

# Section 6

## All Calculations

---

**Show all calculations** used to determine both the hourly and annual controlled and uncontrolled emission rates. All calculations shall be performed keeping a minimum of three significant figures. Document the source of each emission factor used (if an emission rate is carried forward and not revised, then a statement to that effect is required). If identical units are being permitted and will be subject to the same operating conditions, submit calculations for only one unit and a note specifying what other units to which the calculations apply. All formulas and calculations used to calculate emissions must be submitted. The "Calculations" tab in the UA2 has been provided to allow calculations to be linked to the emissions tables. Add additional "Calc" tabs as needed. If the UA2 or other spread sheets are used, all calculation spread sheet(s) shall be submitted electronically in Microsoft Excel compatible format so that formulas and input values can be checked. Format all spread sheets and calculations such that the reviewer can follow the logic and verify the input values. Define all variables. If calculation spread sheets are not used, provide the original formulas with defined variables. Additionally, provide subsequent formulas showing the input values for each variable in the formula. All calculations, including those calculations are imbedded in the Calc tab of the UA2 portion of the application, the printed Calc tab(s), should be submitted under this section.

**Tank Flashing Calculations:** The information provided to the AQB shall include a discussion of the method used to estimate tank-flashing emissions, relative thresholds (i.e., NOI, permit, or major source (NSPS, PSD or Title V)), accuracy of the model, the input and output from simulation models and software, all calculations, documentation of any assumptions used, descriptions of sampling methods and conditions, copies of any lab sample analysis. If Hysis is used, all relevant input parameters shall be reported, including separator pressure, gas throughput, and all other relevant parameters necessary for flashing calculation.

**SSM Calculations:** It is the applicant's responsibility to provide an estimate of SSM emissions or to provide justification for not doing so. In this Section, provide emissions calculations for Startup, Shutdown, and Routine Maintenance (SSM) emissions listed in the Section 2 SSM and/or Section 22 GHG Tables and the rationale for why the others are reported as zero (or left blank in the SSM/GHG Tables). Refer to "Guidance for Submittal of Startup, Shutdown, Maintenance Emissions in Permit Applications ([http://www.env.nm.gov/aqb/permit/app\\_form.html](http://www.env.nm.gov/aqb/permit/app_form.html)) for more detailed instructions on calculating SSM emissions. If SSM emissions are greater than those reported in the Section 2, Requested Allowable Table, modeling may be required to ensure compliance with the standards whether the application is NSR or Title V. Refer to the Modeling Section of this application for more guidance on modeling requirements.

**Glycol Dehydrator Calculations:** The information provided to the AQB shall include the manufacturer's maximum design recirculation rate for the glycol pump. If GRI-Glycalc is used, the full input summary report shall be included as well as a copy of the gas analysis that was used.

**Road Calculations:** Calculate fugitive particulate emissions and enter haul road fugitives in Tables 2-A, 2-D and 2-E for:

1. If you transport raw material, process material and/or product into or out of or within the facility and have PER emissions greater than 0.5 tpy.
2. If you transport raw material, process material and/or product into or out of the facility more frequently than one round trip per day.

### Significant Figures:

**A.** All emissions standards are deemed to have at least two significant figures, but not more than three significant figures.

**B.** At least 5 significant figures shall be retained in all intermediate calculations.

**C.** In calculating emissions to determine compliance with an emission standard, the following rounding off procedures shall be used:

- (1) If the first digit to be discarded is less than the number 5, the last digit retained shall not be changed;
- (2) If the first digit discarded is greater than the number 5, or if it is the number 5 followed by at least one digit other than the number zero, the last figure retained shall be increased by one unit; **and**
- (3) If the first digit discarded is exactly the number 5, followed only by zeros, the last digit retained shall be rounded upward if it is an odd number, but no adjustment shall be made if it is an even number.
- (4) The final result of the calculation shall be expressed in the units of the standard.

**Control Devices:** In accordance with 20.2.72.203.A(3) and (8) NMAC, 20.2.70.300.D(5)(b) and (e) NMAC, and 20.2.73.200.B(7) NMAC, the permittee shall report all control devices and list each pollutant controlled by the control device regardless if the applicant takes credit for the reduction in emissions. The applicant can indicate in this section of the application if they chose to not take credit for the reduction in emission rates. For notices of intent submitted under 20.2.73 NMAC, only uncontrolled emission rates can be considered to determine applicability unless the state or federal Acts require the control. This information is necessary to determine if federally enforceable conditions are necessary for the control device, and/or if the control device produces its own regulated pollutants or increases emission rates of other pollutants.

## Uncontrolled Particulate Emission Rates

Estimates for Uncontrolled Material Handling (PM<sub>2.5</sub>, PM<sub>10</sub> and PM)

Typical composition of one cubic yard of concrete produced at the Alto Concrete Batch Plant (CBP) will be:

**Concrete Design Mix for One Cubic Yard**

Materials	Weight Per Cubic Yard (in lbs)	Weights Per 125 Cubic Yards (in ton)
Cement	489	30.6
Fly Ash	132	8.3
Water	260	16.3
Coarse Aggregate(gravel)	1900	118.8
Fine Aggregate (sand)	1100	68.8
Total	3881	242.6

Hourly raw material throughputs used in material handling emission equations are based on the tons per hour throughput.

Aggregate/Sand = 187.5 tons/hour

Cement = 30.6 tons/hour

Fly Ash = 8.3 tons/hour

To estimate material handling uncontrolled particulate emission rates for aggregate handling operations (loading storage piles, loading feeder, loading the 4-bin aggregate feeder), an emission equation was obtained from EPA's Compilation of Air Pollutant Emission Factors, Volume I: Stationary Point and Area Sources, Fifth Edition, Section 13.2.4 (1/1995), where the k is a constant (PM = 0.74, PM<sub>10</sub> = 0.35, PM<sub>2.5</sub> = 0.053). Input wind speed for maximum hourly emission rates is the NMED Default of 11 mph and input windspeed for the annual emission rates is the Ruidoso 1996 – 2006 wind speed of 8.3 mph. The moisture content for the aggregate of 1.77% and sand of 4.17% (AP-42 Section 11.12, Table 11.12-2, Footnote b). The weighted average moisture content for sand and aggregate is 2.65% ((1.77 \* 213.75 + 4.17 \* 123.75)/337.5). To estimate pre-control particulate emissions rates for aggregate handling transfer points (unloading of the feeder, loading and unloading the aggregate bin/weigh batcher), emission factors were obtained from AP-42 Section 11.19.2, Table 11.19.2-2, "Uncontrolled Conveyor Transfer Point". Uncontrolled PM<sub>2.5</sub> emission rate is based on the PM<sub>2.5</sub>/PM<sub>10</sub> k factor of 0.053/0.35 found in AP-42 Section 13.2.4 and PM<sub>10</sub> emission factor of 0.00110 lbs/ton.

To estimate uncontrolled particulate emission rates for silo loading, cement/fly ash batcher loading operations, and concrete mixer truck loading, emission equations were obtained from EPA's Compilation of Air Pollutant Emission Factors, Volume I: Stationary Point and Area Sources, Fifth Edition, Section 11.12 (06/06), Table 11.12-2. PM<sub>2.5</sub> emission factor for concrete mixer truck loading emissions were determined using the ratio of uncontrolled truck loading ratio Table 11.12-3 PM<sub>10</sub> emission factor \* PM<sub>2.5</sub>/PM<sub>10</sub> (0.05/0.278). PM<sub>2.5</sub> emission factor for cement/fly ash batcher loading emissions were determined using the ratio of uncontrolled mixer loading ratio Table 11.12-4 PM<sub>10</sub> emission factor \* PM<sub>2.5</sub>/PM<sub>10</sub> (0.38/1.92). PM<sub>2.5</sub> emission factor for cement silo emissions loading were determined using the ratio of uncontrolled mixer loading ratio Table 11.12-4 PM<sub>10</sub> emission factor \* PM<sub>2.5</sub>/PM<sub>10</sub> (0.38/1.92). PM<sub>2.5</sub> emission factor for fly ash silo emissions loading were determined using the ratio of uncontrolled mixer loading ratio Table 11.12-4 PM<sub>10</sub> emission factor \* PM<sub>2.5</sub>/PM<sub>10</sub> (0.38/1.92).

Maximum rated material throughput is 125 cubic yards per hour. Annual uncontrolled emissions in tons per year (tpy) were calculated assuming operation for 8760 hours per year.

#### **EPA's AP-42, Section 13.2-4 (01/95)**

##### **Aggregate Handling Emission Equation – Hourly Emissions**

$$E \text{ (lbs/ton)} = k \times 0.0032 \times (U/5)^{1.3} / (M/2)^{1.4}$$

$$E_{PM} \text{ (lbs/ton)} = 0.74 \times 0.0032 \times (11/5)^{1.3} / (1.77/2)^{1.4}$$

$$E_{PM10} \text{ (lbs/ton)} = 0.35 \times 0.0032 \times (11/5)^{1.3} / (1.77/2)^{1.4}$$

$$E_{PM2.5} \text{ (lbs/ton)} = 0.053 \times 0.0032 \times (11/5)^{1.3} / (1.77/2)^{1.4}$$

$$E_{PM} = 0.00783 \text{ lbs/ton}; E_{PM10} = 0.00370 \text{ lbs/ton}; E_{PM2.5} = 0.00056 \text{ lbs/ton}$$

##### **Sand Handling Emission Equation – Hourly Emissions**

$$E \text{ (lbs/ton)} = k \times 0.0032 \times (U/5)^{1.3} / (M/2)^{1.4}$$

$$E_{PM} \text{ (lbs/ton)} = 0.74 \times 0.0032 \times (11/5)^{1.3} / (4.17/2)^{1.4}$$

**Concrete Truck Loading Emission Factor**

$E_{PM} \text{ (lbs/ton)} = 1.118 \text{ lbs/ton}; E_{PM10} \text{ (lbs/ton)} = 0.31 \text{ lbs/ton}; E_{PM2.5} \text{ (lbs/ton)} = 0.0558 \text{ lbs/ton}$

**Uncontrolled Emission Factors:**

Process Unit	PM Emission Factor (lbs/ton)	PM10 Emission Factor (lbs/ton)	PM2.5 Emission Factor (lbs/ton)
Aggregate Material Handling - Hourly	0.00783	0.00370	0.00056
Sand Material Handling - Hourly	0.00236	0.00112	0.00017
Aggregate/Sand Material Handling - Hourly	0.00445	0.00211	0.00032
Aggregate Material Handling - Annually	0.00543	0.00257	0.00039
Sand Material Handling - Annually	0.00164	0.00077	0.00012
Aggregate/Sand Material Handling - Annually	0.00309	0.00146	0.00022
Aggregate Transfer Points	0.0030	0.0011	0.000167
Cement Silo	0.73	0.47	0.0930

<b>Process Unit</b>	<b>PM Emission Factor (lbs/ton)</b>	<b>PM10 Emission Factor (lbs/ton)</b>	<b>PM2.5 Emission Factor (lbs/ton)</b>
Fly Ash Silo	3.14	1.10	0.2177
Cement/Fly Ash Batcher	0.572	0.156	0.0309
Truck Loading	1.118	0.31	0.0558

The following equations were used to calculate the hourly emission rate for each process unit:

$$\text{Emission Rate (lbs/hour)} = \text{Process Rate (tons/hour)} * \text{Emission Factor (lbs/ton)}$$

The following equations was used to calculate the annual emission rate for each process unit:

$$\text{Emission Rate (tons/year)} = \frac{\text{Emission Rate (lbs/hour)} * \text{Operating Hour (hrs/year)}}{2000 \text{ lbs/ton}}$$

**Table 6-1: Pre-Controlled Material Handling Particulate Emissions (PER)**

## Estimates for Controlled Material Handling Air Pollutants (PM<sub>2.5</sub>, PM<sub>10</sub>, and PM) (PTE)

No controls will be included for Units 1, 2, or 11 with the exception on limiting annual throughput. Fugitive dust emissions from material handling sources (Units 3, 4, 5, 6) will be controlled by adding water sprays at the exit of the aggregate/sand feed hopper (EPA AP-42 control efficiency of 95.82%).

To estimate material handling control particulate emission rates for aggregate handling operations (loading storage piles, and loading feed hopper), an emission equation was obtained from EPA's Compilation of Air Pollutant Emission Factors, Volume I: Stationary Point and Area Sources, Fifth Edition, Section 13.2.4 (1/1995), where the k is a constant (PM = 0.74, PM<sub>10</sub> = 0.35, PM<sub>2.5</sub> = 0.053). Input wind speed for maximum hourly emission rates is the NMED Default of 11 mph and input windspeed for the annual emission rates is the Ruidoso 1996 – 2006 wind speed of 8.3 mph. The moisture content for the aggregate of 1.77% and sand of 4.17% (AP-42 Section 11.12, Table 11.12-2, Footnote b). The weighted average moisture content for sand and aggregate is 2.65% ((1.77 \* 213.75 + 4.17 \* 123.75)/337.5). To estimate particulate emissions rates for aggregate handling transfer points (unloading of the feeder, loading and unloading the aggregate bin/weigh batcher), emission factors were obtained from AP-42 Section 11.19.2, Table 11.19.2-2, "Conveyor Transfer Point Controlled". Additional reductions for annual emissions are found in limiting annual production.

To estimate control particulate emission rates for silo loading, cement/fly ash batcher loading operations, and concrete mixer truck loading, emission equations were obtained from EPA's Compilation of Air Pollutant Emission Factors, Volume I: Stationary Point and Area Sources, Fifth Edition, Section 11.12 (06/06), Table 11.12-2 and multiplied by the percent control efficiency of the dust collector baghouse. The dust collector baghouses will control dust to a 99.9 percent efficiency. PM<sub>2.5</sub> emission rate for concrete mixer truck loading emissions were determined using the ratio of controlled truck loading ratio Table 11.12-3 PM<sub>10</sub> lb/hr \* PM<sub>2.5</sub>/PM<sub>10</sub> (0.048/0.32). PM<sub>2.5</sub> emission rate for cement/fly ash batcher loading emissions were determined using the ratio of controlled mixer loading ratio Table 11.12-4 PM<sub>10</sub> lbs/hr \* PM<sub>2.5</sub>/PM<sub>10</sub> (0.03/0.13). PM<sub>2.5</sub> emission rate for cement silo emissions loading were determined using the ratio of controlled mixer loading ratio Table 11.12-4 PM<sub>10</sub> lbs/hr \* PM<sub>2.5</sub>/PM<sub>10</sub> (0.03/0.13). PM<sub>2.5</sub> emission rate for fly ash silo emissions loading were determined using the ratio of controlled mixer loading ratio Table 11.12-4 PM<sub>10</sub> lbs/hr \* PM<sub>2.5</sub>/PM<sub>10</sub> (0.03/0.13).

Maximum rated material throughput is 125 cubic yards per hour. Annual emissions in tons per year (tpy) were calculated assuming operation of 500,000 cubic yards per year.

### **Aggregate Handling Emission Equation – Hourly Emissions**

$$E \text{ (lbs/ton)} = k \times 0.0032 \times (U/5)^{1.3} / (M/2)^{1.4}$$

$$E_{PM} \text{ (lbs/ton)} = 0.74 \times 0.0032 \times (11/5)^{1.3} / (1.77/2)^{1.4}$$

$$E_{PM10} \text{ (lbs/ton)} = 0.35 \times 0.0032 \times (11/5)^{1.3} / (1.77/2)^{1.4}$$

$$E_{PM2.5} \text{ (lbs/ton)} = 0.053 \times 0.0032 \times (11/5)^{1.3} / (1.77/2)^{1.4}$$

$$E_{PM} = 0.00783 \text{ lbs/ton}; E_{PM10} = 0.00370 \text{ lbs/ton}; E_{PM2.5} = 0.00056 \text{ lbs/ton}$$

### **Sand Handling Emission Equation – Hourly Emissions**

$$E \text{ (lbs/ton)} = k \times 0.0032 \times (U/5)^{1.3} / (M/2)^{1.4}$$

$$E_{PM} \text{ (lbs/ton)} = 0.74 \times 0.0032 \times (11/5)^{1.3} / (4.17/2)^{1.4}$$

$$E_{PM10} \text{ (lbs/ton)} = 0.35 \times 0.0032 \times (11/5)^{1.3} / (4.17/2)^{1.4}$$

$$E_{PM2.5} \text{ (lbs/ton)} = 0.053 \times 0.0032 \times (11/5)^{1.3} / (4.17/2)^{1.4}$$

$$E_{PM} = 0.00236 \text{ lbs/ton}; E_{PM10} = 0.00112 \text{ lbs/ton}; E_{PM2.5} = 0.00017 \text{ lbs/ton}$$

**Aggregate/Sand Handling Emission Equation – Hourly Emissions**

$$E \text{ (lbs/ton)} = k \times 0.0032 \times (U/5)^{1.3} / (M/2)^{1.4}$$

Haul truck travel emissions were estimated using AP-42, Section 13.2.1 (ver.01/11) "Paved Roads" emission equation. Haul trucks will be used to deliver cement, fly ash, aggregate material, sand material, and transport concrete product. Annual emission rates are reduced by limiting the annual production which limits the number of truck per year.

**AP-42 13.1 Paved Road (01/11)**

Equation:

$$E = k(sL)^{0.91} * (W)^{1.02} * [1 - P/4N]$$

*Annual emissions only include p factor*

### Estimates for Hot Water Boiler (NO<sub>x</sub>, CO, SO<sub>2</sub>, VOC and PM)

The hot water boiler keeps the water warm during cold periods. The facility will consist of three (3) instantaneous water heaters, each rated at 199,900 Btu/hr. The combined hot water boiler is approximately 0.6 MMBtu/hr. The hot water boiler will burn natural gas with total sulfur content less than 0.75 gr/100scf and will never burn coal, wood, or any grade of fuel oil. Emission factors for NO<sub>x</sub>, CO, VOC, and PM were obtained from EPA’s Compilation of Air Pollutant Emission Factors, Volume I: Stationary Point and Area Sources, Fifth Edition, Section 1.4 (7/98), Table 1.4-1, -2. Based on a boiler Btu rating of 0.6 million and a natural gas lower heat value of 945 Btu/scf, the approximately amount of natural gas burned per hour will be 634.9 scf/hr. Uncontrolled annual emissions were based on 8760 hours per year. Controlled annual emissions were based on 8760 hours per year.

**AP-42 Section 1.4 Emission Factors:**

Pollutant	Emission Factor (lbs/10 <sup>6</sup> scf)
Nitrogen Oxides	100
Carbon Monoxides	84
Particulate	7.6
Hydrocarbons	11

$$\text{Emission Rate (lbs/hr)} = \text{Emission Factor (lbs/10}^6 \text{ scf)} * \text{Boiler Rating (10}^6 \text{ Btu/hr)}$$

**Mass Balance**

Pollutant	Sulfur Content	Fuel Usage
Sulfur Dioxide	0.75 grains/100 scf	634.9 scf/hr

$$\text{Emission Rate (lbs/hr)} = \text{grains/100 scf} * \text{Fuel Usage (100 scf/hr)} / 7000 \text{ grains/lb} * 2 \text{ S/SO}_2$$

The following equation was used to calculate the annual emission rate for each boiler pollutant:

$$\text{Emission Rate (tons/year)} = \frac{\text{Emission Rate (lbs/hour)} * \text{Operating Hour (hrs/year)}}{2000 \text{ lbs/ton}}$$

**Table 6-3: Uncontrolled Combustion Emission Rates**

<b>Emission Unit Number</b>	<b>Pollutant</b>	<b>Thermal Rating (BTU<sub>max</sub>)</b>	<b>Emission Rate (lbs/hr)</b>	<b>Emission Rate (tons/yr)</b>
