Deputy Secretary

**Groundwater Monitoring at Sandia National Laboratories/New Mexico Burn Site  
Conducted by NMED DOE OB for FFY 2009 Q-4**

The New Mexico Environment Department (NMED) DOE Oversight Bureau (Bureau) has compiled and assessed groundwater data collected in September 2009. The Bureau collected groundwater samples from Burn Site groundwater monitoring wells CYN-MW3, CYN-MW4, and CYN-MW6. Split samples were collected using standard Sandia National Laboratories/ New Mexico (SNL/NM or Sandia) sampling procedures and equipment. Bureau samples were submitted to an independent analytical laboratory for metals, inorganics, radionuclides and organics analyses. Corrected gross alpha (total gross alpha activity excluding total uranium activity) was detected above the EPA MCL of 15 pCi/L at monitoring well CYN-MW4. Nitrate plus nitrite (NPN) was also detected above the EPA MCL of 10 mg/L at monitoring wells CYN-MW3 and CYN-MW6.

**Data Assessment**

All groundwater samples were collected and analyzed in accordance with U.S. Environmental Protection Agency (EPA) protocols. Data results are compared to applicable Maximum Allowable Concentrations (MACs) from the New Mexico Water Quality Control Commission (WQCC) (20.6.2.3103A NMAC Human Health Standards) and Maximum Contaminant Levels (MCLs) from the EPA National Primary Drinking Water Regulations (40 CFR 141).

**Results**

Analytical results for total metals are listed in Table 1. Samples were analyzed for total (unfiltered) target analyte list (TAL) metals plus uranium. All metals concentrations were below established MCLs.

Analytical results for non-metal inorganics are listed in Table 2. Samples were analyzed for major anions (bromide, chloride, fluoride and sulfate) and nitrate plus nitrite (NPN). All major anions were detected below established MCLs. Nitrate plus nitrite was detected above the MCL of 10 mg/L at monitoring wells CYN-MW3 and CYN-MW6. Concentrations were 11 mg/L and 39 mg/L, respectively.

Analytical results for radionuclides are listed in Table 3. Samples were analyzed for gamma-emitting isotopes and gross alpha and beta. All radionuclide activities were below MCLs, except for gross alpha in monitoring wells CYN-MW4 and CYN-MW6. Corrected gross alpha values

were obtained by subtracting the total uranium alpha contribution, as shown in the table below. When the total uranium activity was subtracted from the uncorrected gross alpha, CYN-MW4 exceeded the MCL of 15 pCi/L. Corrected gross alpha at CYN-MW6 was below the MCL.

#### Gross Alpha Correction

Well Name	Uncorrected Gross Alpha Activity (pCi/L)	Total Uranium Concentration ( $\mu\text{g}/\text{L}$ )	Total Uranium Activity <sup>a</sup> (pCi/L)	Corrected Gross Alpha Activity (pCi/L)
CYN-MW4	30	13	11.7	18.3
CYN-MW6	15	11	9.9	5.1
CYN-MW6*	16	11	9.9	6.1

<sup>a</sup> Total Uranium activity is obtained by multiplying total uranium concentration by 0.9 pCi/ $\mu\text{g}$  (40 CFR Parts 9, 141, 142 National Primary Drinking Water Regulations, Radionuclides; Final Rule)

\* Unflamed

Analytical results for organic compounds detected above their method detection limits (MDLs) are listed in Table 4. Samples were analyzed for diesel range organics, gasoline range organics and volatile organic compounds. Constituents detected above their associated method detection limit were below established MCLs.

#### Conclusions

When analytical data are received from Sandia for this sampling event, Bureau staff will compare results for verification.

Nitrate concentrations exceeded the MCL of 10 mg/L at monitoring wells CYN-MW3 and CYN-MW6 during this sampling event. Concentrations at CYN-MW3 compare well with historical Sandia data. Based on this historical trend, NPN concentrations at CYN-MW3 have been steady to slightly decreasing over time (Figure 1). Nitrate concentrations from CYN-MW6 have consistently exceeded the MCL of 10 mg/L. The Bureau NPN data from CYN-MW6 show a strong increase over the years and concentrations have been slightly higher than those indicated from the Sandia data. Historical data from Sandia (2006-2008) indicate NPN concentrations have been steady to slightly increasing over time. The Bureau also included a trend line that combines both NMED and SNL data (Figure 2). The combined data set shows NPN concentrations have been increasing at CYN-MW6.

Gross alpha activity from CYN-MW4 exceeded the MCL of 15 pCi/L. Results obtained by NMED compare well to historical Sandia gross alpha activities (Figure 3).

#### Response

Questions or comments should be addressed to Chris Armijo by phone at (505) 383-2070, by e-mail at [chris.armijo1@state.nm.us](mailto:chris.armijo1@state.nm.us), or to the address in the letterhead.

Notes:

- J Activity is an estimated value
- LT Result is less than requested MDC but greater than sample specific MDC.
- M The requested MDC not met.
- M3 The requested MDC was not met, but the reported activity is greater than the reported MDC.
- TI Gamma: Nuclide identification is tentative.
- U Result is less than the sample specific MDC.
