**Groundwater Monitoring at Sandia National Laboratories/New Mexico
Burn Site Groundwater Conducted by the New Mexico Environment Department
DOE Oversight Bureau for FFY 2012 Q-3**

The New Mexico Environment Department (NMED) DOE Oversight Bureau (DOE-OB or Bureau) has compiled and assessed groundwater data collected during April 2012. The Bureau collected groundwater samples from Burn Site Groundwater monitoring wells CYN-MW4, CYN-MW6, CYN-MW7, CYN-MW8, CYN-MW9, CYN-MW10, CYN-MW11 and CYN-MW12. Split samples were collected using standard Sandia National Laboratories/New Mexico (SNL/NM) sampling equipment and procedures. The samples were submitted to an independent analytical laboratory where they were analyzed for organics, metals, general chemistry and radiochemistry. Several samples analyzed for nitrate-nitrite were detected above the EPA MCL of 10 mg/L.

Data Assessment

Data results are compared to applicable Maximum Contaminant Levels (MCLs) established by the U.S. Environmental Protection Agency (EPA) National Primary Drinking Water Regulations (40 CFR 141), National Primary Drinking Water Standards, EPA, July 2002. Perchlorate results are compared to the *Compliance Order on Consent (COOC) Pursuant to the New Mexico Hazardous Waste Act 74-4-10: Sandia National Laboratories Consent Order*, New Mexico Environment Department, April 19, 2004.

Results

Analytical results for Target Analyte List (TAL) metals are presented in Table-1. Samples were analyzed for total TAL metals plus uranium. All metal concentrations were detected below established EPA MCLs.

Analytical results for anions (bromide, chloride, fluoride and sulfate), nitrate-nitrite and perchlorate are presented in Table-2. No anions were detected above established EPA MCLs. Nitrate concentrations were detected above the EPA MCL of 10 mg/L at monitoring wells CYN-MW6 (20.2 mg/L), CYN-MW9 (31.5 mg/L) and CYN-MW12 (13 mg/L). Perchlorate was analyzed from samples collected at CYN-MW6 only. The perchlorate concentration from CYN-MW6 was 5.8 µg/L. Currently, no MCL exists for perchlorate. However, the concentration exceeds the NMED COOC screening level of 4 µg/L.

Analytical results for high explosives (HE) are listed in Table-3. Samples were analyzed for HE compounds at monitoring wells CYN-MW9, CYN-MW10, CYN-MW11 and CYN-MW12. No compounds were detected above the laboratory method detection limit (MDL).

No volatile organic compounds (VOC) or semi-volatile organic compounds (SVOC) were detected above the MDLs. Associated laboratory MDLs and analytical methods for VOCs and SVOCs are presented in Table-4 and Table-5, respectively.

Analytical results for total petroleum hydrocarbons (TPH) are listed for diesel range organics (DRO) and gasoline range organics (GRO) in Table-6. The sample taken from monitoring well CYN-MW6 detected TPH DRO. The concentration was detected equal to the laboratory MDL, but below the practical quantitation limit (PQL). As a result, the value reported by the laboratory was qualified with "J" as an estimated concentration.

Radiochemistry results are listed in Table-7. Samples were analyzed for gross alpha, gross beta, gamma emitting isotopes, isotopic uranium and tritium. Unadjusted gross alpha activity ranged from 7.11 ± 3.4 pCi/L at CYN-MW11 to 43 ± 11 pCi/L at CYN-MW4. The EPA MCL for gross alpha activity of 15 pCi/L is based on a corrected gross alpha value, which excludes both total uranium and radon from initial gross alpha count. When the total uranium activity was subtracted from the gross alpha value, the gross activity was below the MCL. No tritium samples were detected above the minimum detectable activity (MDA). All other gamma emitters were detected below established MCLs.
