

**DEPARTMENT OF THE AIR FORCE  
377TH AIR BASE WING (AFGSC)**

*13 January 2021*

Colonel David S. Miller, USAF  
Commander  
377th Air Base Wing  
2000 Wyoming Blvd SE  
Kirtland Air Force Base New Mexico 87117

Mr. Kevin Pierard  
Hazardous Waste Bureau  
New Mexico Environment Department  
Harold Runnels Building  
1190 St. Francis Drive, Suite N2050  
Santa Fe New Mexico 87502

Dear Mr. Pierard

The U.S. Air Force (USAF) is submitting this letter with the attached Technical Memorandum regarding the bioventilation pilot (pilot) to notify the New Mexico Environment Department (NMED) that the USAF has temporarily shut down the pilot and to request NMED concurrence to permanently terminate the pilot prior to the planned shutdown date of September 2021. As detailed in the November 2017 work plan, the objective of the pilot was to evaluate the effectiveness of bioventing to support a future corrective measures evaluation of the source area and the soil vapor plume. The long-term bioventing pilot test is suitable for termination because sufficient data has been collected to evaluate feasibility of bioventilation to remediate hydrocarbons in the source area in the Corrective Measures Evaluation. This request to shut down the pilot is further supported by anomalies in soil vapor concentrations observed in the Q2 2020 and Q4 2020 soil vapor monitoring events. While elevated concentrations of ethylene dibromide and benzene do not pose a risk to human health on-Base, the USAF shut down the pilot out of an abundance of caution.

The final results of the pilot study will be presented in the Final Bioventilation Pilot Testing Report and submitted to the New Mexico Environment Department (NMED) after concurrence has been reached for permanent shutdown of the pilot test.

If you have any questions or concerns, please contact Mr. Sheen Kottkamp at commercial line 505-846-7674 or email [sheen.kottkamp.1@us.af.mil](mailto:sheen.kottkamp.1@us.af.mil).

Sincerely

DAVID S. MILLER, Colonel, USAF  
Commander

MEMORANDUM FOR New Mexico Environmental Department  
ATTENTION: Hazardous Waste Bureau

FROM: Colonel David S. Miller  
Commander  
377th Air Base Wing  
2000 Wyoming Blvd SE  
Kirtland Air Force Base, New Mexico 87117

SUBJECT: Bioventing Pilot Test November 23<sup>rd</sup> 2020 Shutdown

## **1. PURPOSE**

As discussed in the cover letter, the purpose of this technical memorandum is to notify the New Mexico Environment Department (NMED) that the United States Air Force (USAF) has temporarily shut down the bioventing pilot (pilot) test and to request NMED concurrence to permanently terminate the pilot prior to the planned shutdown date of September 2021 (after two years of pilot operation).

## **2. BACKGROUND**

Interim Measures were implemented for both groundwater and soil in accordance with Part 6.2.2.12.1 of the Resource Conservation and Recovery Act Permit NM9570024423. The interim measures for the soil consisted of the removing all soil contamination to below residential screening levels to a depth of 20 feet below ground surface and the operation of a soil vapor extraction (SVE) system. The SVE system was operated for approximately 12 years from 2003 through 2015 (USACE, 2017). It was shut down when it was determined that with only localized vapor concentrations remaining, a large volume of unimpacted air was being pulled through the SVE system. This greatly decreased the influent concentration into the system and required larger quantities of supplemental fuel (USACE, 2017). NMED approved the shutdown of the SVE system as detailed in the February 25, 2015 correspondence (NMED, 2015).

Following SVE, USAF recommended that a pilot study be performed to assess the use of bioventing at the site. This pilot study was performed to assess the potential effectiveness of this technology at the site and provide data for an assessment of bioventing as a remedial strategy to treat soil vapors at within the Corrective Measures Evaluation (CME).

The bioventing pilot test was performed to evaluate the feasibility of this technology to remediate petroleum hydrocarbon concentrations remaining in the vadose zone after soil interim measures were performed. The effectiveness of bioventing was performed by measuring the microbial oxygen utilization rate in the subsurface. The rate of oxygen utilization is directly proportional to the aerobic biodegradation rate of fuel hydrocarbons in the subsurface and is therefore an indication of effectiveness of bioventing to achieve site cleanup in a timely manner. Because soil moisture content is also an important factor in the microbe's ability to degrade hydrocarbons the pilot study included the injection of water into the subsurface to assess the effectiveness of this method to assist with increasing the subsurface moisture content.

The bioventing pilot test is being performed in accordance with the Bioventing Respiration Pilot Testing Procedure (Kirtland AFB, 2018) and the Work Plan for Bioventing and Air-Lift Enhanced Bioremediation Pilot Tests, dated November 2017 (Work Plan [Kirtland AFB, 2017]). These documents were approved by the NMED in letters dated February 25, 2019 (New Mexico Environment Department [NMED], 2019) and April 6, 2018 (NMED, 2018), respectively. The bioventing area and well locations are shown on Figure 1 (Attachment 1).

The bioventing blowers were operated continuously for approximately 1 year between the fourth quarter (Q4) 2019 and the third quarter (Q3) 2020. Bioventing was conducted in both dry and moisture added (wet) conditions, water injection was performed at wells SVMW-10-100, SVMW-10-150, SVMW-10-250, SVMW-11-100, SVMW-11-250, and SVMW-11-260 at the beginning of the second quarter (Q2), Q3, and Q4 2020. Field parameters collected throughout the first year of bioventing are provided in Tables 1 through 12 (Attachment 2). Oxygen utilization rates and corresponding biodegradation rates were calculated using the obtained field parameters.

### **3. EVALUATION OF BIOVENTING PILOT DATA TO DATE**

Operation of the bioventing pilot test began without the introduction of moisture. Dry bioventing was performed for Q4 2019 and the first quarter (Q1) 2020 of the pilot study. However, the data during these quarters did not indicate significant biodegradation and water was added in subsequent quarters (Q2 and Q3 2020).

During pilot testing, data to estimate oxygen utilization and biodegradation rates were collected. The calculated oxygen utilization and corresponding biodegradation rates for each quarter are presented in Table 13 (Attachment 2). The site-wide average oxygen utilization rate decreased from 0.17 percent (%) per day in Q4 2019 to 0.09% per day in Q3 2020 and has generally decreased through the first year of the bioventing pilot test. When comparing soil vapor relative humidity data from Q4 2019 and Q1 2020 to Q2 and Q3 2020, the relative humidity does not appear to have increased after the addition of moisture, indicating that moisture addition method specified in the approved work plan was not effective at increasing subsurface humidity (Tables 1 through 12, Attachment 2).

Oxygen utilization and biodegradation rate trends for each monitoring point are shown on the graphs provided in Attachments 3 and 4. The site-wide average oxygen utilization rate has varied between 0.08 and 0.18% per day while the biodegradation rate has varied between 0.05 and 0.10 milligrams per kilogram per day Table 13 (Attachment 2).

Operation of the bioventing system has been continuous throughout the first year of long-term bioventing. Sufficient oxygen was being supplied to the subsurface as is evident by elevated oxygen concentration observed throughout all of the monitoring points (Attachment 2, Tables 1-12). However, oxygen utilization rates remained low and appears to have stabilized over the first year of long-term bioventing averaging approximately 0.1 % per day over the final 3 quarters of operation. This average oxygen utilization rate was approximately one order of magnitude below the 1% per day utilization rate determined by Leeson and Hinchee, 1996, to demonstrate the feasibility of bioventing technology as a final remedy.

The data collected during the bioventing pilot test will be summarized in a final report and used during the vadose zone remedy evaluation in the CME.

#### **4. OPERATIONAL CONCERNS**

Soil vapor concentration anomalies were observed in Q2 and Q4 2020 in the immediate vicinity of the bioventing pilot testing area. The anomalies included benzene and ethylene dibromide soil vapor concentrations that were elevated as compared to historical values in 16 SVMP located on base and around the bioventing system (see the list of SVMPs provided in Figure 2 in Attachment 1 and Table 14 in Attachment 2). The concentration increases occurred within the Kirtland AFB boundary and at depths of 50 feet below ground surface or deeper.

Elevated soil vapor benzene concentrations were observed within multiple wells located radially surrounding the bioventing system at significant distances varying from the bioventing testing area. The most likely cause of the anomalies is that soil vapors are migrating radially away from the bioventing testing area by continued operation of the bioventing system. This advection of soil vapor, coupled with low oxygen utilization/biodegradation and the observed anomalies, suggests that migration and not degradation of the soil vapor concentrations is occurring.

The majority of these anomalies were located adjacent to the bioventing testing area. The reported anomalies were generally observed at depths closely associated with the injection intervals (air injection was performed at depths of 100, 105, 160, 250, 260, and 313 ft bgs). All observed anomalies occurred at depths of 50 ft below ground surface (bgs) or deeper, except for the one anomaly observed at KAFB-106118-025. Based on the observed bioventing data there does not appear to be a vapor migration risk for on-Base receptors under the industrial land use scenario. No off-base vapor migration was measured.

Due to the potential of soil vapor migration resulting from continuous bioventing operations, the bioventing system was shut down on November 23, 2020. This Technical Memorandum was prepared and submitted after the anomalous data was validated as part of the routine Q4 2020 monitoring event. All soil vapor monitoring analytical data and validation of that data will be discussed within the Q4 2020 monitoring report.

#### **5. CONCLUSIONS AND RECOMMENDATIONS**

Given the length of the bioventing pilot study operation (1 year) and the operation of the system in both dry and wet modes, it is unlikely that additional operation of the bioventing system under current conditions will yield any new information regarding this technology. These results combined with the migration of soil vapors that appears to be caused by the operation of the pilot, the Air Force requests approval from NMED to conclude the pilot. The final results of the pilot study would then be submitted to NMED after concurrence has been reached for the termination of the pilot test. The Air Force would still appreciate the opportunity to meet with NMED in the near future to discuss the notice of deficiency on the Bioventilation Construction and Initiation Report (NMED, 2020) and this request to terminate the pilot.

Abnormally high concentration compared to historical.

ppbv = parts per billion by volume

Q1 = first quarter

Q2 = second quarter

Q3 = third quarter

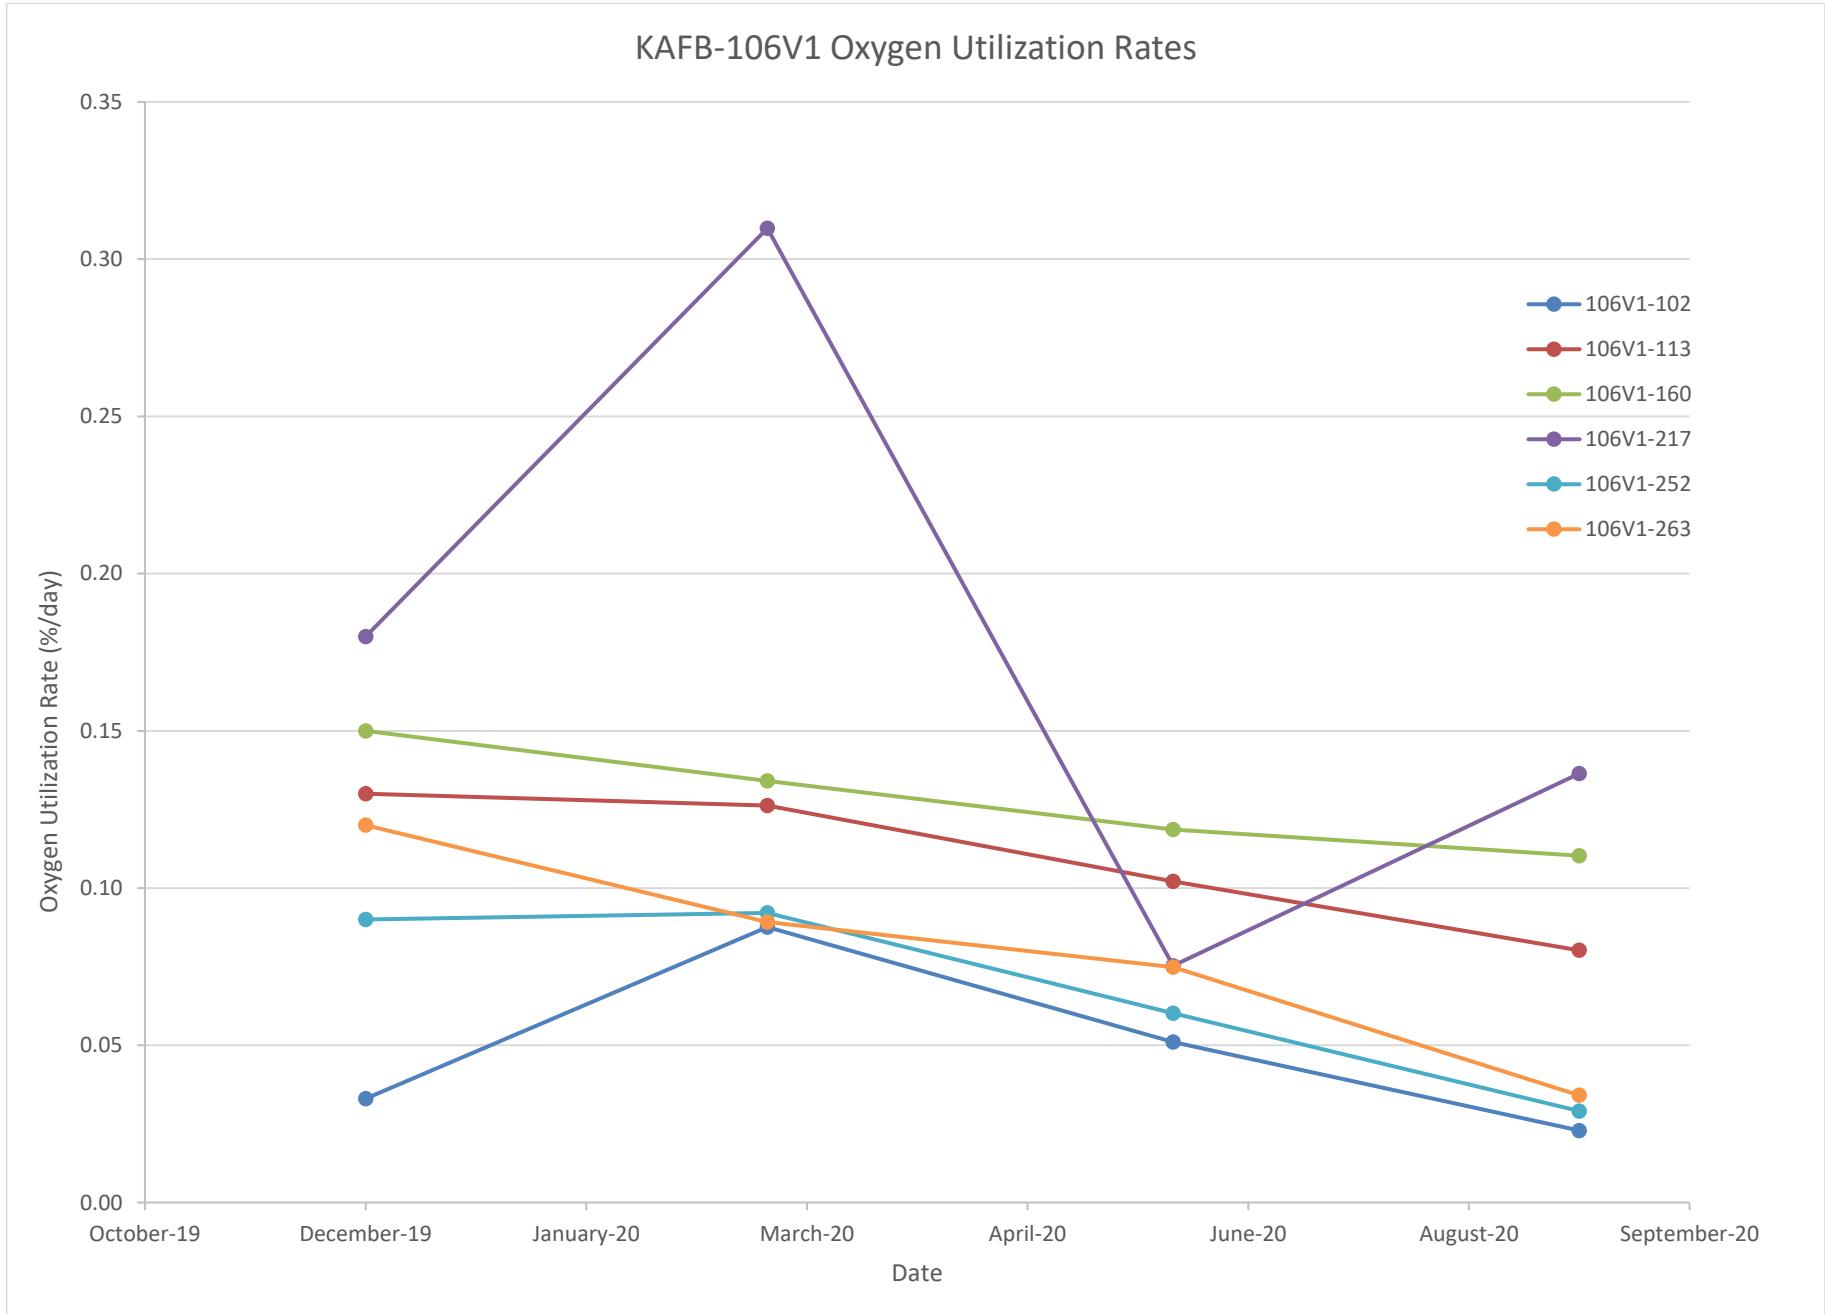

Q4 = fourth quarter

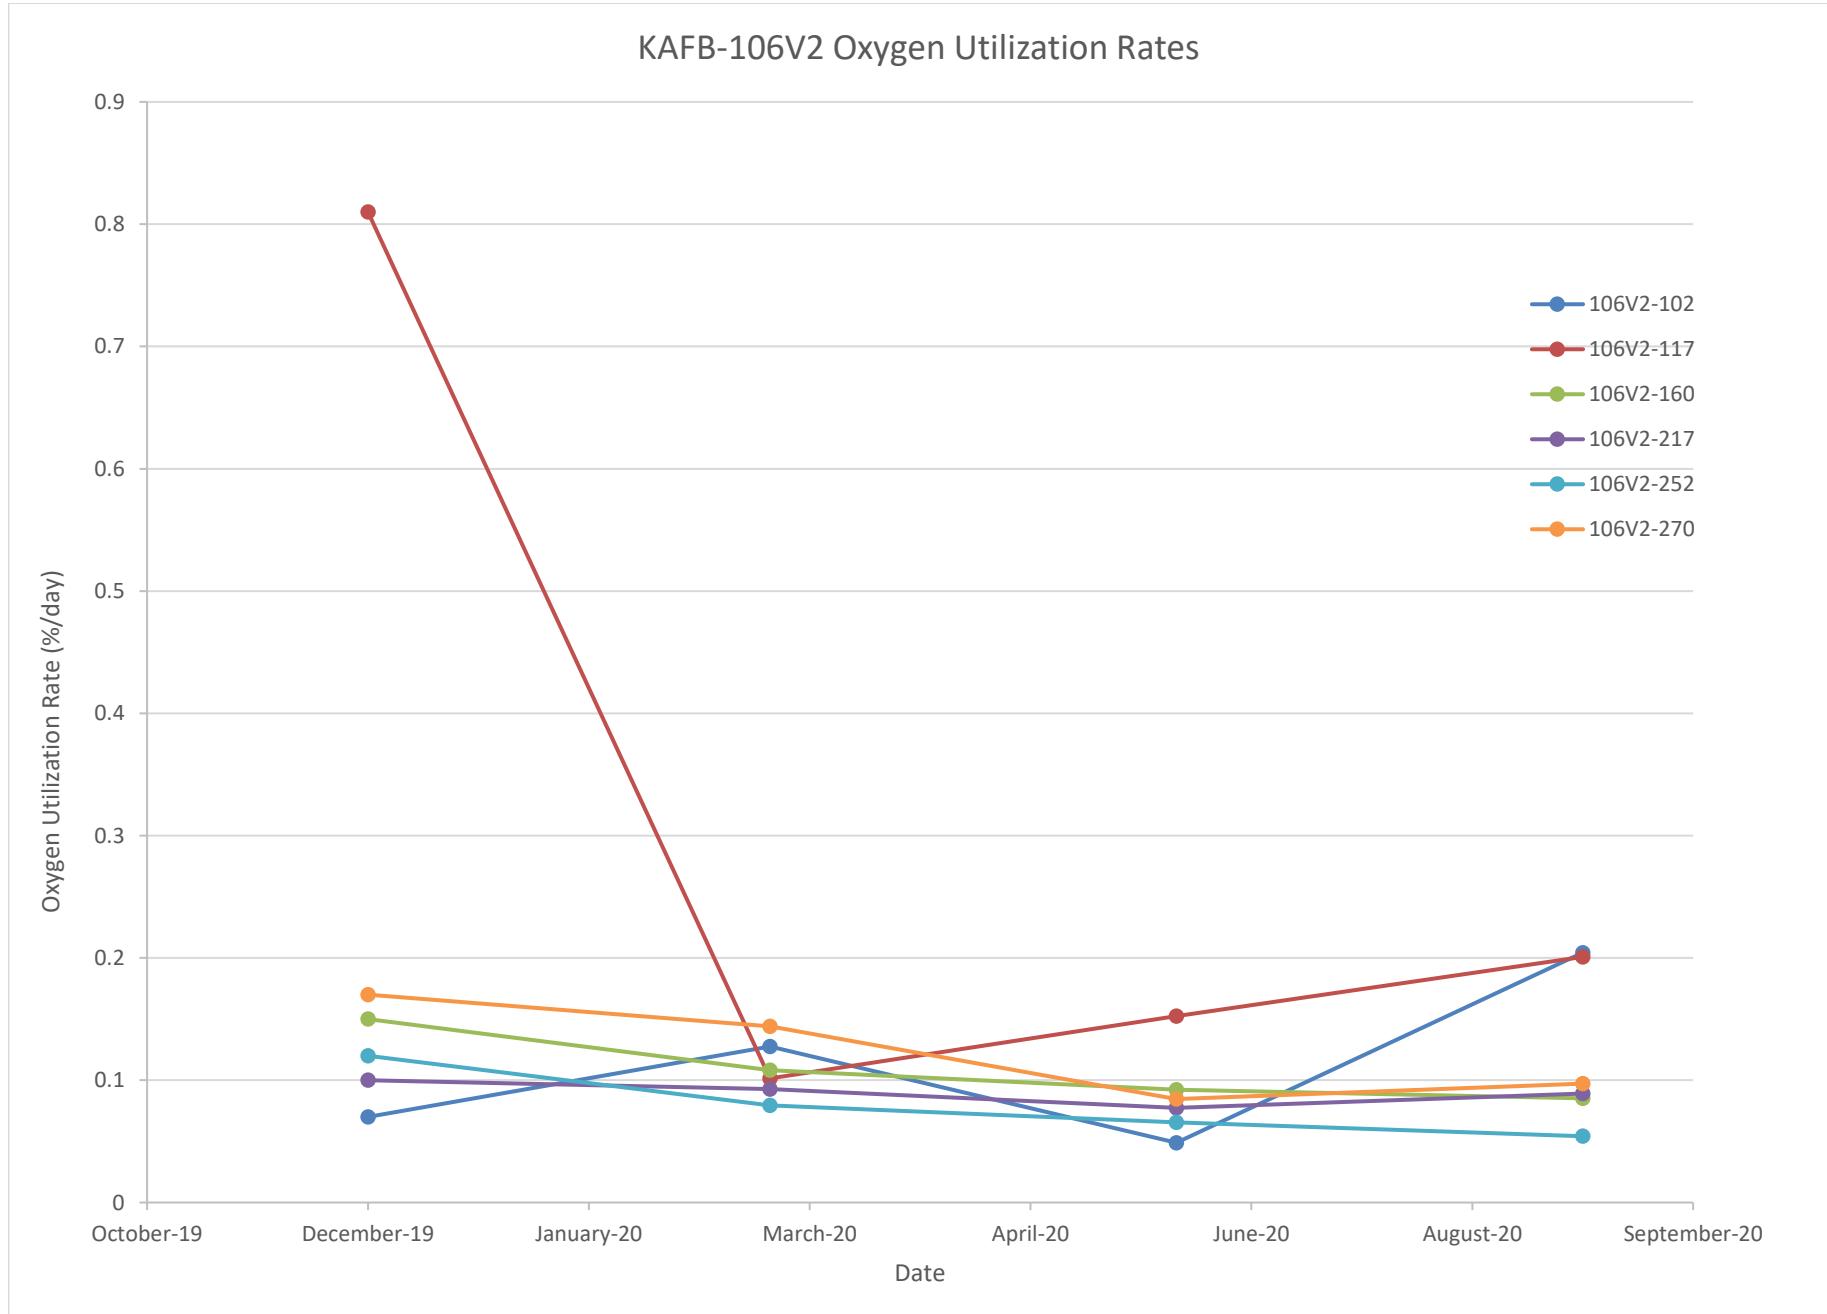

J = Qualifier denotes the analyte was positively identified, but the associated numerical value is estimated.

U = Qualifier denotes the analyte was analyzed but not detected above the detection limit. The value associated with the U-qualifier is the limit of detection.
