**RE: 2007 NMED/DOE-Oversight Bureau Data Submittal Results from Technical Area-V  
Groundwater Monitoring at Sandia National Laboratories**

Dear Dr. Dye

The DOE Oversight Bureau, Sandia Oversight Section (DOE-OB/SOS) of the New Mexico Environment Department has compiled the Bureau's groundwater data from FFY 2007. Between November 2006 and September 2007, the DOE-OB/SOS split groundwater samples with Sandia National Laboratories, New Mexico (SNL/NM) at Technical Area-V (TA-V) monitoring wells: TAV-MW1, -MW2, -MW3, -MW4, -MW5, -MW6, -MW7, -MW8, -MW9, LWDS-MW1 and -MW2. The DOE-OB/SOS samples were submitted to Pinnacle Laboratories for organics, radiological, metals and general chemistry analyses.

Data Assessment

NMED/DOE-OB data results are compared to applicable Maximum Allowable Concentrations (MAC) from the New Mexico Water Quality Control Commission (WQCC) (20.6.2.3103A NMAC Human Health Standards) and Maximum Contaminant Levels (MCL) from the EPA National Primary Drinking Water Regulations (40 CFR 141).

Table-1 compares Target Analyte List (TAL) metals results to applicable MACs and MCLs. Samples were analyzed for total and dissolved TAL metals plus uranium and isotopic uranium. Uranium-235 and -238 were determined as mass concentrations during metals analysis on the inductively-coupled plasma mass spectrometer (ICP-MS) using method SW846 6020. The groundwater standards for metals analyses of the WQCC are based on dissolved concentrations. Column 3 in Table-1 indicates if the sample was taken as a total (Unfiltered-UF) or as a dissolved (Filtered-F). No metal concentrations were detected above established MACs or MCLs.

Table-2 compares radiological results to applicable standards. Analyses were performed for gamma spectroscopy, gross alpha/beta, isotopic radium and isotopic uranium. Gamma

spectroscopy analysis was performed using EPA method 901.1, gross alpha/beta analysis was performed using EPA method 900.0, isotopic radium analysis was performed using EPA methods 903.1 and 904.0 and isotopic uranium analysis was performed using DOE EML HASL-300 U -02-RC Modified and Eichrom ACW-03-15 methods.

Gamma spectroscopy detected radium-226/228 above the MCL of 5 pCi/L at monitoring wells TAV-MW4 and TAV-MW9. However, when the original samples were analyzed using methods 903.1 and 904.0 radium-226/228 was not detected above the Minimum Detectable Activity (MDA). All other radionuclides were below established MCLs.

Table-3 compares the non-metal inorganic analysis results to applicable MCLs. Inorganic chemical analysis was performed for nitrate plus nitrite (NPN) using EPA method 353.2. Nitrate concentrations exceeded the MCL of 10 mg/L at TAV monitoring wells AVN-1, MW6, and LWDS-MW1. The results were 10.1 mg/L, 10.2 mg/L, and 13.1 mg/L respectively.

Table-4 compares the organic analyses results to applicable EPA standards. Organic analyses were performed for Volatile Organic Compounds (VOCs) using EPA method 8260. During the third and fourth quarter TCE was detected above the MCL of 5 µg/L at monitoring wells TAV-MW6 and LWDS-MW1. Concentrations at TAV-MW6 during these two sampling events were 7.2 µg/L and 8.3 µg/L respectively. Concentrations at LWDS-MW1 during the third and forth quarter were 13.5 µg/L and 14 µg/L.

### Conclusion

Results for all total and dissolved TAL metals from all samples collected at Tech Area-V monitoring wells were below established MACs and MCLs.

All radionuclides analyzed for at TAV monitoring wells were below established MCLs.

Nitrate concentrations at TAV-AVN-1 and TAV-MW6 slightly exceeded the MCL of 10 mg/L. To date, the DOE-OB/SOS has not completed any trending analyses on these particular wells to determine if nitrate concentrations are increasing or decreasing. The nitrate concentration at monitoring well LWDS-MW1 also exceeded the MCL standard. The NPN concentration at LWDS-MW1 compares well with historical data provided by SNL/NM. Trending analysis performed by SNL/NM at LWDS-MW1 suggests that nitrate levels appear to be slightly decreasing over time. DOE-OB/SOS recommends that SNL/NM continue to sample these wells for NPN.

During the third and fourth quarter TCE was detected above the MCL of 5 µg/L at monitoring wells TAV-MW6 and LWDS-MW1. Trending analysis performed by SNL/NM suggests that TCE concentrations at TAV-MW6 have been increasing over time and concentrations at LWDS-MW1 indicate that TCE has been slightly decreasing. DOE-OB-SOS recommends that SNL/NM continue to sample these wells for VOCs.

The monitoring results will be provided to DOE for review and comment prior to their release as final to other State of New Mexico and federal agencies, the Pueblos, our website and interested

members of the public. If you have any questions, or if you would like copies of the complete data set, please contact Chris Armijo at (505)845-5824 or contact me at (505)845-5933.

Sincerely,

Barry S. Birch  
Program Manager  
Sandia Oversight Section
