**Groundwater Monitoring at Sandia National Laboratories/New Mexico GWPP
Conducted by NMED DOE OB for FFY 2011 Q-2**

The New Mexico Environment Department (NMED) DOE Oversight Bureau (Bureau) has compiled and assessed groundwater data collected during March 2011. The Bureau collected groundwater samples from Groundwater Protection Program (GWPP) monitoring wells CTF-MW2 and CTF-MW3. Samples were also collected from Coyote Springs located in Arroyo del Coyote. Split samples were collected using standard Sandia National Laboratories/New Mexico (SNL/NM) sampling procedures and equipment. The samples were submitted for analysis to an independent analytical laboratory for Target Analyte List (TAL) metals plus uranium, anions, nitrate- nitrite as nitrogen (NPN), perchlorate, cyanide, volatile organic compounds (VOCs), high explosives (HE), gamma emitting isotopes, gross alpha and beta, radium 226 and 228, and isotopic uranium. Elevated concentrations of arsenic, beryllium, RDX, and radium 226 and 228 were noted in several samples.

Data Assessment

All groundwater samples were collected and analyzed in accordance with U.S. Environmental Protection Agency (EPA) protocols. Data results are compared to applicable Maximum Contaminant Levels (MCLs) from the EPA National Primary Drinking Water Regulations (40 CFR 141).

Currently there is no U.S. EPA National Primary Drinking Water MCL or State of New Mexico drinking water standard for perchlorate. However, perchlorate results are compared to the *Compliance Order on Consent (COOC) Pursuant to the New Mexico Hazardous Waste Act 74-4-10: Sandia National Laboratories Consent Order*, New Mexico Environment Department, April 19, 2004.

Results

Analytical results for Target Analyte List (TAL) metals are presented in Table-1. Samples were analyzed for dissolved metals plus uranium and total mercury. No metal parameters were detected above established regulatory standards, except for arsenic and beryllium. Arsenic was detected above the EPA MCL of 0.01 mg/L at CTF-MW2 at a concentration 0.053 mg/L. Beryllium was detected above the MCL of 0.004 mg/L in Coyote Springs at a concentration of 0.0073 mg/L.

Analytical results for inorganic compounds are listed in Table-2. Samples were analyzed for anions (bromide, chloride, fluoride and sulfate), nitrate-nitrite as nitrogen, perchlorate and total cyanide. No samples exceeded their associated MCL.

Analytical results for high explosives (HE) are listed in Table-3. Samples were analyzed for HE compounds at monitoring wells CTF-MW2 and CTF-MW3. The compound RDX was detected above the practical quantitation limit at monitoring well CTF-MW2 at a concentration of 0.32 µg/L.

Analytical results for radionuclides are listed in Table-4. Samples were analyzed for gross alpha and beta, gamma emitting isotopes, radium 226 and 228, and isotopic uranium. Unadjusted gross alpha activity ranged from 16.4 ± 7.7 pCi/L at CTF-MW3 to 61 ± 21 pCi/L at CTF-MW2. The EPA MCL for gross alpha activity of 15 pCi/L is based on a corrected gross alpha value, which excludes both total uranium and radon from initial gross alpha count. When the total uranium activity was subtracted from the gross alpha value, the gross activity was below the MCL. The combined radium-226 and radium-228 activities exceeded the EPA MCL of 5 pCi/L at monitoring well CTF-MW2. Radium-226 activity was 2.64 ± 0.42 pCi/L and radium-228 activity was 6.52 ± 0.77 pCi/L.

Analytical results for VOCs detected above the method detection limit (MDL) are listed in Table-5. No VOCs were detected above the established regulatory standards.

Response

Questions or comments should be addressed to Chris Armijo by phone at (505) 383-2070, by e-mail at chris.armijo1@state.nm.us, or to the address in the letterhead.
