The regional water table is approximately 1,200 ft. below the TA-16 Burn Ground.

Potential risk associated with the abovementioned contaminants was mitigated through soil removal, which greatly reduced the potential for the contaminants to migrate to the subsurface. Additionally, clean fill placed over the excavated area further reduces the potential for contaminants to migrate. The low rates of precipitation in the area coupled with high evapotranspiration rates provide additional lines of reason that these constituents will not reach groundwater.

2.3. UNCERTAINTY ANALYSIS

The human health risk assessment has inherent uncertainties associated with data and data evaluation, exposure assessment, and the toxicity values on which the SLs are based. Each or all of these uncertainties may affect the assessment results, biasing the risk assessment results high or low.

2.3.1. Reporting Limits in Excess of NMSSLs

The concern when reporting limits are higher than NMSSLs is that the analyte is potentially present below detection levels at concentrations that could produce risk. To conservatively assess risk and verify that elevated reporting limits were considered, the maximum screening step utilized the higher of the maximum detected value or the maximum MDL. Reporting limits were compiled into development of refined EPCs as well.

In general, project reporting limits were satisfactory. Only one nondetected analyte had reporting limits in excess of NMSSLs for residents or worker receptors (Table 2-10). This is N-nitrosodimethylamine, for which reporting limits were consistently higher than the residential cancer NMSSL. Although records from 1951 to 1980 are not available for the Unit, physicochemical data indicate that this analyte would not remain in the environment even if it existed at one time. ATSDR (1989) states that this compound will not persist as it evaporates from soil, degrades on exposure to sunlight, or migrates into the subsurface, where it should break down within several months in subsurface soils. Degradation of NDMA at 21°C had a half-life of 4.1 days for ground cover soil, 5.6 days for turfgrass soil, and 22.5 days for tree soil (Yang et al. 2005). These short half-lives indicate that under environmental conditions this analyte would not be expected to occur in the 40 years following absence of records (i.e., 146,000 days).

2.3.2. Exposure Assessment

The exposure assessment assumptions bias the risk results high (i.e., overestimate risk). Assumptions for the industrial SLs are that the potentially exposed individual is a Laboratory worker who is outside at the site for 8 h/d for 225 d/yr (NMED 2022), and who spends the entire 8 h on-site within the contaminated area. Assumptions for the residential SLs are that the potentially exposed individual is a resident who is present 24 h/d for 350 d/yr (NMED 2022) and spends the entire 24 h on-site within the contaminated area. Construction workers are considered to be short-term workers but exposed at high rates. Because it is unlikely the worker or resident would be within the small (i.e., 0.26 acre) contaminated area for any significant duration, the screening assessments overestimate the exposure.

Assumptions underlying the exposure parameters, routes of exposure, and intake rates for routes of exposure are consistent with NMED parameters and default values (NMED 2022). In the absence of site-specific data, several upper-bound values for the assumptions may be combined to estimate exposure for any one pathway, and the resulting risk estimate derived from combining upper-bound exposure parameters can exceed the 99th percentile of a true risk estimate. Therefore, uncertainties in the assumptions underlying the exposure pathways may contribute to risk assessments that overestimate the reasonably expected risk levels.

2.3.1. Data and Data Analysis

Uncertainties in the data or its analysis may include errors in sampling, laboratory analysis, and data analysis. Data evaluation uncertainties are expected to have little effect on the assessment results because the data have undergone validation to minimize errors, and any errors are not expected to bias the results high or low. The J-flagged (estimated) qualification of detected concentrations of some organic COPCs does not affect the assessment by biasing results high or low, but can introduce some additional uncertainty in the result.

The use of the maximum and UCL95 as the EPC for each COPC is expected to bias risk estimates high, erring towards being conservative. Use of the maximum as the EPC overestimates exposure, as all other concentrations are below this value. Use of the UCL95 also results in an overestimation of risk since mean values are nearly always less than this value for typical contaminant distributions.

2.3.2. Toxicity Values

An additional uncertainty associated with the screening values is related to the derivation of toxicity values used in their calculation. Toxicity values (slope factors [SFs] and reference doses [RfDs]) were used to derive the risk-based screening values used in the screening evaluation (NMED 2022). Uncertainties are recognized to occur in four areas with respect to the toxicity values: (1) extrapolation from animals to humans, (2) variability between individuals in the human population, (3) the derivation of RfDs and SFs, and (4) the chemical form of the COPC.

The SFs and RfDs are often determined by extrapolation from animal data to humans, which may result in uncertainties in toxicity values because differences exist between animals and humans in chemical absorption, metabolism, excretion, and toxic responses. Differences in body weight, surface area, and pharmacokinetic relationships between animals and humans are taken into account to address these uncertainties in the dose-response relationship. However, conservatism is usually incorporated in each of these steps, potentially biasing the estimate high and resulting in the overestimation of potential risk.

For noncarcinogenic effects, the degree of variability in human physical characteristics is important both in determining the risks that can be expected at low exposures and in defining the no observed adverse effect level (NOAEL). The NOAEL uncertainty factor approach incorporates a 10-fold factor to reflect

individual variability within the human population that can contribute to uncertainty in the risk assessment. This factor of 10 is generally considered to result in a conservative estimate of risk for noncarcinogenic COPCs.

The RfDs and SFs for different chemicals are derived from experiments conducted by different laboratories that may have different accuracy and precision that could lead to an over- or underestimation of risk. The uncertainty associated with the toxicity factors for noncarcinogens is measured by the uncertainty factor, the modifying factor, and the confidence level. For carcinogens, the weight of evidence (WOE) classification indicates the likelihood that a contaminant is a human carcinogen. EPA's WOE classification is not based on the level of risk a substance might present, but how good the evidence is regarding carcinogenicity to humans. This WOE helps interpret uncertainty in the results.

COPCs may be bound to the environmental matrix and not available for absorption into the human body following ingestion. However, the exposure scenarios typically default to the assumption that the COPCs are bioavailable. This assumption can lead to an overestimation of the total exposure and overestimate risk.

For some analytes surrogate values were used due to a lack of NMSSLs. Where possible, the USEPA RSLs (EPA 2023) were applied. It is not expected that use of surrogates will bias the results high or low. Primarily, surrogates were needed for nondetected analytes in order to verify MDLs were adequate.

2.3.3. Additive Approach

For noncarcinogens, the effects of exposure to multiple chemicals are generally unknown and possible interactions could be synergistic or antagonistic, resulting in either an overestimation or underestimation of the potential risk by assuming additivity. Additionally, RfDs used in the risk calculations typically are not based on the same endpoints with respect to severity, effects, or target organs. Therefore, the potential for noncarcinogenic effects may be overestimated by the HI considering individual COPCs act by different mechanisms and on different target organs but are addressed additively. Cancer risks are typically assumed to be additive.

2.4. CONCLUSIONS

Inorganics were compared to BVs and risk-based NMSSLs. Six inorganics exceeded BVs, and four of those exceeded background based on hypothesis testing. Nitrate (as nitrate or nitrate-nitrogen) and perchlorate had no BVs and were evaluated for potential health risk. No inorganics exceeded human health risk-based SLs. Soil samples were grouped by depth into surface (0 to 1 foot) and subsurface (0 to 10 foot) depth categories for evaluation. Lead is considered separately from other analytes, and lead was less than background and so was not evaluated for risk.

There were several organics detected, including some energetics and breakdown products, some SVOCs, and TPH DRO. Maximum concentrations of detected analytes in surface soil were below industrial worker NMSSLs. Maximum concentrations of the detected analytes in subsurface soils were below risk-based residential SLs for all constituents except the dioxin/furan TCDD TEQ. Maximum concentrations were below construction worker NMSSLs in subsurface soils.

When refined EPCs were considered, no constituents were above target levels for cancer risk or noncancer hazard for any receptor. The CCR based on refined EPCs for surface soils for industrial workers was 9E-07, and the HI was 0.04. The CCR based on refined EPCs for subsurface soils was 6E-06, and the HI was 0.6, for residents. The CCR and HI were below target levels for construction workers at 1E-07 and 0.4, respectively.

Migration to groundwater NMSSLs were exceeded by amino-2,6-dinitrotoluene[4-], amino-4,6-dinitrotoluene[2-], and RDX refined EPCs in both surface and subsurface soils. A hydrologic conceptual model for TA-16, including the area of the TA-16 Burn Ground, is presented in the TA-16 Well Network Evaluation and Recommendations (LANL 2012b). That document ranks different sources at TA-16 by their potential to impact groundwater. High- and moderate-ranking sources were characterized by significant hydrologic drivers, i.e., either large outfall volumes released to canyons or ponds located on mesa tops. Sources were also characterized in terms of the release of large inventories or high contaminant concentrations. Both of these conditions are necessary to consider an area to have a high or moderate impact to groundwater. The TA-16 Burn Ground area was ranked as a low-priority source for its potential to impact groundwater, because it lacks both a large contaminant inventory and a large volume of water to provide a hydrologic driving force for contaminant infiltration.

Note that land use in the foreseeable future is not residential. Groundwater at the facility is monitored in accordance with the LANL Interim Facility-Wide Groundwater Monitoring Plan and the TA-16 Burn Ground site is ranked as a low-priority source for its potential to impact groundwater. Additional clean-up (e.g., soil removal) at the Unit is not recommended.

Further evaluation of this Unit on the basis of human health risk assessment is not warranted.

3. ECOLOGICAL SCREENING ASSESSMENT

3.1. INTRODUCTION

The ecological risk-screening assessments for the Unit is presented in the following sections. The ecological risk-screening evaluation identifies chemicals of potential ecological concern (COPECs) and is based on the comparison of EPCs with ecological screening levels (ESLs) in accordance with Laboratory (LANL 2018) and NMED (2018) guidance. Data for both surface and subsurface soil depths were combined for the ecological risk-screening assessment, because all data fall within a 0 to 1.25 foot interval. Although NMED guidance (2018) recommends two soil horizons be evaluated, the samples collected all represent the interval for non-burrowing receptor and shallow rooted plants (0 to 1.25 foot interval). There is not a deeper soil interval at the Unit to be evaluated because the subsurface samples were collected from as close to the tuff-soil surface as possible.

The ESLs obtained from the ECORISK Database, Version 4.3 (LANL 2022), updated September 19, 2022, are presented in Table 3-1. The ESLs are based on toxicity data for Laboratory species similar to those expected to occur at the site, and are derived from experimentally determined no observed adverse effect levels (NOAELs), lowest observed adverse effect levels (LOAELs), or doses determined to be lethal to 50% of the test population (LD50). Information relevant to the calculation of ESLs, including concentration equations, dose equations, bioconcentration factors, transfer factors, and toxicity reference values, are presented in the ECORISK Database, Versions 2.0, 3.1, 4.1, and 4.2 (LANL 2003; LANL 2012a; LANL 2017, LANL 2020a).

The initial screening evaluation is conducted by dividing the maximum EPCs by the no adverse effect level ESLs (NE ESLs) to obtain a HQ calculated for each COPEC and screening receptor. As a generalization, the higher the contaminant levels relative to the ESLs, the higher the potential risk to receptors; conversely, the higher the ESLs relative to the contaminant levels, the lower the potential risk to receptors. HQs greater than 0.1 in the initial screening level evaluation are used to identify COPECs requiring additional evaluation (DOE NMED 2017).

Individual HQs for a receptor are summed to derive a HI. An HI greater than 1 indicates that further assessment may be needed to ensure exposure to multiple COPECs at a site will not lead to potential adverse impacts to a given receptor population. The HQ and HI analysis is a conservative indication of potential adverse effects and is designed to minimize the potential of overlooking possible COPECs at the site. UCL95 values are used to refine the EPCs, which are then compared to the ESL based on the lower observed adverse effect level (LE ESL). The analysis is then concluded with evaluation using area use factors (AUF).

3.2. PROBLEM FORMULATION

The Unit is a terrestrial ecosystem. The area within the fence is disturbed with little to no vegetation present adjacent to the burn tray. Vegetation increases with distance from the burn tray and consists of grasses and shrubs. The site slopes slightly to the south - southwest. There are likely terrestrial birds and small mammals including deer mice and ground squirrels using the area. Elk tracks and scat were observed during a site visit March 2019; however, there is not enough vegetation within the fenced area to support large herbivores. They prefer the ponderosa pine forest around the unit.

Due to the site history, there is the potential for energetic compounds or their breakdown products to be present in surface soils. Terrestrial animals and plants may contact surface soils and be exposed. The total area where all of the samples collected is approximately 2 acres, which is equivalent to 0.8094 ha. The area within the SWMU boundary is 0.64 ac (0.26 ha). The larger 0.8094 ha was used to evaluate potential ecological risks.

Soil is the only potential abiotic exposure medium at the Unit. Soil ingestion is the primary exposure route (Figure 3-1). Dietary ingestion by higher trophic level animals of plants and animals exposed to soil may also occur.

Due to lack of its preferred riparian habitat and lack of dense cover, the montane shrew is not expected to occur in the Unit. It is retained only because it may be representative of other mammalian insectivores. Other receptors that are expected to occur based on available habitat are shown in the conceptual site model (Figure 3-1).

3.3. SCREENING EVALUATION

Ecological risk for soils is evaluated by NMED for soils in the 0 to 6 foot depth interval. This corresponds to the subsurface soils evaluated for human health risk since all existing data were collected from less than 6 feet deep. The summary statistics for the subsurface soil sample data collected from 0 to 1.25 feet deep were presented in Table 2-3. The NE ESLs are presented for each receptor in Table 3-1. Maximum detected concentrations of each analyte are used as the initial EPC, and are divided by the NE ESL to derive a HQ for each detected analyte and inorganic statistically greater than background. The EPCs and the screening results are presented in Table 3-2.

Any analytes for which the measured maximum detected value exceeded the ESLs with an HQ of 0.1 or more were considered COPECs and evaluated further by calculating refined EPCs based on UCL95s. ESLs are lacking for many of the organics on the target analyte list.

Surrogates were proposed for the detected organics and inorganics above background or without BVs for which no ESLs were available. There remain analytes for which ESLs are lacking for birds, and sometimes invertebrates or plants. In general, ESLs were available for mammals. The analytes lacking any ESLs and the applied surrogates are as follows:

- Nitrate – No values in LANL database. Addressed in Uncertainty Analysis
- Perfluoropentanoic acid – addressed in uncertainty analysis.
- TATB - Use 1,3,5-Trinitrobenzene ESLs
- Isopropyltoluene[4-] - Use toluene ESLs

3.3.1. Inorganics

There are six inorganic analytes in the subsurface soil dataset that exceed site BVs, four of which are statistically significantly elevated above background (barium, selenium, silver, and zinc). Because there was no soil silver background data, the upper and lower tuff background dataset was applied to evaluate silver. Cadmium and copper were not statistically elevated above background. In additionthree inorganics are carried forward for which BVs were not available. These are nitrate, nitrate as nitrogen, and perchlorate. The inorganics that carry forward for further evaluation are as follows:

- Barium – greater than BV; greater than soil background by hypothesis testing
- Cadmium – greater than BV; less than or equal to soil background by hypothesis testing
- Copper – greater than BV; less than soil background by hypothesis testing.
- Nitrate; Nitrate as Nitrogen (No BV), retain for evaluation
- Perchlorate (No BV), retain for evaluation
- Selenium – greater than BV; greater than soil background by hypothesis testing.
- Silver – greater than BV; greater than background for upper and lower tuff in hypothesis testing.
- Zinc – greater than BV; greater than soil background by hypothesis testing.

The inorganic analytes that were above background have maximum concentrations that also exceed ecological NE ESLs as follows (Table 3-2):

- Barium
- Selenium
- Silver
- Zinc

Perchlorate maximum concentrations were below all ESLs. There were no ESLs for the nitrates and they cannot be evaluated further.

If an inorganic analyte maximum exceeded the BV, and the ratio of the maximum concentration to the risk-based NE ESL was greater than 0.1, a refined EPC based on the UCL95 was calculated with the USEPA ProUCL 5.2.0 software (EPA 2022). This refined EPC based on the UCL95 (Table 2-8) was then compared to the LE ESLs found in Table 3-3. Table 3-4 presents the HQs and HIs based on refined EPCs and LE ESLs.

The UCL95 values for barium, selenium, and zinc exceeded one or more of the receptor-specific LE ESLs to result in an HQ greater than 0.1 (Table 3-4). HQs for the American kestrel modeled as a top carnivore and the gray fox also modeled as a carnivore were consistently less than or equal to 0.1 for inorganics. HQs based on the refined EPC and LE ESLs for robin in different feeding guilds, deer mouse, earthworms, and plants exceeded 0.1 for barium. HQs for most mammalian and avian receptors and plants exceeded 0.1 for selenium, and HQs for robin modeled as insectivore and omnivore exceeded 0.1 for zinc. This suggests some limited potential for adverse ecological effects at the Unit due to exposure to

inorganics above background, however additional lines of evidence are considered in the following sections.

3.3.2. Dioxin and Furans

Dioxins and furans are evaluated in a multi-step process that takes the concentration of each congener and multiplies it by a TEF (Table 3-5) for mammals or birds. The resulting TECi values are summed to obtain a TEQ (Table 3-6 and Table 3-7). The maximum 2,3,7,8-tetrachlorodibenzodioxin (TCDD) TEQ for mammals is compared to the NE ESLs (Table 3-8) by dividing the TCDD TEQ by the NE ESL to obtain an HQ. There is no NE ESL for avian species and potential toxicity cannot be quantified further. The HQ values were above an initial screening HQ of 0.1. TEFs were not available for invertebrates or plants, and it is assumed that mammalian TEQs are protective of exposure to invertebrates, and the TEQ was divided by the NE ESL for earthworms to obtain an HQ for invertebrates. It is assumed that mammalian HQs are reflective of potential toxicity to birds and plants. The most recent LANL database does not report ESLs for any avian species or plants. TEQs for birds are provided as a qualitative comparison to mammalian TEQs. The maximum TEQ for avian species (1.87E-04) is less than the maximum mammalian TEQ (2.17E-04), suggesting potential toxicity to birds is not higher than mammals.

A UCL95 TEQ based on the sample-specific TEQs was calculated for mammals with ProUCL (EPA 2022). When the UCL95 TEQ was divided by the receptor-specific LE ESLs for TCDD for mammals, the resulting ratios or HQs exceeded 0.1 only for deer mouse and montane shrew (Table 3-4). This analysis suggests that there may be toxicity to ecological receptors due to exposure to dioxins/furans. The dioxin/furans are further evaluated in the uncertainty analysis.

3.3.3. Other Organics

Maximum concentrations of nine other organics produced HQs greater than 0.1. These wereacenaphthene, benzoic acid, bis(2-ethylhexyl)phthalate, di-n-butylphthalate, HMX, RDX, TATB, TPH DRO, and 2,4,6-TNT.

UCL95 values (Table 2-8), were calculated for organics and compared to the LE ESLs (Table 3-4). The SVOCs were infrequently detected with only one or two detected values. The maximum was used as the EPC for analytes with one detected value, whereas a median of the detected concentrations was calculated and used as the estimate of the refined EPC if there were two to four detected values (Table 2-8). This approach is consistent with ProUCL guidance (EPA 2022) which recommends use of alternative statistics when detection frequency is low. The highest value of the duplicate pair was retained for calculating UCL95s.

HQs for bis(2-ethylhexyl)phthalate and RDX, based on refined EPC values and the LE ESLs, were above 0.1 for one or more receptor groups (Table 3-4). The remaining HQs were less than or equal to 0.1.

3.3.4. Hazard Indices

The HIs based on refined EPCs and LE ESLs for summation of inorganic, dioxin/furan, and other organic HQs for all receptors except the American kestrel as a top carnivore and gray fox exceeded 1 (Table 3-4). This analysis suggests that there may be toxicity to ecological receptors due to exposure to within the Unit. The COPECs with HQs greater than 0.1 are further evaluated in the uncertainty analysis.

3.4. UNCERTAINTY ANALYSIS

3.4.1. Chemical Form

Inorganic analytes can speciate into different forms with varying degrees of toxicity. The assumptions used in the ESL derivations are conservative and not necessarily representative of actual conditions. These assumptions include maximum chemical bioavailability, maximum receptor ingestion rates, minimum bodyweight, and additive effects of multiple COPECs. These factors tend to result in conservative ESL estimates, which may lead to an overestimation of the potential risk. Toxicological data are typically based on the most toxic and bioavailable chemical species, which may or may not be found in the environment. The ESLs were calculated to ensure a conservative indication of potential risk (LANL 2018), and the values are biased toward overestimating the potential risk to receptors.

The chemical form of the individual COPECs was not determined as part of the investigation. COPECs are generally not 100% bioavailable to receptors in the natural environment because of interference from other natural processes, such as the adsorption of chemical constituents to matrix surfaces (e.g., soil) or rapid oxidation or reduction changes that render harmful chemical forms unavailable to biotic processes.

3.4.2. Exposure

Exposure parameters including the EPC and the intakes likely bias risk estimates high because they presume no movement of receptors in and out of source areas. Sampling focused on areas of known or expected contamination, which biases the EPC high. Receptors are assumed to spend 100% of their time in the contaminated area which results in conservative estimates of exposure.

3.4.3. Mixture Toxicity

The assumption of additive effects for multiple COPECs may result in an over- or under-estimation of the potential risk to receptors. Exposure to multiple contaminants may result in other than additive effects.

3.4.4. Small-Mammal Field Investigations

Small mammal trapping and analysis of whole organisms were conducted in the area near the Unit in 2011 and 2012. This information was considered useful for the current analysis. Field mice and voles were collected around the open-burn site and analyzed for dioxins and furans as well as metals in 2011 and for polychlorinated biphenyls (PCBs), high explosives, and perchlorate in 2012. Small-mammal community and population parameters were also measured across the site in 2012 (Fresquez et al. 2013).

Barium, cadmium, and nickel were detected in two to three whole body samples, and lead was detected in one whole body sample, above the regional statistical reference levels (RSRLs), which are the upper bounds of concentrations (mean plus three standard deviations) calculated from field mice collected at regional locations over nine miles away from the influence of the Laboratory (Fresquez 2009 and 2011a). The cadmium, nickel, and lead concentrations were slightly above the RSRLs, while barium concentrations were three to four times the RSRL. No high explosives were detected in any of the animals collected, and perchlorate concentrations were one or two orders of magnitude below the RSRL.

Dioxin and furan congeners were not detected above the detection limit in any of the whole-body samples analyzed; eight congeners were detected in one deer mouse sample, one congener was detected in one long-tailed vole sample, and no congeners were detected in the other four small mammals (three voles and one deer mouse) (Fresquez et al. 2013). Concentrations in whole body samples were well below the concentrations detected in the soil, and biological samples had fewer congeners detected than in 40% of the soil samples, and concentrations were below the deer mouse ESL for TCDD in LANL (2012). The dioxin and furan data are similar to other dioxin/furan field-mouse uptake studies at LANL (Fresquez 2011b) and nationally (Krouskop et al. 1991).

The data indicate dioxins and furans at the concentrations found in soil under natural field conditions are not significantly assimilated, either by ingestion and/or by surface contact, by field mice/voles possibly because of the adsorption of the chemical to soil surfaces or because of oxidation/reduction changes. In addition, the samples analyzed included the pelt and carcass so it is not clear whether the congeners detected represent uptake or adherence of soil particles to the pelt. Also, no adverse effect of burning ground operations was found on local small mammal populations based on species richness, capture rate, species diversity, sex ratios and adult body weights (Fresquez et al. 2013).

The presence of dioxins and furans in soil does not determine exposure and risk to receptors. Dioxins and furans are relatively unavailable for uptake by plants and animals because these compounds are tightly bound to soil particles, are immobile, and insoluble (Umbreit et al. 1986). EPA reported that the relative bioavailability of polychlorinated dibenzo-p-dioxins and polychlorinated dibenzofuran congeners in soil is less than 100% as compared with a lipid or organic solvent vehicle as the reference material (EPA 2010a). Abiotic constituents, compound aging, and other associated soil factors may influence soil bioavailability (e.g., bioavailability appears to decrease with aging based on comparisons of laboratory spiked soil and soil contaminated in situ [Umbreit et al. 1986]). This relationship is supported by the lack of uptake and impacts to biota around the Laboratory and at the TA-16 Burn Ground where dioxin and furan congeners have been detected. The difference between the toxicity represented by the ESLs and the lack of adverse effects may be related to the low bioavailability of dioxins and furans in soil.

Small mammal populations in the area show no evidence of significant elevated exposure. There do not appear to be population-related impacts based on the above analysis.

3.4.5. Avian Field Investigations

A total of four avian egg samples were obtained in 2018 from TA-16 and analyzed for inorganic elements (Gaukler and Stanek 2019). Two samples consisted of one western bluebird (*Sialia mexicana*) egg each. There was one composite sample of four western bluebird eggs, and one composite sample of two ash-throated flycatcher (*Myiarchus cinerascens*) eggs.

Concentrations of inorganic elements were compared with the upper-level bounds of background concentrations in bird eggs. The data indicated aluminum, arsenic, beryllium, cadmium, lead, nickel, thallium or vanadium were not detected in eggs. One sample contained higher concentrations of antimony (0.21 mg/kg) compared with background (0.11 mg/kg). Two samples contained higher concentrations of mercury (0.23 and 0.25 mg/kg) compared to background (0.18 mg/kg). Soil concentrations of antimony and mercury are below soil BVs at the Unit. Of the inorganics above soil background, barium, selenium, silver, and zinc concentrations in eggs from TA-16 were similar to or below regional egg background levels (Gaukler and Stanek 2019).

Avian population metrics also do not suggest that birds in the vicinity of TA-16 399 are being negatively impacted (Hathcock et al 2018). Metrics including species richness and diversity were not statistically different from the Unit than at the control area. Abundance varied in the Unit and control area annually, but abundance in the Unit compared to controls were similar over time. Species composition indicates little difference between the Unit and control sites.

Combined, the egg concentration data and population metrics suggest that adverse health effects are not expected at the observed concentrations.

3.4.6. Detection Frequency and Areal Extent of Concentrations Greater than Screening Levels

The detection frequency and spatial pattern of the COPECs that have HQs above 0.1 based on the LE ESL is considered. Barium, selenium, and zinc are the inorganics for which the refined EPC based on a UCL95 exceeded the LE ESL. Bis(2-ethylhexyl)phthalate, RDX, and dioxin/furansare the only organics for which the refined EPC based on the UCL95 exceeds LE ESLs.

Barium was detected in all samples collected. The barium UCL95 is 14 times higher than background values of 295 mg/kg. Thirty-eight of 52 samples, not counting the minimum of the duplicate pair removed for statistical analysis, exceeded the BV. The minimum barium ESL is based on potential toxicity to plants; however, no toxicity to plants was noted in the field visit (i.e., chlorosis, dead plants). EPA (2005) indicates barium background concentrations in the Western US range from about 350 mg/kg to about 1100 mg/kg. Sources of toxicity information for plants suggest that it takes concentrations of barium in soils above 2000 mg/kg to cause toxicity (Chaudhry et al. 1977). Eight of 52 samples exceeded this potentially toxic level of 2000 mg/kg for plants, and 40 of 52 exceeded the LE ESL of 260 mg/kg for plants. This analysis suggests that there may be some limited toxicity to plant populations at the site due to barium. The refined barium EPC of 1363 mg/kg is less than the LANL Preliminary Remedial Goal (EcoPRG) for barium for plants of 1400 mg/kg.

Selenium was detected in 37 of 52 samples. Four of 52, not counting the minimum of the duplicate pair removed for statistical analysis, samples were above the BV of 1.52 mg/kg. The UCL95 of 0.883 mg/kg was less than the BV, suggesting that exposure across the Unit will not exceed inherent background. The refined EPC of 0.883 mg/kg is less than the minimum LANL EcoPRG for selenium of 15 mg/kg, which is based on earthworms.

Zinc was detected in all 42 samples. Of these, 14 of 42 samples, not counting the minimum of the duplicate pair removed for statistical analysis, exceeded background values of 48.8 mg/kg. The UCL95 of 62.98 mg/kg was 1.3 times higher than background, suggesting exposure across the Unit is approximately equal to inherent background. The refined EPC of 62.98 mg/kg is less than the minimum LANL EcoPRG for zinc of 810 mg/kg, which is based on earthworms.

Bis(2-ethylhexyl)phthalate was detected in 23 of 37 samples, not counting the minimum of the duplicate pair removed for statistical analysis. The American robin modeled as an insectivore was the most sensitive receptor for which the LE ESL was 0.2 mg/kg. Four samples (SFB-23-295631, SFB-23-295632, SFB-23-295634, and SFB-23-295637) exceeded the LE ESL for the robin modeled as an insectivore, but no samples produced HQs above 1 for other avian or the mammalian receptors based on the LE ESLs. This low frequency of exceeding the LE ESL indicates this compound is not likely to produce elevated exposure to any receptor. The refined EPC of 0.483 mg/kg is less than the minimum LANL EcoPRG for selenium of 8.7 mg/kg, which is based on the robin modeled as an insectivore.

RDX was detected in 17 of 42 samples, not counting the minimum of the duplicate pair removed for statistical analysis. The robin (herbivore) was the most sensitive ecological receptor with an LE ESL of 4.5 mg/kg. Ten out of 42 samples exceeded the LE ESL for the robin to produce HQs greater than 1. This relatively infrequent occurrence of soil concentrations above the LE ESL suggests some minimal potential for toxicity. The refined EPC of 7.46 mg/kg is less than the minimum LANL EcoPRG for selenium of 15 mg/kg, which is based on the earthworm.

One or more dioxin/furan congeners were detected in each of the 52 samples collected, not counting the minimum of the duplicate pair removed for statistical analysis. Thirty-nine of the 52 TEQs exceeded the lowest mammalian TCDD LE ESL, which is 1.90E-06 mg/kg for the montane shrew. The UCL95 TEQ of 1.88E-05 mg/kg compared to the receptor-specific LE ESLs produced HQs above 1 for deer mouse (HQ of 5) and montane shrew (HQ of 10). The TEQs are considered biased high since the MDL was used as a proxy for non-detected congeners, when in fact congener concentrations by definition are below this

level. Since at least one if not more congeners were not detected in each sample, this biases the TEQ high. The refined EPC of 1.88E-05 mg/kg is less than the minimum LANL EcoPRG of 3.2E-05 mg/kg for the montane shrew.

The results of evaluating the data against BVs and by considering spatially averaged refined EPCs were evaluated The inorganics barium, selenium, and zinc, and the organics bis(2-ethylhexyl)phthalate, dioxin/furans, and RDX, are frequently detected. None of these six COPECs exceeded their respective EcoPRGs.

3.4.7. Detected Analytes Without ESLs

Several chemicals do not have ESLs for any receptor in release 4.3 of the ECORISK Database (LANL 2022). In the absence of a chemical-specific ESL, concentrations were compared with the ESLs for a surrogate chemical if available. Comparison to surrogate ESLs provides an estimate of potential effects of a similar related compound and a line of evidence to indicate the likelihood that ecological receptors are potentially impacted. Surrogates increase uncertainty, but are not expected to bias the risk results low or high.

Some chemicals without ESLs do not have chemical-specific toxicity data or surrogate chemicals to be used in the screening assessments and cannot be assessed quantitatively for potential ecological risk. These are nitrate, nitrate as nitrogen, and perfluoropentanoic acid.

Chemicals lacking ESLs are often infrequently detected across the site. In these cases, comparisons with human health SSLs are presented as part of a qualitative assessment. The comparison of concentrations to human health SSLs is a viable alternative for several reasons. Animal studies are used to infer effects on humans and are the basic premise of modern toxicology (EPA 1989). In addition, toxicity values derived for the calculation of human health SLs are often based on potential effects that are more sensitive than the ones used to derive ESLs (e.g., cellular effects for humans versus survival or reproductive effects for terrestrial animals). EPA also applies uncertainty factors or modifying factors to ensure the toxicity values are protective (i.e., they are adjusted by uncertainty factors to values much lower than the study results). Concentrations compared with these values are frequently an order of magnitude or more below the SLs, which corresponds to uncertainty factors of 10 or more. Therefore, it is assumed the differences in toxicity would not be more than an order of magnitude for any given chemical. The relative difference between values provides a weight of evidence that the potential toxicity of the chemical is likely to be low or very low to the receptor(s).

The nitrates and nitrates as nitrogen did not produce any elevated human health risk to receptors evaluated for contact with subsurface soil, which are residents or construction workers. There are no human health toxicity values for perfluoropentanoic acid, but cancer risk and noncancer hazard were below threshold levels for predicted toxicity for all other perfluoro- and polyfluoroalkyl substances (PFAS) compounds evaluated in the human health risk assessment.

3.4.8. Data and Area Use Factors

The Unit is small. The area within the SWMU boundary is 0.64 ac (0.26 ha). The total area where all of the samples were collected is approximately 2 acres or 0.8094 ha, which is the value used in the ecological risk assessment.

The home range (HR) is used to calculate area use factors (AUFs) that are used in the EcoPRG equations (LANL 2018). Individual AUFs and population area use factors (PAUFs) may be used to modify the estimate of risk to wildlife receptors to allow estimates to be more site-specific. The application of AUFs

or PAUFs reduces potential overestimation of risks for those receptors with HRs larger than the area of contamination being evaluated. The estimated ecological risk as indicated by the HQ or HI is multiplied by the AUF or PAUF. HQs for plants or invertebrates are not adjusted by area use. The habitat is not suitable for Mexican Spotted Owls or other special status species, and so an AUF evaluation was not conducted.

Table 3-8 and 3-9 presents the area use hazard analysis based on NE ESLs and LE ESLs, respectively. The area used in the calculations was 2 ac.

The NE ESLs and the LE ESLs for each COPEC that exceeded background and was detected are shown in Tables 3-1 and 3-3, respectively. The site specific PAUFs are shown for the area where samples were collected (i.e., 2 ac). The UCL95 or refined EPCs (Table 2-8; Appendix A) are divided by the species-specific NE (Table 3-1) or LE ESLs (Table 3-3), and multiplied by the species-specific PAUF to obtain revised HQs (Tables 3-8 and 3-9). It is noted that this analysis does not impact the HQs for invertebrates or plants because they are considered to not move significantly within their environment, and therefore the PAUF for these receptors is 1.

Several COPECs produce NE ESL HQs above 0.1 for one or more receptors (Table 3-8). These are:

- barium for deer mouse, plants and earthworms;
- selenium for deer mouse, earthworm, and plants;
- zinc for earthworm and plants;
- bis(2-ethylhexyl)phthalate for robin modeled as omnivore and insectivore;
- RDX for robin modeled as herbivore and omnivore, and earthworm;
- TATB for earthworm;
- TCDD for deer mouse and shrew;
- TPH DRO for plants.

Several COPECs produce LE ESL HQs above 0.1 for one or more receptors. These are:

- barium for plants and earthworms;
- selenium for deer mouse and plants;
- RDX for earthworm;
- TCDD for deer mouse and shrew.

The HIs are above 1 for deer mouse (HI = 2), and plants (HI = 6). TCDD TEQ is the primary risk driver for deer mouse with an HQ of 1. Barium is the major risk driver for plants with an HQ of 5.

3.4.9. Comparison to Preliminary Remedial Goals

All COPECs producing LE ESL HQs adjusted to reflect area use (Section 3.4.8) are below LANL PRGs (Table 3-10). The refined EPC was compared to the preliminary remedial goals (PRGs). This comparison indicates:

- Barium – the lowest PRG is for plants and is 1400 mg/kg. The barium refined EPC is only slightly higher than this at 1363 mg/kg.
- Selenium – the lowest PRG is 15 mg/kg for plants. The refined EPC is 0.883 mg/kg.
- RDX – the lowest PRG is 15 mg/kg for earthworms. The RDX refined EPC is 7.46 mg/kg.

- TCDD – the lowest dioxin/furan PRG is 3.2E-05 mg/kg. The refined EPC for the TCDD TEQ is less than this at 1.88E-05 mg/kg. TCDD is less than the PRG.

3.5. CONCLUSIONS

Barium, selenium, and zinc were the inorganics for which the UCL95 exceeded both background and the LE ESL to produce HQs above 0.1. Further evaluation with the PAUFs indicated that barium exceeded the LE ESL for plants and earthworms, and selenium exceeded the LE ESL for deer mouse and plants. No visual effects were noted on the plant community within the Unit. No effects have been observed in birds or small mammals. Inorganics were less than the LANL PRGs.

The refined EPC based on the UCL95 for TCDD TEQ exceeded the LE ESLs to produce HQs above 0.1 for the deer mouse and montane shrew. Birds cannot be quantitatively addressed due to the absence of ESLs. It is assumed that the evaluation for mammals is protective of avian species. The TCDD TEQ refined EPC is less than the PRG and further remediation for TCDD is not recommended.

Bis(2-ethylhexyl)phthalate and RDX are the only other organics for which the refined EPC based on the UCL95 compared to the LE ESLs produced HQs above 0.1. Further evaluation with the PAUFs indicated that of these two organics, only RDX exceeded LE ESLs and this was for earthworms. The refined EPC for RDX was less than the PRG.

The small mammal tissue study indicated little uptake of dioxins/furans by small mammals at TA-16 as a whole, as well as little effect on mammal populations. For avian species, eggs analyzed for inorganics had antimony and mercury concentrations above egg background values, but mercury concentrations were below known toxic levels. Antimony and mercury are below background at the Unit. Population metrics for birds were not statistically significantly different from controls.

NMED guidance (2018) indicates that ecological risk assessments require inquiries into the relationship between an assessed endpoint and the expected response when exposed to site contamination. While comparison to literature published values show a potential for elevated risk to plant receptors potentially in the area, studies conducted in the area show no adverse population effects to small mammals or birds in the area. Additionally, when thinking of the near and foreseeable future use for the site, vegetation in the area will be kept to a minimum, as it is located in the general area of an operating Unit. There is not a likely species impact to representative receptors. Because biological data from the area indicate no adverse effects, and because HQs and HIs, while exceeding targets of 0.1 and 1, respectively, are relatively low, the Unit does not appear to present a significant ecological risk. Refined EPCs are less than PRGs. Additional effort at this Unit is not recommended.

Notes: Shaded cells in BV Ratio column indicate maximum exceeds background value
Analytes indicated with shading are carried forward to hypothesis testing
Analytes that exceed background (Site>BKG) or without any background data proceed forward in the risk assessment
There were no soil background data for silver; therefore, the upper and lower tuff data were used to perform hypothesis tests
BV – Background value NA – Not applicable
BKG – Background NV – No value
mg/kg – Milligram per kilogram WMW – Wilcoxon Mann Whitney

Cumulative Cancer Risk		**5E-05**		**1E-06**		
Hazard Index			**5E+00**		**2E+00**	

Notes:
Shaded cells indicate cancer risk or HQ exceeds target
CW – Construction worker
HQ – Noncancer hazard quotient
mg/kg – milligram per kilogram
- No value
TPH DRO – Total petroleum hydrocarbons diesel range organics
SL-SSL, DAF 20 – Migration to groundwater screening level at a dilution attenuation factor of 20

TEQ	**2.89E-06**		**1.22E-06**		**1.15E-06**		**1.90E-06**		**1.87E-06**	

Notes: The TECi are summed in each column to obtain the TEQ
The value for "Result" is the detected value or the MDL if not detected
Detect Code = 1 is detected, 0 is not detected
Shaded samples are subsurface samples (>1 foot deep)

Notes:
Sample size (n) and number of detects reflects removal of lowest of the duplicate pair (SFB-23-295637, SFB-23-295638)
Per NMED (2022), UCLs not calculated unless there were ≥5 detected values and 8 total samples
EPCs represent all detected analytes and for inorganics, all detected analytes with maxima greater than the BTV and identified as above background by hypothesis testing
Data include only the higher of the duplicate pairs.
KM – Kaplan- Meier
NDD – No discernable distribution
UCL – Upper Confidence Limit
"-" – no value

Notes: Table shows inorganics that are above BVs and statistically elevated above background and detected organics.
ESLs are in units of milligram per kilogram (mg/kg)
C - Carnivore
TC – Top carnivore
IC – Insectivore/carnivore
H – Herbivore
I – Insectivore
O – Omnivore

- Indicates no value is available

Table 3-2. Ecological Screening Evaluation Results Using Maximum Detected Soil Concentrations and No Effect ESLs.

COPEC	Maximum Detected Value (mg/kg)	American Kestrel (Avian Top Carnivore)	American Kestrel (Avian Insectivore/ Carnivore)	American Robin (Avian Herbivore)	American Robin (avian omnivore)	American Robin (avian insectivore)	Gray Fox (Mammalian Top Carnivore)	Mountain Cottontail (Mammalian Herbivore)	Montane Shrew (Mammalian Insectivore)	Deer Mouse (Mammalian Omnivore)	Earthworm (Soil-Dwelling Invertebrate)	Generic Plant (Terrestrial Autotroph-Producer)

Notes: Analytes shown in this table are above background and have at least one detected value.
Shaded cells indicate the initial screening ratio for HQs > 0.1, and HI > 1
Only detected data from the 0 to 6 foot depth interval are used; only inorganics above BV are evaluated as COPECs to this table

Abbreviations:
DRO – Diesel Range Organics
ESL – Ecological Screening Level
- – Not available
mg/kg – milligram per kilogram
TCDD - Tetrachlorodibenzodioxin[2,3,7,8-]
TEQ – Toxicity Equivalent Quotient
TPH – Total Petroleum Hydrocarbons

Table 3-3. Low Effect (LE) ESLs for COPECs.

Notes: Shaded cells represent HQs>0.1 or Hazard Index >1.
" - " indicates an ESL was not available and an HQ cannot be calculated.
Hazard Index is the sum of all HQs
See Tables 3-5 to 3-8 for dioxin/furan calculations and Table 2-8 for information regarding the UCL95 values for other organics
Abbreviations:

DRO - Diesel Range Organics
EPC – Exposure Point Concentration
HQ – Hazard Quotient
LE – Low Effect
mg/kg – milligram per kilogram
NA – Not applicable
TCDD - Tetrachlorodibenzodioxin[2,3,7,8-]
TEQ – Toxicity Equivalent Quotient
UCL95 – Upper 95th percent confidence limit

TEQ	**2.89E-06**		**1.22E-06**		**1.15E-06**		**1.90E-06**		**1.87E-06**	

Notes: The TECi are summed in each column to obtain the TEQ.
Subsurface soil samples (>1 foot deep) are shaded.
The duplicate pair is SFB-23-295637 and SFB-23-295638
Detect Code = 1 is detected, 0 is not detected

TEQ – Toxicity Equivalent Quotient, the sum of the TECs
TEC – Toxicity Equivalent Concentration, the product of the raw concentration and the receptor category specific TEF
TEF – Toxicity Equivalency Factor

TEQ	**3.80E-06**		**1.71E-06**		**1.59E-06**		**2.53E-06**		**2.24E-06**	

Notes: The TECi are summed in each column to obtain the TEQ.
Subsurface soil samples (>1 foot deep) are shaded.
The duplicate pair is SFB-23-295637 and SFB-23-295638
Detect Code = 1 is detected, 0 is not detected

TEQ – Toxicity Equivalent Quotient, the sum of the TECs
TEC – Toxicity Equivalent Concentration, the product of the raw concentration and the receptor category specific TEF
TEF – Toxicity Equivalency Factor

Notes: . " - " indicates an ESL was not available and an HQ cannot be calculated. Shaded HQ cells indicate the value exceeds the target HQ of 0.1.
Shaded HI cells indicate the HI exceeds the target of 1. HQs and HIs are rounded to one significant digit.
Area of Site = 0.8094 ha (2 ac)
ESLs - Ecological screening level
HR - Home range
NA - Not applicable
PAUF - Population area use factor
ha - hectare

a - Values from USEPA (1993)
b - Derived as 40*HR. PAUF is the area of site divided by the Population Area

Notes: . " - " indicates an ESL was not available and an HQ cannot be calculated. Shaded HQ cells indicate the value exceeds a target HQ of 0.1.
Shaded HI cells indicate the HI exceeds the target of 1. HQs and HIs are rounded to one significant digit.
Area of Site = 0.81 ha (2 ac)
ESLs - Ecological screening level
HR - Home range
NA - Not applicable
PAUF - Population area use factor
ha – hectare

a - Values from USEPA (1993)
b - Derived as 40*HR. PAUF is the area of site divided by the Population Area

Table 3- 10. PRGs for Ecological Receptors with LOAEL PAUF HQs> 0.1.

COPEC	Refined EPC (mg/kg)	PRGs (mg/kg)				
		Montane Shrew	Deer Mouse	Am. Robin	Earthworm	Plants
Barium	1363	-	-	-	3200	1400
Selenium	0.883	-	100	-	-	15
RDX	7.46	-	-	-	15	-
TCDD TEQ	1.88E-05	3.20E-05	7.00E-05	-	-	-

Note: Only barium produced an HQ> 1 (Table 3-9), and this was for plants
" - " the HQ was less than 0.1

GIS Program Los Alamos NATIONAL LABORATORY

Figure 3-1. Ecological Conceptual Site Model

Dermal and inhalation exposure are recognized as potentially complete pathways. These pathways are considered insignificant relative to ingestion exposure and are not quantitatively evaluated
The site area is 0.26 ac.
There is no riparian habitat. The shrew is retained as a potential receptor only as a surrogate for other mammalian insectivores that might occur.

C	carnivore	ING - Ingestion
IC	insectivore / carnivore	DC - Direct contact
TC	top carnivore	NA - Not applicable
H	herbivore	
I	insectivore	
O	omnivore

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Minimum	0.01	Mean	0.118

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects			
GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs			
GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)			
For such situations, GROS method may yield incorrect values of UCLs and BTVs			
This is especially true when the sample size is small.			
For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Gamma ROS Statistics using Imputed Non-Detects

GROS may not be used when data set has > 50% NDs with many tied observations at multiple DLs

GROS may not be used when kstar of detects is small such as <1.0, especially when the sample size is small (e.g., <15-20)

For such situations, GROS method may yield incorrect values of UCLs and BTVs

This is especially true when the sample size is small.

For gamma distributed detected data, BTVs and UCLs may be computed using gamma distribution on KM estimates

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.
Recommendations are based upon data size, data distribution, and skewness using results from simulation studies.
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

1 Introduction

This closure certification report summarizes the activities performed to meet Resource Conservation and Recovery Act (RCRA) closure requirements for an interim status open burning treatment unit at Technical Area (TA) 16 at the Los Alamos National Laboratory (LANL or the Facility). The TA-16-399 Burn Tray (Solid Waste Management Unit 16-010(d)) is listed in the LANL Hazardous Waste Facility Permit, Attachment K, Table K-1, *SWMUs and AOCs Requiring Corrective Actions* as requiring corrective action. The TA-16-399 Burn Tray was used for treatment of high explosives waste generated by the high explosives production and testing facilities at LANL under the regulations at Title 40 of the Code of Federal Regulations (40 CFR), Part 265, Subpart P, *Thermal Treatment*.

The need for thermal treatment operations at the Laboratory has decreased through the careful ~~scrutiny~~consideration of waste generating operations ~~and as~~. As a result ~~any~~, all necessary open burning treatments of waste explosives are managed at a single unit for the Facility. Additionally, the need for the type of waste treatment previously conducted the TA-16-399 Burn Tray ~~has been~~was phased out utilizing waste minimization techniques and identifying other uses for explosives that were once ~~were~~treated as waste at this location.

Closure activities were conducted in accordance with the New Mexico Environment Department – Hazardous Waste Bureau (NMED-HWB) approved closure plan, *Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray, January 2019* (NMED, 2019a~~)~~), and ~~any~~as amended (NMED, 2022a; NMED, 2023a; NMED, 2023b; and NMED, 2024). All additions and deviations are documented ~~herein~~in this certification report. Triad National Security, LLC and the U.S. Department of Energy (together named as the Permittees) provide this certification report ~~as documentation~~ of the clean closure of the hazardous waste management unit at the TA-16-399 Burn Tray.

1.1 Description of the Unit

TA-16 is ~~located~~ in the southwestern quadrant of the Facility at the west end of the Pajarito Plateau near the foothills of the Jemez Mountains. Elevation ranges from approximately 7,700 feet at the west end of the TA to approximately 6,800 feet at the lower east end. Topography is varied, ranging from steep canyon walls to sloping mesa tops. The open burning units at LANL ~~were~~are both located at the TA-16 ~~Burn~~Burning Ground and ~~consisted~~consist of the TA-16-388 Flash Pad and the TA-16-399 Burn Tray. The TA-16-388 Flash Pad is still in use today.

The TA-16-399 Burn Tray was comprised of a four~~-~~foot wide by 16~~-~~foot~~-~~long steel tray supported by 1.5-foot-high legs and was lined with firebricks. The maximum treatment capacity of the TA-16-399 Burn Tray was 1,000 pounds of waste per burn. The TA-16-399 Burn Tray was used to treat a single waste stream by open burning to destroy the characteristic of reactivity (D003). The bulk explosives of the waste stream ~~consisted of explosives including:~~included: cyclotrimethylene trinitramine (RDX); octahydro-1,3,5,7- tetranitro-1,3,5,7- tetrazocine (HMX); 2,4,6- trinitrotoluene (TNT); and triamino trinitrobenzene (TATB). Additionally, mixtures of explosives treated include~~:~~ ammonium nitrate-fuel oil (ANFO), Composition B, Cyclotol, IMX-101, PBX 9404, PBX 9407, PBX 9501, PBX 9502, PBX 9601, X0233, X0533, XTX 8003, XTX 8004, LX-02, LX-07, LX-10 and LX-14.

The waste explosives were packed in cardboard and wooden boxes and carefully transported to the unit for treatment. After the cover was rolled back from the tray, padding was placed on the tray while the explosives were removed from the boxes and set on the padding. The padding was then dampened with kerosene. Approximately one-half gallon of kerosene was used during each treatment event. Electric matches (*e.g.*, squibs) were then connected to the firing cables and a train of excelsior saturated with kerosene was run from the squibs to the padding for ignition. Ignition for all open burning treatment events occurred remotely from athe control building. The waste was allowed to burn on its own accord while being observed from the control building. After the burn was complete, the tray was allowed to cool before the burn tray cover was put back in place. Any residue or remaining ash was removed from the tray no earlier than 24 hours after treatment. Treatment methods at this unit were consistent throughout the life of the unit.

The burn tray operated as a treatment unit prior to 1980 through July 18, 2012. Generally, treatment events ranged in volume from 30 pounds to 350 pounds. ApproximatelySince 1980, approximately 255,685 pounds of waste was treated at the TA-16-399 Burn Tray since 1980. The .

1.2 Closure Activities and Closure Plan Revision History

This discussion is provided to outline of the revisions necessary to the closure plan and closure activities. Closure activities, as outlined in the original closure plan (NMED, 2019a), were conducted from February 2019 through September 2019. Soil concentrations for data collected in 2019 were lower than the established residential soil screening levels when compared directly to the screening levels. However, risk assessments concluded that cumulative risk remained above residential risk levels. With the NMED-HWB approval, and prior to the submittal of the original closure certification report, further soil removal activities were conducted, and additional soil samples were collected within the excavated area and analyzed for explosives. The detected concentrations confirmed that the risk levels in the area associated with explosives were decreased. The report, *Transmittal of Closure Certification Report for Technical Area 16-399 Open Burn Unit Los Alamos National Laboratory EPA ID #NM0890010515*, was submitted on February 20, 2020 (LANL, 2020) to the NMED-HWB. The report included the risk assessment with cumulative risk calculations above residential screening levels, descriptions of soil removal activities, and subsequent sample collection that decreased cumulative risk calculations. The report concluded that potential risk posed to human health and several ecological risk receptors was acceptable. The NMED-HWB's review of the closure certification report (NMED, 2020), determined that revised risk assessments were necessary to determine if the results met clean closure requirements and included comments regarding the risk evaluations.

In response to the NMED-HWB's review and subsequent disapproval of the initial closure certification report, the Permittees prepared a report titled *Response to the Disapproval Closure Certification Report for Technical Area 16-399 Open Burn Unit, Los Alamos National Laboratory, EPA ID#NM0890010515* (LANL, 2021b) and submitted it to the NMED-HWB in March 2021. The revised risk assessment included addition of analytical data collected at the site from 2009-2013 and updated the risk analyses based on the larger amount of analytical data. The revised assessment calculated a human health cancer risk of 2E-05 and a Hazard Index (HI) for noncancer risk of 3. The NMED-HWB issued a second disapproval letter on May 25, 2021. The disapproval included further comments for consideration to potentially decrease the calculated risk levels. After integrating the NMED-HWB's comments into the risk

assessment and discussion with the NMED-HWB technical staff, it was determined that further soil removal was the best path forward to achieve clean closure expectations. On August 3, 2021, the NMED-HWB approved the proposed path forward of further soil removal (NMED, 2021c).

In November and December 2021, the Permittees excavated soil from two separate areas to remove soils with elevated concentrations of high explosives compounds and dioxins/furans, which were the identified contributors to the elevated risk. After soil removal, confirmation sampling demonstrated a decreased risk attributed to dioxins/furans in the overall area of the TA-16 Burning Grounds. However, unexpectedly high concentrations of barium and high explosives concentrations were present directly under the location of the former burn tray.

In early January 2022, the Permittees informed the NMED-HWB of the findings and proposed that an amendment to the closure plan was necessary to move forward due to the unexpected concentrations of explosives and barium within the fenced area at the unit. The Permittees provided formal notification of the closure plan amendment (LANL, 2022a), and after confirmation from the NMED-HWB (NMED, 2022a), a Class 2 permit modification was submitted and processed (LANL, 2022b and NMED, 2022b), resulting in the *Amended Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray* ~~was operated as a treatment unit prior to 1980 through July 18, 2012.~~, *Revision 2*.

The planning and coordination of excavators, bins, trucks, and personnel to safely complete the closure activities outlined in Revision 2 of the closure plan took more time than anticipated. Additionally, scheduling of waste shipments, in coordination with space constraints for accumulation at the site and the disposal facility's ability to accept waste volumes, provided for additional complications to the project execution.

A total of 15 excavation events within the fenced area at the location of the former burn tray began on May 8, 2023, and the last excavation activity occurred on April 24, 2024. A total of 55 waste containers were sent to U.S. Ecology Nevada, Inc. in Nevada for treatment and disposal. Final soil verification sample collection occurred on May 14, 2024. Completion of the closure activities necessitated NMED-HWB approval of three additional requests for extension of time (NMED, 2023a; NMED, 2023b; and NMED, 2024).

This report, *Los Alamos National Laboratory Closure Certification Report for Open Burning Treatment Unit Technical Area 16-399 Burn Tray, Revision 1*, provides a summation of all field activities, soil laboratory analyses, and assessments performed to support clean closure of the open burning unit at the TA-16-399 Burn Tray.

2 Closure Performance

This section and subsections of this closure certification report include a description of the closure activities, deviations from the approved closure plan, results of sampling and ~~analysis~~analyses, treatment of the explosives-contaminated noncombustible debris, recycled materials, a summarization of disposition of ~~nonhazardous~~ waste, location of supporting documentation, and discussion of quality assurance and quality control. All closure activities were conducted in accordance with the approved closure plan (NMED, 2019a~~)~~), and as amended (NMED, 2022a; NMED, 2023a; NMED, 2023b; and NMED, 2024). Additions and deviations from the closure plan are documented in this report.

2.1 Additions and Deviations from the ~~Revised~~ Closure Plan

Because the closure plan was revised after some closure activities had been completed, the additions and deviations are described for each closure plan revision.

Descriptions of deviations from the approved plan are presented in the appropriate subsections, as indicated below. Discussions with NMED regarding the additions and deviations described in this closure certification report were conducted as presented in the extension requests, approvals, disapprovals, and responses to disapprovals included in referenced documents (LANL, 2019b; NMED, 2019c; LANL, 2019c; NMED, 2019d; NMED, 2020; LANL, 2021a; NMED, 2021a; LANL, 2021b; NMED, 2021b; LANL, 2021c; NMED, 2021c; NMED, 2022a; NMED, 2023a; NMED, 2023b; and NMED, 2024).

2.1.1 Deviations and Additions from Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray

The closure of the TA-16-399 Burn Tray was performed in accordance with the revised closure plan, ~~with the exception of~~except for additions and deviations from the approved closure plan ~~which~~, discussed in the following sections, to include:

- Notes regarding collection of tuff subsurface samplings as discussed in Section 2.2.3;
- Laboratory analytical method equivalencies (Section 2.2.4);
- Nitrate samples were not collected, and a duplicate sample was not collected in November 2021 (Section 2.2.3.1);
- Laboratory holding times which caused recollection of samples and missing analyte analysis (tetryl) (Sections 2.2.4 and 2.2.4.1.~~2~~1);
- ~~Nitrate samples not collected (Sections 2.2.3.1 and 2.2.4.1.1); and~~
- ~~Soil~~Three soil excavation ~~(Section 2.4).~~
- ~~Descriptions~~events and subsequent soil sampling prior to revision of ~~each of these deviations are presented in~~ the ~~appropriate subsections, as indicated above. Discussions with NMED regarding the deviations described in this~~approved closure ~~certification report were conducted as presented in the extension requests and approvals included in referenced documents (LANL, 2019b; NMED, 2019c; LANL, 2019c; and NMED, 2019d).~~plan (Sections 2.3, 2.4); and
- Inclusion of historic analytical information within the revised risk assessments (Section 2.5).

2.1.2 Deviations from Amended Closure Plan Open Burning Treatment Unit Technical Area 16-399 Burn Tray, Revision 2

The following is a list of deviations and changes from the closure plan approved on September 6, 2022 (NMED, 2022b).

- Notes regarding collection of tuff subsurface samplings as discussed in Section 2.2.3;
- Confirmation of the analysis method for PFAS, which were added as constituents of concern due to public comment (Section 2.2.4); and
- A duplicate sample was not collected in November 2021 (Section 2.2.3.1).

2.2 Closure Activities

Closure activities for the TA-16-399 Burn Tray began on February 28, 2019, with the submittal of a request to initiate the collection of soil samples for analysis at an off-site analytical laboratory. Closure activities were performed in accordance with the approved closure plan and subsequent coordination with the NMED~~. Closure activities concluded when the soil sampling analytical results from~~ HWB. Because of the ~~soil confirmation~~amendment of the closure plan (NMED, 2022b), it was determined by the NMED-HWB that the collection of samples ~~were confirmed to be below~~at all the closure plan identified ~~residential soil screening levels~~locations would reoccur. The following provides a description of each activity proposed in the closure plan as well as additional closure activities and evaluations conducted to meet the closure performance standard.

2.2.1 Structural Assessment

As required by the closure plan, the structural assessment with the NMED-HWB was conducted on July 19, 2012. Correspondence (LANL, 2019a) regarding the structural assessment was sent to the NMED-HWB in February 2019 and included a commitment by the Permittees to include photographs of the TA-16-399 Burn Tray prior to removal within the closure certification report. On April 22, 2019, photographs were taken of the TA-16-399 Burn Tray and the surrounding area to document the state of the unit's physical condition prior to commencement of the removal of structures and equipment. Photographs 1 through 6 within Attachment 1, *Photographs Prior to Equipment/Structure Removal* of this closure certification report depict the undisturbed area.

2.2.2 Removal of Structures and Equipment

Demolition activities were systematically conducted on April 22, 2019. Electricity was confirmed to be ~~off~~de-energized at the electric box located directly in front of the TA-16-399 Burn Tray, then the burn tray equipment (including the electric box) was removed. The burn tray tracks, rubber matting under the tracks, burn tray cover, firebrick, and the burn tray were removed from the site and placed in waste containers or covered with tarps to be protected from weather according to the appropriate waste characterization for each item. A central accumulation area was set up for the waste items that required treatment via flashing at the TA-16-388 Flash Pad prior to disposal or recycling. Items that required treatment were the steel tray, firebrick, and sand. The concrete pad was broken up in place and placed in a pile for characterization. After sampling and analysis confirmed the debris was a non-hazardous waste, the concrete was disposed of at a construction and demolition landfill. Photographs 7 through 16 within Attachment 2, *Photographs of Removal of Equipment/Structures,* depict the area during and

immediately after removal of the equipment and structures. All demolition activities were completed on April 22, 2019.

2.2.3 Soil Sampling

This section includes information regarding soil sample collection. Discussions associated with soil laboratory analysis are included in Section 2.2.4 and quality control/quality assurance in Section 2.7. Table 1, *Closure Plan Sample Locations Evaluated in Support of Closure Activities at the TA-16-399 Burn Tray*, provides a summary of all samples evaluated for use as part of this closure process. A description of the original reasoning for sample collection, as well as reasoning why a sample was not included in the risk evaluations are also provided in the summary table. Figure 2 includes a depiction of the locations ultimately included with the risk assessments. The soil sample collection procedures described herein only detail the activities conducted from 2019 to the present, as samples collected prior to that date may have followed different procedures and were not collected under the observation of the independent professional engineer. All required subsurface samples were collected with the intention of reaching the tuff or the soil/tuff interface as much as practicable with an auger or a shovel. Final verification samples within the excavated area included crushed tuff, as the excavation in most areas reached tuff. While this is not considered a deviation from the approved closure plan, it is noted for context.

2.2.3.1 Soil Sampling

~~Three~~Eight soil sample collection events were conducted for the closure of the TA-16-399 Burn Tray. A duplicate sample was collected on each day of soil sample collection activities~~.~~ except for November 17, 2021, and April 24, 2024 (described in Section 2.4).

Initial soil sample collection was completed on May 7, 2019. As prescribed by the original closure plan, 16 soil samples (including one duplicate sample) were collected from 11 locations at and surrounding the TA-16-399 Burn Tray (Figure 1).

Due to ~~unacceptable recoveries (out~~the analytical laboratory's exceedance of holding ~~time)~~times and unacceptable calculated relative percent difference ~~criteria~~ in the initial laboratory soil analysis, resampling activities were conducted on August 6, 2019. ~~Soil~~11 soil samples and a duplicate sample were collected ~~and~~ to be analyzed for specific analytical suites ~~for 11 soil samples were analyzed or re-analyzed by the laboratory. The soil analytical laboratory results are qualified accordingly in the results table (Table 1, Summary of Analytical Data for Closure of the TA-16-399 Burn Tray) included as Attachment 3.~~. Section 4.2 of the approved closure plan required that completion of closure activities be conducted within 180 days of the beginning of closure. Closure activities for the unit began on February 28, 2019; however, due to the ~~need~~necessity to resample soils, a 30-day extension ~~request~~ was requested and granted to complete closure activities by September 26, 2019 (LANL, 2019b and NMED, 2019c).

The ~~final soil sample event for~~third soil confirmation sample collection was completed on December 4, 2019, after soil was removed from a portion of the site as described in Section 2.~~4,~~3, *Initial Removal of Soil and ~~Subsequent~~Verification Sampling*.

The fourth and ~~*Analysis.*~~ fifth soil sampling events occurred on November 17, 2021, and December 1, 2021, after soil was removed from two locations at the site as described in Section 2.4.1, *2021 Additional Removal of Soil and Verification Sampling*. Sixteen samples were collected from two excavated locations. Because the two excavations were not conducted on the same day, a duplicate sample on November 17, 2021, was inadvertently not collected. The sample locations within the excavated fenced area were later excavated as part of the 2023 and 2024 closure activities.

The final three soil sampling events occurred on August 16, 2023, October 26, 2023, and May 14, 2024. These soil samples were collected from 11 locations outlined in the original approved closure plan (NMED, 2019a), at and surrounding the TA-16-399 Burn Tray. Three locations were added as part of the revision of the approved closure plan (NMED, 2022a), as baseline locations for per- and polyfluoroalkyl substances (PFAS). Additional verification sample locations were also required as part of the revised closure plan (NMED, 2022a). On August 16, 2023, fifteen soil samples (including 1 duplicate sample) were collected from nine locations outside of the fenced area at the TA-16-399 Burn Tray. On October 26, 2023, 14 soil samples (including one duplicate sample) were collected from within the fenced area at five closure plan dictated locations, and seven chosen verification sample locations. Five locations for verification samples were within the excavated area, and two were located just outside the excavated area. Lastly, four soil samples were collected on May 14, 2024, after a final excavation was determined to be necessary to complete closure activities. Two soil samples were collected from former verification sample locations, one sample from an additional location within the excavated area, and one sample outside the excavated area. A duplicate sample was not collected on this day.

All soil samples were collected as specified in the soil collection procedures outlined in Section 6.1.1 of the approved closure plan (NMED, 2019a~~).~~) and subsequent amendments as appropriate (NMED, 2022a; NMED, 2023a; NMED, 2023b; and NMED, 2024). For surface soil sampling, a Bel-Art™ Sterileware™ Sampler Scoop was used to disturb the soil at the sampling location and a small portion of the soil to be sampled was visually examined by an Explosives Safety Officer and then a high explosives spot test was conducted on the soil. The scoop was used to fill sample containers per the analytical laboratory directions. For subsurface samples, a metal auger or shovel was used to remove approximately the necessary soil (usually 6 inches ~~of soil.~~). The soil from approximately 6-12 inches below the ground surface was collected within a stainless ~~-~~ steel bowl and an Explosives Safety Officer visually inspected and then performed a high explosives spot test on the soil. A scoop was then used to fill sample containers as directed by the analytical laboratory requirements. All samples that tested positive for the high explosives spot test were managed and released from the area as explosives-contaminated material; however, the soils were determined to not present an explosive hazard. Soil samples collected for dioxin/furan analysis were sent to Cape Fear Analytical, LLC in Wilmington, North Carolina for analysis. All other soil samples (including those described in ~~Section~~Sections 2.3 and 2.4) were sent to GEL Laboratories LLC in Charleston, South Carolina.

2.2.4 Laboratory Analysis

Section 6.1.2 of the closure plan ~~listed~~lists specific methods within the U.S. Environmental Protection Agency (EPA) *Test Methods for Evaluating Solid Waste, Physical/ Chemical Methods* (SW-846) for conducting laboratory analyses. There were three deviations from those methods.

1. Metal analysis was conducted utilizing Methods 6020, 7471A, and 6010C. Method 6010B is listed in closure plan Table 4 with an allowance for approved updates.
2. Semi-volatile organic compound analysis was conducted utilizing Method 8270D, rather than 8270C. This is also an update to the method listed in closure plan Table 4.
3. Nitrate analysis was conducted using EPA Method 300.0 rather than Method 9056A. Both methods detect inorganic anions by ion chromatography and the method used is considered equivalent.

Additionally, PFAS analysis was conducted utilizing a modified version of the EPA Drinking Water Laboratory Method 537: Determination of Selected Perfluorinated Alkyl Acids in Drinking Water by Solid Phase Extraction and Liquid Chromatography/Tandem Mass Spectrometry (LC/MS/MS). A letter (LANL, 2023) sent to the NMED-HWB confirmed the use of this method.

Portions of the soil sampling ~~had to be~~were conducted a second time, as described in Section 2.2.3.1 of this report. Three volatile organic compound samples, four mercury samples, and two nitrate samples were resampled and analyzed to fulfill analytical requirements of the approved closure plan (NMED, 2019a). Two other planned nitrate resamples were inadvertently not collected ~~as explained in Section 2.2.4.1.1.~~during this time. However, because these samples were collected for the 2023-2024 closure activities, the detailed description of this deviation was removed from this report.

~~Also~~In addition, as described in Section 2.2.4.1.~~2~~1, soil laboratory analytical results for tetryl in 2019 and 2020 were rejected and therefore were not included in any comparisons or the risk ~~assessment~~assessments. Analytical results for tetryl from past sampling events (2009, 2012, and 2013) and data from 2021, 2023 and 2024 are included as part of the human health and ecological risk assessments in Attachment 6 at the request of the NMED (NMED, 2020). Tetryl was not detected to be present at the site in any of the samples collected in 2009, 2012, 2013, 2020, 2021, 2023 and 2024, indicating that there is not likely tetryl present at the site. All data utilized in the analysis is present on the CD included as Attachment 4.

2.2.4.1 Data from Laboratory Analyses for Closure Plan Required Soil Samples

Soil laboratory analytical ~~result comparisons to the NMED-accepted soil screening levels, and other pertinent information, are~~ results are summarized in ~~Table 1~~Attachment 3, *Summary of Analytical Data ~~for Closure of the TA~~ Utilized in Technical Area 16-399 Burn Tray Human Health and Ecological Risk-Screening Assessments Revision 3.0,* of this closure certification report. ~~Most soil analytical results are below residential soil screening levels for the soil constituents required by the closure plan and as evidenced by the comparison columns within Table 1.~~This table includes data utilized as part of the risk assessment analysis. Rejected data are not represented within the summary table~~,~~ but are included on the compact disc (CD) included as Attachment 4 and are discussed below. ~~The following subsections provide some~~Detailed discussion about the detections that are above, or appear to be above, soil screening levels ~~as well as positive findings within the data presented in Table 1~~ that require clarification~~.~~

~~2.2.4.1.1 Discussion of Detected and Non-Detected Analytes~~

~~Out of the 319 explosives analyses conducted, there were 52 detections of explosives (mostly in trace quantities). RDX was detected in 7 of the 16 soil samples collected. All detections of RDX were found in~~

~~soil samples collected within the fenced area directly around the location of the Burn Tray (Figure 2). The residential cancer soil screening level for RDX is 8.31E+01 milligrams/kilogram (mg/kg), and the residential noncancer soil screening level is 3.01E+02 mg/kg. The RDX detections were:~~

- ~~Sample location 3, 3.72E+01 mg/kg~~
- ~~Subsurface sample location 3s, 2.98E+01 mg/kg~~
- ~~Sample location 4, 3.92E+00 mg/kg and 5.13E+00 mg/kg~~
- ~~Sample location 5, 7.24E+01 mg/kg~~
- ~~Sample location 11, 6.07E+02 mg/kg~~
- ~~Subsurface sample location 11s, 4.94E+00 mg/kg~~

~~A surface soil sample collected from where the concrete pad was removed (sample location 11) contained an RDX concentration above residential soil screening levels. A soil removal action and confirmation sampling were conducted to address the elevated RDX concentration as~~ are discussed ~~in Section 2.4, *Removal of Soil and Subsequent Sampling and Analysis*.~~

~~Many dioxin and furan constituents were detected; however, comparison directly to soil screening levels is not appropriate for these types of contaminants. When comparing dioxin and furans concentrations to soil screening levels, the many congeners of dioxins and furans undergo an equivalency calculation so that all of the congeners can be cumulatively compared to a single soil screening level. Specific hazard discussions associated with these detections and the associated risk to human health and the environment are discussed~~within Attachment 6: *Technical Area 16-399 Burn Tray Human Health and Ecological Risk Screening Assessments, Revision 3.0*. Data tables for all data utilized within the risk ~~assessment (Attachment 5).~~

~~All detections of diesel range organics (DRO) are below the residential exposure level (1.00E+03 mg/kg) in the *New Mexico Environment Department*~~ assessments is present~~Risk Assessment *Guidance for Site Investigations and Remediation* (NMED, 2019b). There were no detections of gasoline range organics (GRO) or kerosene.~~

~~Soil analytical results for antimony, barium, calcium, copper, lead, selenium, silver, and zinc all had concentrations measured above established background values. However, no inorganics were measured to be above applicable residential soil screening levels. The detected concentrations of metals above background levels is depicted~~ on ~~Figure 3 and background values for these metals are summarized below:~~

- ~~Antimony - 8.30E-01 mg/kg~~
- ~~Barium - 2.95E+02 mg/kg~~
- ~~Calcium - 6.12E+03 mg/kg~~
- ~~Copper - 1.47E+01 mg/kg~~
- ~~Lead - 2.23E+01 mg/kg~~
- ~~Selenium - 1.52E+00 mg/kg~~
- ~~Silver - 1.00E+00 mg/kg~~
- ~~Zinc - 4.88E+01 mg/kg~~

~~Perchlorate was non-detect in all of the soil samples. Although nitrate was detected in every sample collected, four of the eighteen samples collected were rejected due to analyses that were out of the~~

~~sample hold time. Two of the four samples were recollected and analyzed. Two were inadvertently not recollected during the August 2019 sampling event. However, the two samples that were not recollected at the surface sample at location 10 and the subsurface sample at location 6 are located to the north of the unit and outside of any direct line of runoff from the unit and opposite the predominant wind direction at the unit.~~the CD included as Attachment 4 for facilitating review. Additionally, ~~all detections of nitrate are, at a minimum, four orders of magnitude less than the residential soil noncancer screening level (1.25E+05 mg/kg); therefore, it is not likely that the former operations at the TA-16-399 Burn Tray contributed to concentration of nitrate in the area or that the concentration of nitrate at the site could be above any of the applicable soil screening levels. Figure 4 depicts detected nitrate soil concentrations~~Attachment 4 includes analytical data packages sent with the analytical data to the Permittees.

~~Figure 5 includes other organic constituents that were detected at the site. There were no other analytes detected above applicable soil screening levels.~~

~~2.2.4.1.2~~2.2.4.1.1 ~~Other~~ Analytical Discussion

Some other data points included in Table 1 require additional discussion for clarification. These data points are ~~discussed below.~~briefly discussed below. Additional detailed information and discussion regarding the full dataset utilized in the assessment for clean closure is included in the risk assessments (Attachment 6) and is present on the CD included as Attachment 4.

~~Dibenz(a,h)anthracene appears to be detected in two soil samples. The one sample where the chemical is actually detected (collected from sample location 11), is at a concentration below all soil screening levels. The measured concentration is 1.99E-02 mg/kg and the residential cancer screening level is 1.53E-01 mg/kg. In another sample, the reported detection limit for the sample is above the residential soil cancer screening level (1.53E-01 mg/kg). However, the sample is a duplicate sample for sample location 4, and the reported detection limit for the original sample (5.07E-02 mg/kg) is below the residential soil cancer level; therefore, the sample is considered a non-detect for dibenz(a,h)anthracene. Dibenz(a,h)anthracene is formed during the incomplete burning of coal, gas, oil, wood, garbage, tobacco and charbroiled meats and is not likely to be present at the TA-16 Burn Ground.~~

~~N-nitrosodimethylamine has no detections; however, the reported method detection limits and the report detection limits are all greater than the residential soil cancer screening level of 2.34E-02 mg/kg. The constituent is listed as non-detected within the analytical data report. N-nitrosodimethylamine is a volatile, combustible, yellow, oily liquid nitrosamine with a faint characteristic odor that decomposes when exposed to light and emits toxic fumes of nitrogen oxides when heated to decomposition. N-nitrosodimethylamine is primarily used in laboratory research to induce tumors in experimental animals. This substance may be formed during the cooking of foods, especially cured meats and fish, that contain sodium nitrite as a preservative, but is also found in several vegetables, cheeses, alcoholic beverages and fruits, and as a contaminant in rubber products. It is not likely that n-nitrosodimethylamine would be present at the TA-16 Burn Ground based on past operations.~~

~~Hexachlorocyclopentadiene is another chemical that has no detections; however, in one instance the reported method detection limit and the reported detection limit are greater than the residential soil noncancer screening level (2.30E+00 mg/kg). Hexachlorocyclopentadiene appears as a pale yellow liquid~~

~~with a pungent odor. It is a manufactured chemical that does not occur naturally. It easily evaporates into the air and is used in the manufacture of certain pesticides. Most of the hexachlorocyclopentadiene in the environment results from releases during its production and disposal. It is also not likely that hexachlorocyclopentadiene would be present at the TA-16 Burn Ground.~~

Samples analyzed for the compound tetryl were not analyzed by the analytical laboratory properly and were rejected. All ~~of~~ the required spiking analytes were not within the acceptance limits in the laboratory control sample for tetryl and re-extraction was not performed because the samples exceeded the method stated holding time. Specific information regarding these laboratory quality issues is included on the CD (Attachment 4) within the data package for 2019-1826. ~~Recollection~~Re-collection of samples to be analyzed for tetryl was not conducted as the control sample issues had not been resolved with the analytical laboratory at the time of resampling and likely, the results for the ~~recollected~~re-collected samples would duplicate the results of the original samples. However, soil samples were collected in August 2012 during the original anticipation of closure plan approval and while preparing a submitted permit modification request. Laboratory analytical results found no detections of tetryl in any of the soil samples collected at that time. The August 2012 soil sample locations are the same soil sample locations included within the closure plan that was sent out for public notice by the NMED-HWB in November 2013 that ultimately became the approved closure plan. While those data are not used as comparison values within this closure certification report, they are included on the CD included as Attachment 4 and indicate that tetryl is not present at the site.

All data packages received from the analytical laboratories are also included on the CD ~~included as part of~~
(Attachment 4~~.~~). Analytical results, from this event as well as others, were further analyzed in ~~a~~human health and ecological risk ~~assessment~~assessments included as Attachment ~~5~~6 of this closure certification report. The risk assessments are discussed in Section 2.5.

~~2.3 Risk Assessment~~

~~The risk assessment presented in Attachment 5, *Technical Area 16-399 Burn Tray Human Health and Ecological Risk-Screening Assessments* concluded that there was some potential risk to human health due to possible exposure to RDX. For the human health risk assessment, the screening level hazard indexes (His) for inorganic constituents were calculated as 1 for the hypothetical future resident and 0.09 for current and future workers. Most of the risk associated with organic compounds was associated with a single surface sample (sample location 11) with a detected concentration of RDX at 6.07E+02 mg/kg. This results in a cancer-based ratio of the refined exposure point concentration for residents of an HI of 4; for site workers the ratio is an HI of less than 1. Noncancer ratios are HIs of less than 1 for both resident and worker receptors. Human health risk at the TA-16-399 Burn Tray is determined by the risk assessment to be minimal and associated with one sample. Risk estimates are elevated only for the hypothetical future resident and not current or future workers, which are the likely receptors at the TA-16-399 Burn Tray for the foreseeable future.~~

~~Additionally, the risk assessment concluded that there existed a potential risk to several ecological receptors regarding potential for adverse ecological effects for exposure to soils. Barium and RDX exceed toxicity values for plants and invertebrates. However, photographs of the site both before and~~

~~after demolition activities show healthy vegetation within the immediate and general area surrounding the location of the former burn tray; therefore, it is unlikely that plants and invertebrates are being impacted by barium levels within the soil. Small mammal receptors were calculated to have a potential risk due to the concentrations of dioxin/furan concentrations at the site. The small mammal tissue study conducted at the site indicated little uptake of dioxins/furans by small mammals at TA-16 as a whole, as well as little effect on mammal populations. Eggs analyzed for inorganics had antimony and mercury concentrations above egg background values, but mercury concentrations were below known toxic levels. Antimony was detected in one of four egg samples and half of the soil samples, and concentrations do not appear widespread. Population metrics for birds in the area have not been measured to be statistically significantly different from controls. The weight of evidence described in the risk assessment shows that no effects have been observed for mammals and birds based on monitoring activities that have been conducted in the area over multiple years. Therefore, there is a minimal risk to ecological risk receptors at the site. Based on the elevated RDX soil concentrations and the human health risk screening assessment, the Permittees determined that the site required additional closure activities to meet the closure performance standard (residential clean-up levels) as required by Section 4.1 of the approved closure plan.~~

~~2.4~~2.3 Initial Removal of Soil and ~~Subsequent~~Verification Sampling ~~and Analysis~~

~~Upon~~Based on the ~~conclusion~~conclusions of the original risk ~~assessment~~assessments (discussed in Section 2.~~3~~5), it was determined that soil should be removed ~~from the area~~at soil sample location 11, the location of the former concrete pad, where the soil concentration of RDX was detected at a concentration of 600 parts per million (ppm). Based on this determination, a second extension request was submitted and granted to complete closure activities by December 25, 2019 (LANL, 2019c and NMED, 2019d).

~~Soil sample location 11, at the location of the former concrete pad was determined to be an area with a higher concentration of explosives and plans were developed to remove soils in the area around the sample location.~~ Soil removal was guided utilizing high explosive field tests and an Explosives Safety Officer to support the extent of the soil removal. On December 4, 2019, soil ~~excavation removed soil~~was excavated to a depth of 9-15 inches from an area measuring approximately 19 feet by 6.6 feet surrounding sample location 11 ~~(Figure 6).~~. Approximately 125 cubic feet of soil was removed, sampled, and containerized to be characterized and disposed of off-site as ~~non~~hazardous waste due to barium concentrations. Photographs 17 through 21 within Attachment 6, *Photographs of Removal of Soil and Confirmation Soil Sampling Activities* depict the area during and immediately after removal of soil and depict an example of surface and subsurface soil sample collection.

On December 4, 2019, confirmation soil samples were collected from the newly excavated soil surface at the original soil sample ~~location~~locations and at each of the excavation boundaries. Additionally, at each of the four excavation boundaries, soil samples were collected from a depth of 6-12 inches below the excavated soil surface. All ~~of~~ the soil samples were analyzed for high explosives ~~concentrations.~~constituents. Confirmation sample laboratory analytical results for RDX were compared to applicable NMED approved soil screening levels (SSLs) for residential risk screening scenarios, 8.31E+01 mg/kg (cancer) and 3.01E+02 mg/kg (non-cancer). All detected explosives constituent concentrations were below the applicable residential ~~soil screening level. Analytical results are included~~

~~within Table 2 of Attachment 7, *TA-16-399 Analytical Results after Excavation* of this closure certification report. Figure 6 includes detected concentrations of high explosives after the excavation of soil.~~SSLs.

Established storm water controls and vegetation were left in place to ensure continued stabilization of the area and to prevent sediment from migration off-site. The excavation area was backfilled with base course and graded to match existing slope.

2.4 Additional Removal of Soil and Verification Sampling

After the second review of the risk assessments provided to the NMED-HWB, the Permittees received further comments regarding evaluations that could be conducted to reduce the calculated risk for the site. After conversation with the NMED-HWB and technical subcontract personnel, the Permittees proposed removal of soil from two locations within the unit boundary and south of the unit. The location south of the unit was identified as a location where higher levels of dioxin/furan congeners were previously measured. The location within the unit boundary was identified as a single location where a barium concentration was an order of magnitude greater than other measured concentrations within the area. However, it should be noted that barium is known to be above background values over the entire mesa top in this area.

The second soil removal effort occurred on November 17, 2021, south of the unit boundary in a drainage area. This is the location higher levels of dioxin/furan congeners were measured in past sampling and analytical events (2012 and 2013). The area excavated is estimated to be 900 square feet and 8 to 12 inches deep. This is approximately 494.4 cubic feet of soil that was stored in a roll-off bin and shipped offsite as nonhazardous waste. Six verification samples were collected from the area and were analyzed for metals, high explosives, and dioxin/furan congeners. Analytical results showed no high explosives present in the area, two detections of barium above background values, and a decrease in the concentration of dioxin/furan congeners in the area. Because it was determined that there were not enough empty waste containers present at the site to provide containerization of the last excavation site, the final soil excavation was rescheduled. Due to the rescheduling, a duplicate field sample was inadvertently not collected on the second day.

On December 1, 2021, soil was removed from the area directly under the former location of the TA-16-399 Burn Tray. The excavated area measured approximately 33-34 feet in length and 15-20 feet in width to a depth of 11 to 18 inches. Approximately 974.68 cubic feet of soil was placed in three roll-off bins and 10 verification samples were collected from nine locations within the boundaries of the excavation. These samples were analyzed for metals, high explosives, and dioxin/furan congeners. Analytical results showed elevated concentrations of barium at the new soil surface and increased concentration of RDX in 2 of the 10 samples collected. Additionally, concentrations of aluminum, cadmium, calcium, chromium, copper, silver, and zinc were detected above background values within the excavated area. Additional explosives compounds detected include TNT, amino-2,6-dinitrotoluene [4-], amino-4,6-dinitrotoluene [2-], trinitrobenzene [1,3,5-], TATB, PETN, and HMX. Dioxin/furan congeners were detected in expected quantities for the area.

2.5 Excavation Activities After Amendment to Closure Plan

After an amendment to the approved closure plan (NMED, 2022b), additional excavation within the fenced area commenced on May 8, 2023. Fourteen excavation events took place while balancing the available areas for accumulation of waste containers, availability of waste containers, and ability of the off-site treatment and disposal facility to accept the waste that contained soil with non-detonable quantities of explosives and hazardous levels of barium. This resulted in the generation and shipment of 54, 20-cubic yard roll-off bins of contaminated soil and debris. Upon receipt of the analytical data from the October 26, 2023, soil sampling event, it was determined that an additional excavation event was necessary to complete closure activities. On February 15, 2024, NMED-HWB approved the final extension request for additional time to complete the final excavation event and collect final verification sampling (NMED, 2024). The excavation resulted in the generation of a final 20-cubic yard roll-off bin on April 24, 2024, for a total of 15 excavation events, and a total of approximately 15,930 cubic feet of waste shipped offsite. The final excavation will be backfilled with clean fill as soon as practicable. The fill will be graded to ensure that storm water control best management practices established at the site are still effective. Final verification sample collection took place on May 14, 2024. Figures 3, 4, and 5 depict the final concentrations of explosives, toxic equivalency (TEQ) values of dioxin/furan congeners, and other inorganic compounds. An additional figure depicting the few PFAS concentrations detected has been included as Figure 6 for completeness.

2.6 Risk Assessment

The risk assessments associated with the TA-16-399 Burn Tray were revised three times, based on recommendations of the NMED-HWB. Potential adverse risk at the site, as presented by the Permittees, is summarized in the following sections. Target levels for a residential risk scenario are an HI of 1 and a cumulative cancer risk of 1E-05.

2.6.1 Revision 0.0 in February 2020

The original risk assessments concluded that there was some potential risk to human health and several ecological receptors due to possible exposure to RDX. Risk assessments included with the closure certification report were based on the 16 soil samples collected from 11 locations as required by the approved revised closure plan (NMED, 2019a).

2.6.2 Revision 1.0 in February 2021

As required by the NMED-HWB (NMED, 2020), Revision 1.0 of the risk assessments included analytical data for organic and inorganic compounds at the site from 2009, 2012, 2013, 2019, and 2020.

The risk assessments included an evaluation of all the data recommended by the NMED-HWB and a more focused evaluation based on the area immediately surrounding the former location of the burn tray. The cumulative cancer risk based on all the datasets was 2E-05 and the noncancer HI was 3. When only the area surrounding the tray was evaluated, cumulative cancer risk was 1E-05 and the HI was 2. Lead was considered separately, and the hazard quotients for lead were less than 1 for all receptors. The ecological risk assessment concluded that there was some risk to several ecological receptors, but the calculated risk was relatively low, and data collected at the site showed no species impact.

2.6.3 Revision 2.0 in January 2024

Revision 2.0 of the human health and ecological risk assessments was not formally transmitted to the NMED-HWB, as it was determined that an amendment to the closure plan was necessary to complete clean closure activities. The revision included analytical data for organic and inorganic compounds at the site from 2009, 2012, 2013, 2019, 2020 and 2021 as required by the NMED-HWB (NMED, 2020), and as proposed by the Permittees (LANL, 2021c).

Analytical data for sample locations that were excavated were deleted from the risk assessment dataset and risk estimates were recalculated based on the revised dataset. Four organic analytes dropped out of the analysis because they were no longer detected, and two additional metals were carried forward as they were detected above background concentrations. Risk due to barium increased and hazard quotients (HQs) based on the refined exposure point concentrations were above 1 for construction worker scenarios. Risk due to two explosives increased based on the refined exposure calculations. Amino-2,6-dinitrotoluene [4-] HQs that were less than 1 were now 4 for the residential scenario based on the revised dataset, and 2,4,6 TNT concentrations also increased for the residential scenario and the HQ for residential use was now 2. Dioxin/furan cancer risks and HQs were now below target levels of 1E-05 and 1, respectively. Three analytes exceeded the migration to groundwater values based on refined exposure concentrations. These were barium, RDX, and 2,4,6 TNT. The cumulative cancer risk based on all the dataset was 2E-05 and the noncancer HI was 7.

Additionally, many maximum concentrations exceeded the ecological screening levels. Based on refined exposure concentrations, barium, selenium, amino-2,6-dinitrotoluene [4-], bis(2-ethylhexyl) phthalate, RDX, dioxin/furan congeners, and 2,4,6 TNT produced HQs above 1 for ecological receptors. Overall, these HQs were low, and the HIs were 2 or less for mammals and birds, 10 for soil fauna, and 50 for plants. The major risk driver for ecological risk receptors was barium and further excavation was deemed necessary.

2.6.4 Revision 3.0 in July 2024

After completion of the April 2024 excavation, the risk assessment evaluations were revised to include the data summarized in Attachment 3 of this closure certification report. Attachment 6, *Technical Area 16-399 Burn Tray Human Health and Ecological Risk Screening Assessments, Revision 3.0*, details the human health and ecological risk assessments for residual calculated risk at the site. Analytical data for sample locations that were excavated were deleted from the risk assessment dataset and risk estimates were recalculated based on the revised dataset. Table 1, Closure Plan Sample Locations Evaluated in Support of Closure Activities at the TA-16-399 Burn Tray, presents the soil samples included in the risk assessments.

Inorganics were compared to background value and risk-based soil screening levels. Six inorganics exceeded background values, and four of those exceeded background based on hypothesis testing. No inorganics exceeded human health risk-based screening levels. Several organics were detected, along with some explosives compounds and breakdown products, some semi-volatile organic compounds, and total petroleum hydrocarbons and diesel range organics. Maximum concentrations of detected analytes in surface soil were below industrial worker soil screening levels and maximum concentrations of the detected analytes in subsurface soils were below risk-based residential screening levels for all

constituents except the dioxin/furans. Maximum concentrations were also below construction worker soil screening levels in subsurface soils.

When refined exposure point concentrations were considered, no constituents were above target levels for cancer risk or noncancer hazard for any receptor. The cumulative cancer risk based on refined exposure point concentrations for surface soils for industrial workers is 9E-07, and the noncancer HI is 0.04. The cumulative cancer risk based on refined exposure point concentrations for subsurface soils was 6E-06, and the HI was 0.6, for residents. The cumulative cancer risk and HI were below target levels for construction workers at 1E-07 and 0.4, respectively.

Refined exposure point concentrations for three detected analytes exceeded migration to groundwater screening levels. These were amino-2,6-dinitrotoluene [4-], amino-4,6-dinitrotoluene [2-], and RDX. There are also no maximum contaminant level drinking water standards for these three analytes. Detections for both amino-2,6-dinitrotoluene [4-] and amino-4,6-dinitrotoluene [2-] had so few detections that statistics are likely biased high. In addition, the distance to groundwater from the site provides for an unlikely source of addition of contamination to groundwater from explosives compounds. The facility includes an extensive facility-wide monitoring program that is well managed.

Although these screening levels were calculated to be exceeded, the site is deemed to be a low-priority source for its potential impact to groundwater. High- and moderate-ranking sources were characterized by significant hydrologic drivers, i.e., either large outfall volumes released to canyons or ponds located on mesa tops. Sources were also characterized in terms of the release of large inventories or high contaminant concentrations. Both conditions are necessary to consider an area to have a high or moderate impact to groundwater. Therefore, the TA-16 Burning Ground area is ranked as a low-priority source for its potential to impact groundwater, because it lacks both a large contaminant inventory and a large volume of water to provide a hydrologic driving force for contaminant infiltration.

Concentrations of constituents also exceeded low-effect ecological screening level values for a few of these same constituents and receptors. Barium, selenium, and zinc exceeded values with HQs above 0.1. Concentrations for the explosive RDX; bis(2-ethylhexyl) phthalate; and dioxin/furan TCDD TEQ resulted in HQs above 0.1 for comparison to low-effect ecological screening levels. HIs were above 1 for all receptors except the American kestrel (*Falco sparverius*) modeled as a top carnivore or insectivore/carnivore, gray fox (*Urocyon cinereoargenteus*), also a top carnivore, mountain cottontail (Sylvilagus nuttallii), a mammalian herbivore, and earthworms.

After further refining of the population area use, there remain a few HQs above 0.1 for vertebrate receptors. HQs for barium were above 0.1 for earthworm and plants, HQs for selenium were above 0.1 for deer mouse and plants, HQs for RDX exceeded 0.1 for earthworm, and the HQs for TCDD TEQ exceeded 0.1 for montane shrew and deer mouse. The HI for deer mouse was 2, and the HI for plants was 6. The potential risk for plants is elevated due to barium; however, the area is generally kept free of much vegetation because of the nearby operating site adjacent to the former burn tray.

~~2.5~~2.7 Disposal or Decontamination of Equipment, Structures, and Soils

Wastes generated ~~as a result of~~from closure activities (i.e. sand, firebrick, metal, rubber, soil) were managed and ~~will be or~~ have been disposed of as discussed in Section 2.2.2, Section 2.3, Section 2.4, and

Section 2.45 in accordance with Section 7.0, *Waste Management* of the approved closure plan (NMED, 2019a). Scrap metal and other materials determined to be not explosives-contaminated by an Explosives Safety Officer through visual examination and high explosives spot tests were released for disposition from the High Explosives Area with no other required actions. Prior to shipment off-site for disposition, the firebrick, sand, and burn tray required treatment for explosives contamination at the TA-16-388 Flash Pad. Excavated soil from the site ~~will be~~was disposed of at ~~a construction and demolition landfill~~US Ecology Nevada, Inc. as explosives-contaminated ~~nonhazardous~~hazardous waste. Most sampling equipment used (i.e. scoops, personal protective equipment) was disposable ~~(~~as nonhazardous waste~~)~~ and did not require decontamination. The auger, compositing bowl, and some scoops (as needed) were decontaminated utilizing Fantasik™ (a non-phosphate surfactant detergent that is already mixed with water) or deionized water and wipes. No excess liquid was used, and the waste wipes were disposed of as nonhazardous waste.

~~2.6~~2.8 Location of Supporting Documentation

The following supporting documentation will be retained by the environmental waste compliance personnel at LANL.

- Field logs
- Laboratory sample analysis reports
- QA/QC documentation
- Chain-of-custody records

~~2.7~~2.9 Statement of Quality Assurance/Quality Control Adequacy

A review of the sampling and shipping procedures and analytical data was conducted by environmental waste compliance personnel. ~~With the exception of~~Except for the caveats and the resampling event described in Sections 2.2.3.1~~, 2.2.4.1.1,~~ and 2.2.4.1.~~2~~1, it was determined that the analytical data related to closure of the TA-16-399 Burn Tray are of an acceptable quality and should therefore be accepted as valid. Resampling rectified a percentage of the quality control issues with the initial analytical data. Other quality control issues can be refuted through inference about the site and historically collected data. Analytical data packages are included within Attachment 4 of this report.

3 Conclusions

Closure activities as described within this closure certification report demonstrate that closure was performed in accordance with the approved closure plan as well as additional activities as discussed with and approved by the NMED-HWB. Based on the conclusions of the risk ~~assessment~~assessments (Attachment ~~5), additional actions were necessary~~6), target levels for a residential risk scenario (cumulative cancer risk of 1E-05 and HI 1) have been achieved, and acceptable potential risk to ~~meet closure performance standards. Soil~~ ecological receptors remains at the site. After extensive soil removal activities were conducted ~~in December 2019 and~~ at the site, contaminant concentrations measured in ~~confirmation~~verification samples were found to be ~~less than residential soil screening levels, meeting the closure performance standard. Closure performance standards generally take into account the future use of the site over 30 years.~~successful in reducing risk at the Unit.

The area at the overall site is well vegetated (see photographs included in Attachment 1), and there is no indication of an adverse effect at the site to plants or invertebrates, and as described in the risk assessment, there have been no observed effects for mammals and birds at the site based on various monitoring activities conducted at the site and referenced in the risk assessment (Attachment 6).

The site exists within the active, operational area of TA-16 and lies entirely on U.S. Department of Energy (DOE) land. The site is isolated from public access by a security fence and security checkpoints. Based on the current and proposed future land use, the site will remain under Facility (or DOE) control and will continue to be used for industrial purposes. Potential human exposure pathways include inhalation of airborne particles, incidental ingestion of surface soil or tuff, and dermal contact with surface soil or tuff. The potential on-site human receptors for both current and reasonably foreseeable future land use are LANL employees~~,~~ and for industrial ~~and recreational~~ land uses. However, residential land use is assumed to conservatively support closure certification decisions. Additional clean-up (e.g., soil removal) at the Unit is not recommended and the Unit should be approved for clean closure as defined within the approved closure plan (NMED, 2022b). For comparison purposes, a version of this closure certification report has been compared to the February 2020 report with red editing marks included.

~~Confirmation soil samples collected at and below the excavation depth confirmed that contaminants related to burn tray activities were successfully removed to below the applicable screening levels. The overall concentration of RDX in the area was reduced by soil removal which changes the overall potential for ecological risk. Also, elevated barium concentrations co-located and near the soil removal location are also reduced to about 25 feet (half the distance to the next sample location) in either direction near original sample location 4, except towards sample location 11, or less than 625 square feet. This is likely not a high enough risk level to cause a population effect. Additionally, the area is well vegetated (see photographs included in Attachment 1), there is no indication of an adverse effect at that site to plants or invertebrates. Lastly, as described in the risk assessment, there have been no observed effects for mammals and birds at the site based on various monitoring activities conducted at the site and referenced in the risk assessment (Attachment 5).~~

~~The Permittees recommend that the TA-16-399 Burn Tray (Solid Waste Management Unit 16-010(d)), be approved for clean closure and removed from the LANL Hazardous Waste Facility Permit, Attachment K, Table K-1, *SWMUs and AOCs Requiring Corrective Actions*, and added to Attachment K, Table K-3,~~

~~*SWMUs and AOCs Corrective Action Complete Without Controls* with a future permit modification request.~~

4 Certification

This section presents a signed certification of the accuracy of this report as required by 40 CFR 270.11 and a certification by an independent registered professional engineer per 40 CFR 264.115.

4.1 Certification of Accuracy

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

4.2 Independent Registered Professional Engineer's Certification

This certification was prepared in accordance with generally accepted professional engineering principles and practice pursuant to the requirements of 40 CFR §265.115, for an independent registered professional engineer's certification. These services have been performed with the care and skill ordinarily exercised by members of the profession practicing under similar conditions at the same time and in the same manner or in a similar locality. No other warranty is either expressed or implied. The finding and certification are based on 1) reviewing the NMED-approved revised closure ~~plan~~plans dated January 2019 and September 2022; 2) witnessing closure and sampling activities; and 4) reviewing the analytical results and certification report.

With the signature and seal below, I certify that, except for the variances presented in Section 2.2, the closure of the TA-16-399 Burn Tray at TA-16 was conducted in accordance with the NMED-approved revised closure plan. The information presented in this report is, to the best of my knowledge and belief, true, accurate, and complete.

Respectfully,

Pajarito Scientific Corporation

Eli V. Maestas
New Mexico Registered Professional Engineer No. 16643

Figure 2. 16-399 Soil Concentrations for Explosives above Background Values
Notes:
- All concentration values are in milligrams per kilogram (mg/kg).
- "#s" denotes that the soil sample was collected from the subsurface.
