Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Katherine Aaron

Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Dene Canon

Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Linda Frisone

Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Megan Holden

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Roger Kulp

Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would be an embarrassing failure to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is absolutely critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable, unacceptable, and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future. We must not behave as if the foxes are guarding the henhouse.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

ALSO, please do not move forward with rules for using produced water for anything other than on-site in the extraction process. Reliable studies NOT FUNDED by oil & gas interests prove that toxic by-products in such water, including "NORMS" cannot be removed from such water. Companies have no right to take the fresh water New Mexico desperately needs, contaminate it, then sell it back to us for use in agriculture or for drinking. The costly harm to our people must be taken into consideration. I expect more from Michelle Lujan Grisham's government

and hold you all accountable for the painful long term consequences of inaction in this area.

Sincerely,
Diane MacInnes

Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Les McDaniel

Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Marilyn OBoyle

Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Peter Roche

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Roxane Spaulding

Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

Subject: [EXT] Please address major flaws in the NMED draft oil & gas air pollution rule

Dear Secretary Jim Kenney,

I voted for Governor Lujan Grisham to support real environmental protections, not weak ones. I agree with the following:

New Mexico needs to strengthen its proposed rule to cut ozone-forming volatile organic compounds (VOCs) from the oil & gas industry. This current draft would fail to protect the health of New Mexico families, our air, and our climate.

According to an EDF analysis, more than 300,000 metric tons of VOCs are emitted annually from oil and gas sites across the state. Ozone or smog can worsen respiratory diseases and cause heart disease posing particular threats to children and the elderly. Moreover, the Centers for Disease Control warns that people with these underlying health conditions are most at risk for serious complications and adverse outcomes from COVID-19.

The five New Mexico counties home to 97 percent of the state's oil and gas wells – including San Juan, Eddy, Lea and Rio Arriba counties – are all at risk of violating federal ozone standards.

Methane emissions are also released alongside volatile organic compounds. Methane is a powerful greenhouse gas responsible for a quarter of the climate change we are experiencing today. This means longer, hotter summers for New Mexico which will exacerbate New Mexico's ozone pollution problem. While cutting methane is an important co-benefit for our climate, it will also have a direct affect on addressing ozone in the state of New Mexico.

That is why it is critical that exemptions for stripper wells and the 15 tons per year pollution threshold for volatile organic compounds be removed. These two exemptions combined would exempt 95% of all wells in New Mexico. This is unacceptable and falls far below Governor Michelle Lujan Grisham's goal of establishing nationally leading methane rules in New Mexico.

In addition, please extend leak detection and repair requirements to include pneumatic devices, consider requirements for zero emission pneumatics and consider monthly inspections for high producing well sites just as Colorado has adopted.

Our families and communities are counting on NMED to put forward a strong, final rule that protects our health and our future.

Sincerely,
Steven Yanoff
