DOE Oversight Bureau, New Mexico Environment Department

Direct Penetrating Radiation Monitoring Report at the Waste Isolation Pilot Plant

Conducted by the
New Mexico Environment Department DOE Oversight Bureau
for Calendar Year 2017 Q-2

Prepared by
Andrea K. Goodbar, Environmental Scientist

WIPP Oversight Section
406 N Guadalupe Street
Carlsbad, NM 88220

Final Report

5/25/2018

The purpose of this communication is to transmit direct penetrating radiation (DPR) dose levels collected at the Waste Isolation Pilot Plant during the second quarter of calendar year 2017. The data measurements were obtained using the E-PERM® electret ionization chamber system from Rad Elec Inc.

Introduction

The U.S. Department of Energy (DOE) has provided grant funding to the New Mexico Environment Department (NMED) DOE Oversight Bureau (DOE-OB or the Bureau) to conduct environmental surveillance and monitoring at the Waste Isolation Pilot Plant (WIPP) since 2005. Monitoring programs include ambient air sampling, exhaust air sampling, general environmental sampling and measuring direct penetrating radiation.

The purpose of the Direct Penetrating Radiation (DPR) Monitoring Program is to monitor gamma radiation (or direct penetrating radiation) at the WIPP facility, in the area immediately surrounding, and along the local WIPP transportation routes.

There are no Federal or State standards for gamma radiation in the environment. To verify that activities at the WIPP are protective of public health and the environment, the NMED WIPP Oversight Section (WOS) gamma radiation dosage results are compared to average naturally occurring background gamma radiation dosages and with historical NMED DPR data.

On average, Americans receive a radiation dose of about 620 mrem each year. Half of this dose (310 mrem) comes from natural background radiation: radon in the air, cosmic rays and the Earth itself. The other half comes from man-made sources of radiation: medical, commercial, and industrial sources (Doses in our Daily Lives, U.S. Nuclear Regulatory Commission website http://www.nrc.gov/about-nrc/radiation/around-us/doses-daily-lives.html, accessed August 4, 2017).

The environmental dose standard for the WIPP facility is established in Title 40 Code of Federal Regulations (CFR) Part 191, Subpart A, “Environmental Standards for Management and Storage.” The standard sets the regulatory limit for external radiation to a member of the public outside the exclusive use area boundary at 25 mrem per year to the whole body and 75 mrem to any critical organ.

In a 1995 memorandum of understanding between the U.S. Environmental Protection Agency (EPA) and the U.S. Department of Energy (DOE), the DOE agreed that the WIPP facility would comply with 40 CFR Part 61, Subpart H, “National Emission Standards for Emissions of Radionuclides Other Than Radon from Department of Energy Facilities.” The NESHAP standard for radionuclides requires that the emissions of radionuclides to the ambient air from DOE facilities shall not exceed those amounts that would cause any member of the public to receive in any year an effective dose equivalent (EDE) of 10 mrem per year. (US Environmental Protection Agency 1995)

The NMED WOS has measured and compiled DPR dose levels at NMED DOE OB monitoring sites during the second quarter (Q-2) of the calendar year (CY) 2017. During CY2017, the DOE OB maintained a total of fourteen (14) monitoring sites located in the Exclusive Use Area at WIPP and ten (10) sites at off-site locations in the region surrounding WIPP. DPR dose data are collected quarterly. (See Table 1, Figure 1; Appendix 1).

[1] Monitoring at DPR 15 was discontinued after CY2012 Q-2 when NMED moved their office from the Canal Street location to 406 N Guadalupe Street.
[2] Monitoring at DPR 17a was completed for Q-3 CY 2007 then discontinued.

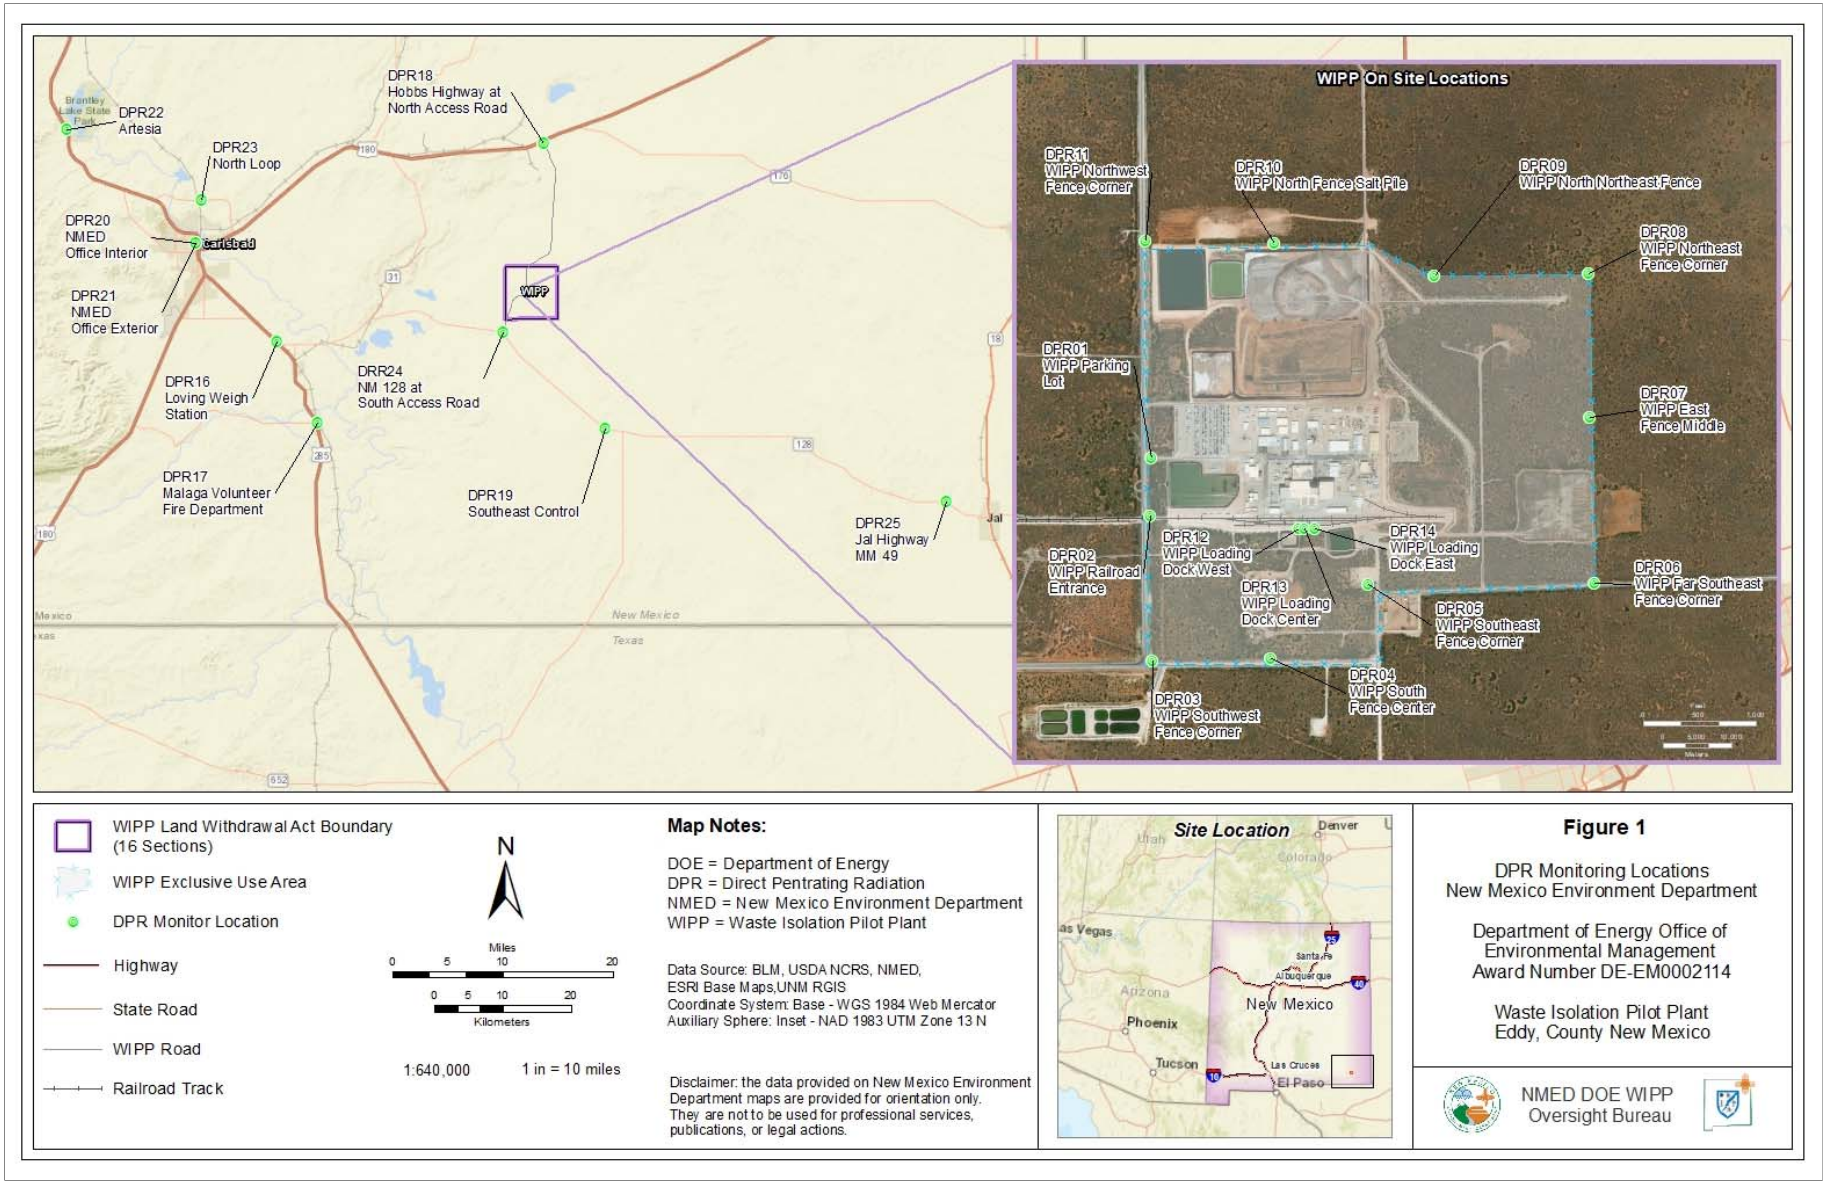

Figure 1. Location of NMED DOE-OB DPR monitors at WIPP and in the area surrounding WIPP

The data were obtained using the E-PERM® electret ionization chamber system from Rad Elec Inc. The electret passive ion chamber uses the principle of ion pair production resulting from gamma photons interacting with air molecules to reduce the voltage of a charged Teflon™ disk. (Rad Elec Inc. 2011) The chambers are housed in aluminum canisters designed to block gamma radiation from radon. Using a predetermined formula, the voltage drop indicates the amount of radiation passing through the chamber. (Rad Elec Inc. 2011) The WOS monitoring program reads electret passive ion chambers at the end of each quarter, readings are converted into quarterly dose values presented in units of millirads (mrad).

A rad is a unit of absorbed radiation dose, regardless of its source. The rem (Roentgen equivalent man) is a commonly used unit of ionizing radiation dose that uses a quality factor based on the source of radiation as it interacts with human body tissue. In the case of gamma radiation, the quality factor is one, and thus one rad is equal to one rem.

The quarterly dose rates have been normalized to reflect an actual quarter of 91.25 days. Normalized quarterly dose rates are summed for an estimated annual dose rate.

Results

The complete data set for Q-2 is presented in Appendix 1. Average quarterly dose measured at each station during Q-2 is provided in Table 2, Figures 2 and 3. The average quarterly dose of all DPR monitoring locations was 26.7 ± 7.6 standard deviation (SD).

DPR results at the WIPP ranged from a minimum average quarterly dose of 20.6 mrad at the WIPP Railroad Entrance (DPR02), to a maximum average quarterly dose of 28.7 mrad at the North-Northeast Fence Corner (DPR09). The average of all measurements at the WIPP site during Q-2 was 24.3 mrad ± 2.3 SD.

DPR results off-site ranged from a minimum average quarterly dose of 22.6 mrad at the Carlsbad NMED Office Exterior (DPR 21), to a maximum average quarterly dose of 60.3 mrad at the Jal Highway (DPR 25). The average of all measurements off-site was 30.1 mrad ± 10.8 SD.

A review of the historical DPR data collected at WIPP and in the surrounding region identified several potential outliers in the dataset. In these instances, one of the three electrets at a location had a voltage drop that was significantly higher or lower than the other electrets. Potential outliers were compared to the quarterly average across all stations, and data that exceeded 2 and 3 SD from the mean are identified in Table 2. Potential outliers have not been excluded from the results reported or analyzed.

Table 2. NMED DOE OB DPR Results for CY2017 Q-2, Average Quarterly Dose (mrad). One asterisk (*) indicates that one of the three electrets' calculated dose exceeds two SD of the mean quarterly average for all stations without a disqualifying event listed in the field notes. Two asterisks (**) indicates that one of three electrets' calculated dose exceeds three SD of the mean quarterly average for all stations without a disqualifying event in the field notes.

DPR Number	Location Name	2017 Q-2 Average Dose (mrad)

DPR 25	Jal Highway MM49	60.3**

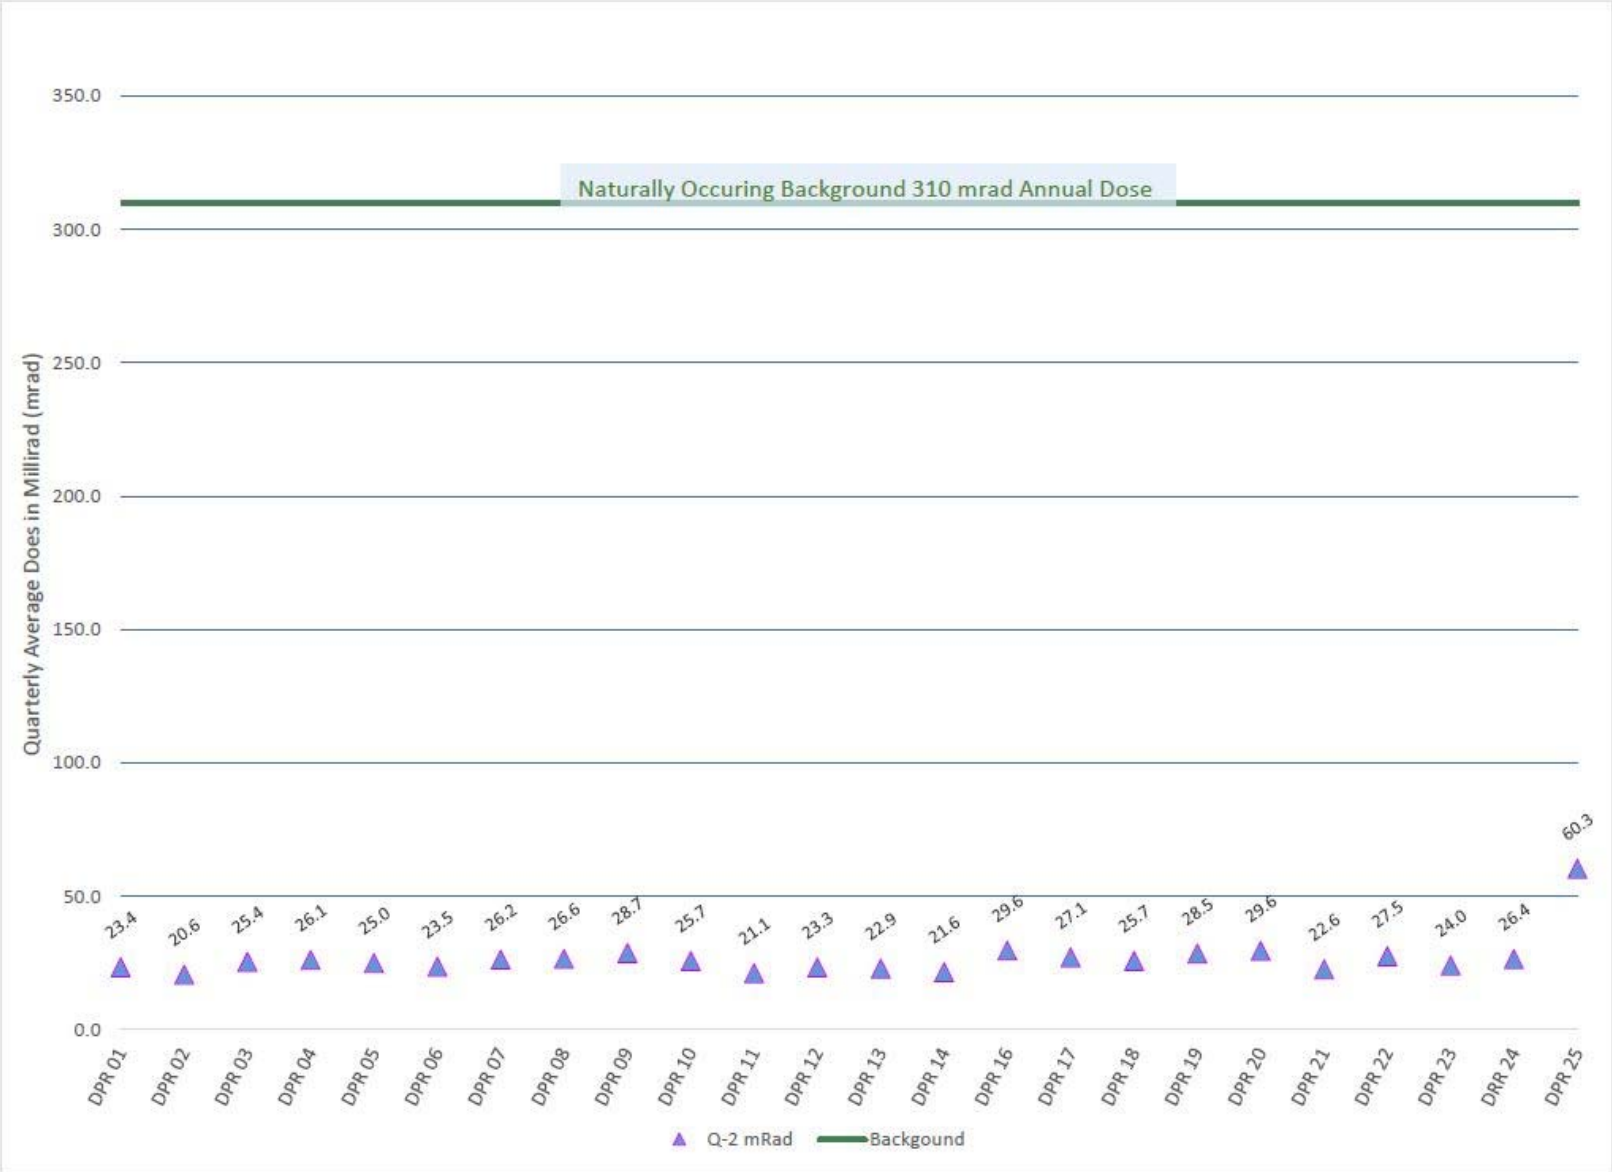

Figure 2. NMED DOE-OB DPR Results for CY2017 Q-2, Average Quarterly Dose (mrad)

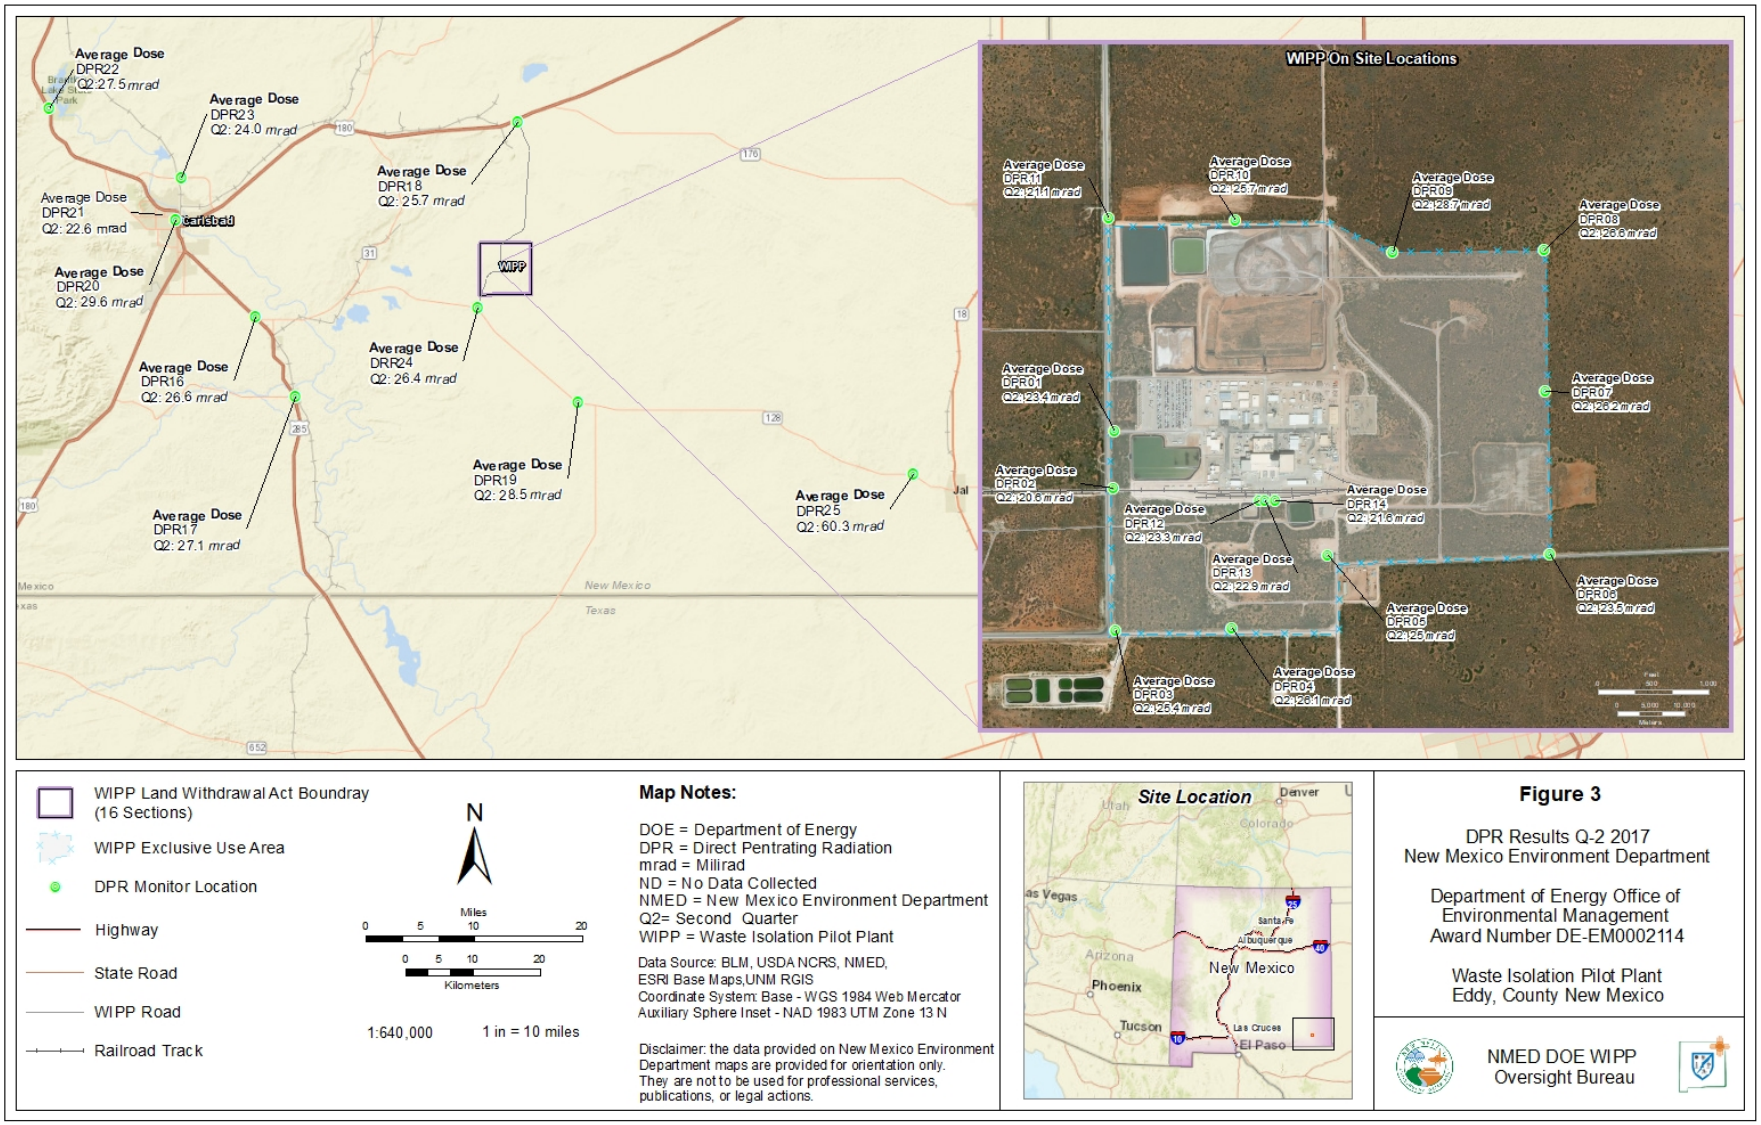

Figure 3. NMED DOE-OB DPR Results for CY2017 Q-2, Average Quarterly Dose (mrad) mapped by sampling location

Conclusions

The doses calculated from the NMED DOE-OB DPR sites located at WIPP and in the surrounding region during CY 2017 Q-2 are comparable with historical results obtained by the Bureau since 2006. Overall the 2017 Q-2 data fall within the range of expected doses.

The average quarterly DPR dosages for Q-2 measured by the NMED DOE-OB at WIPP and in the region surrounding Carlsbad range from 20.6 to 60.3 mrad. If you extrapolate these quarterly doses for an entire year, the annual DPR dosages would range from 82.4 to 241.2 mrad. In the case of gamma radiation, the quality factor is one, and thus one rad is equal to one rem. These observed dose rates are less than the average U.S. natural background annual dose of 310 mrem which is the equivalent to 310 mrad.
