[103] As noted above, we combined Maryland and the District of Columbia as a single entity in our contribution modeling. This is a logical approach because of the small size of the District of Columbia and, hence, its emissions and its close proximity to Maryland. Under our analysis, Maryland and the District of Columbia are linked as significant contributors to the same downwind nonattainment counties. The EPA received no adverse comment on this approach. We also considered these entities separately, and in view of the close proximity of these two areas we believe that Maryland is linked as a significant contributor to nonattainment in the District of Columbia and that the District of Columbia is linked as a significant contributor to nonattainment in Maryland.

2. Results of 8-Hour Ozone Contribution Modeling

In this section, we present the results of air quality modeling to determine which upwind States contribute significantly (before considering cost) to 8-hour ozone nonattainment in downwind States. The analytical procedures to determine which States make a significant contribution are based on the zero-out and source apportionment modeling techniques using CAMx, as described in section VI.C.2 and in the NFR AQMTSD. We performed ozone contribution modeling using both of these techniques for 31 States in the East and the District of Columbia (*i.e.*, Alabama, Arkansas, Connecticut, Delaware, Georgia, Florida, Iowa, Illinois, Indiana, Kentucky, Louisiana, Massachusetts, Maine, Maryland combined with the District of Columbia, Michigan, Minnesota, Mississippi, Missouri, New Hampshire, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, Tennessee, Vermont, Virginia, West Virginia, and Wisconsin).

We evaluated the interstate ozone contributions from each of the 31 upwind States and the District of Columbia to each of the 40 counties that are projected to be nonattainment in the 2010 base case (*i.e.*, "modeled" nonattainment) and are also "monitored" nonattainment in 2001–2003, as described in section VI.B.2.b. We analyzed the contributions from upwind States to these counties in terms of various metrics, described above and in more detail in the NFR AQMTSD.

Based on the State-by-State modeling, there are 25 States and the District of Columbia [104] which make a significant contribution (before considering cost) to 8-hour ozone nonattainment in downwind States (*i.e.*, Alabama, Arkansas, Connecticut, Delaware, the District of Columbia, Florida, Iowa, Illinois, Indiana, Kentucky, Louisiana, Massachusetts, Maryland, Michigan, Mississippi, Missouri, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Virginia, West Virginia, and Wisconsin). In Table VI–9, we provide a list of the downwind nonattainment counties to which each upwind State makes a significant contribution (*i.e.*, the upwind State-to-downwind nonattainment "linkages").

TABLE VI–9.—UPWIND STATE-TO-DOWNWIND NONATTAINMENT COUNTY SIGNIFICANT "LINKAGES" FOR 8-HOUR OZONE.

Upwind states	Total linkages	Downwind counties			
AL	3	Fulton GA	Harris TX	Jefferson TX.	
AR	3	Galveston TX	Harris TX	Jefferson TX.	
CT	2	Kent RI	Suffolk NY.		
DE	13	Bucks PA	Camden NJ	Chester PA	Gloucester NJ.

E. What are the Estimated Air Quality Impacts of the Final Rule?

In this section, we describe the air quality modeling performed to determine the projected impacts on $PM_{2.5}$ and 8-hour ozone of the SO_2 and NO_X emissions reductions in the control region modeled. The modeling used to estimate the air quality impact of these reductions assumes annual SO_2 and NO_X controls for Arkansas, Delaware, and New Jersey in addition to the 23-States plus the District of Columbia. Since Arkansas, Delaware, and New Jersey are not included in the final CAIR region for $PM_{2.5}$, the modeled estimated impacts on $PM_{2.5}$ are overstated for today's final rule. However, EPA plans to include Delaware and New Jersey in the CAIR region for $PM_{2.5}$ through a separate regulatory process. Thus, the estimates are reflective of the total impacts expected for CAIR assuming Delaware and New Jersey will become part of the annual SO_2 and NO_X trading programs.

As discussed in section IV, EPA analyzed the impacts of the regional emissions reductions in both 2010 and 2015. These impacts are quantified by comparing air quality modeling results for the regional control scenario to the modeling results for the corresponding 2010 and 2015 base case scenarios. The 2010 and 2015 emissions reductions from the power generation sector include a two-phase cap and trade program covering the control region modeled (*i.e.*, the 23 States plus the District of Columbia included in today's rule and Arkansas, Delaware, and New Jersey).[105] Phase 1 of the regional strategy (the 2010 reductions) is forecast to reduce total EGU SO_2 emissions [106] in

[105] In addition to the SO_2 and NO_X reductions in these States, we also modeled summer-season only EGU NO_X controls for Connecticut and Massachusetts, which significantly contribute to ozone, but not to $PM_{2.5}$ nonattainment in downwind areas.

[106] For the purposes of this discussion, we have calculated the percent reduction in total EGU

NMED Exhibit 7f

the control region modeled by 40 percent in 2010. Phase 2 (the 2015 reductions) is forecast to provide a 48 percent reduction in EGU SO_2 emissions compared to the base case in 2015. When fully implemented post-2015, we expect this rule to result in more than a 70 percent reduction in EGU SO_2 emissions compared to current emissions levels. The reductions at full implementation occur post-2015 due to the existing title IV bank of SO_2 allowances, which can be used under the CAIR program. The net effect of the strategy on total SO_2 emissions in the control region modeled considering all sources of emissions, is a 28 percent reduction in 2010 and a 32 percent reduction in 2015.

For NO_X, Phase 1 of the strategy is forecast to reduce total EGU emissions by 44 percent in 2009. Total NO_X emissions across the control region (*i.e.*, includes all sources) are 11 percent lower in the 2010 CAIR scenario compared to the emissions in the 2010 base case. In Phase 2, EGU NO_X emissions are projected to decline by 54 percent in 2015 in this region. Total NO_X emissions from all anthropogenic sources are projected to be reduced by 14 percent in 2015. The percent change in emissions by State for SO_2 and NO_X in 2010 and 2015 for the regional control strategy modeled are provided in the NFR EITSD.

1. Estimated Impacts on $PM_{2.5}$ Concentrations and Attainment

We determined the impacts on $PM_{2.5}$ of the CAIR regional strategy by running the CMAQ model for this strategy and comparing the results to the $PM_{2.5}$ concentrations predicted for the 2010 and 2015 base cases. In brief, we ran the CMAQ model for the regional strategy in both 2010 and 2015. The model predictions were used to project future $PM_{2.5}$ concentrations for CAIR in 2010 and 2015 using the SMAT technique, as described in section VI.B.1. We compared the results of the 2010 and 2015 regional strategy modeling to the corresponding results from the 2010 and 2015 base cases to quantify the expected impacts of CAIR.

The impacts of the SO_2 and NO_X emissions reductions expected from CAIR on $PM_{2.5}$ in 2010 and 2015 are provided in Table VI–10 and Table VI–11, respectively. In these tables, counties shown in bold/italics are projected to come into attainment with CAIR.

As described in section VI.B.1, we project that 79 counties in the East will be nonattainment for $PM_{2.5}$ in the 2010 base case. We estimate that, on average, the regional strategy will reduce $PM_{2.5}$ in these 79 counties by 1.6 $\mu g/m^3$. In over 90 percent of the nonattainment counties (*i.e.*, 74 out of 79 counties), we project that $PM_{2.5}$ will be reduced by at least 1.0 $\mu g/m^3$. In over 25 percent of the 79 nonattainment counties (*i.e.*, 23 of the 79 counties), we project $PM_{2.5}$ concentrations will decline by of more than 2.0 $\mu g/m^3$. Of the 79 counties that are nonattainment in the 2010 Base, we project that 51 counties will come into attainment as a result of the SO_2 and NO_X emissions reductions expected from the regional controls. Even those 28 counties that remain nonattainment in 2010 after implementation of the regional strategy will be closer to attainment as a result of these emissions reductions. Specifically, the average reduction of $PM_{2.5}$ in the 28 residual nonattainment counties is projected to be 1.3 $\mu g/m^3$. After implementation of the regional controls, we project that 18 of the 28 residual nonattainment counties in 2010 will be within 1.0 $\mu g/m^3$ of the NAAQS and 12 counties will be within 0.5 $\mu g/m^3$ of attainment.

In 2015 we are projecting that $PM_{2.5}$ in the 74 base case nonattainment counties will be reduced by 1.8 $\mu g/m^3$, on average, as a result of the SO_2 and NO_X reductions in the regional strategy. In over 90 percent of the nonattainment counties (*i.e.*, 67 of the 74 counties) concentrations of $PM_{2.5}$ are predicted to be reduced by at least 1.0 $\mu g/m^3$. In over 35 percent of the counties (*i.e.*, 27 of the 74 counties), we project the regional strategy to reduce $PM_{2.5}$ by more than 2.0 $\mu g/m^3$. As a result of the reductions in $PM_{2.5}$, 56 nonattainment counties are projected to come into attainment in 2015. The remaining 18 nonattainment counties are projected to be closer to attainment with the regional strategy. Our modeling results indicate that $PM_{2.5}$ will be reduced in the range of 0.7 μg/m^3 to 2.9 μg/m^3 in these 18 counties. The average reduction across these 18 residual nonattainment counties is 1.5 μg/m^3.

Thus, the SO_2 and NO_X emissions reductions which will result from the regional strategy will greatly reduce the extent of $PM_{2.5}$ nonattainment by 2010 and beyond. These emissions reductions are expected to substantially reduce the number of $PM_{2.5}$ nonattainment counties in the East and make attainment easier for those counties that remain nonattainment by substantially lowering $PM_{2.5}$ concentrations in these residual nonattainment counties.

2. Estimated Impacts on 8-Hour Ozone Concentrations and Attainment

We determined the impacts on 8-hour ozone of the regional strategy by running the CAM_X model for this strategy and comparing the results to the ozone concentrations predicted for the 2010 and 2015 base cases. In brief, we ran the CAM_X model for the regional strategy in both 2010 and 2015. The model predictions were used to project future 8-hour ozone concentrations for the regional strategy in 2010 and 2015 using the Relative Reduction Factor technique, as described in section VI.B.1. We compared the results of the 2010 and 2015 regional strategy modeling to the corresponding results from the 2010 and 2015 base cases to quantify the expected impacts of the regional controls.

The results of the regional strategy ozone modeling are expressed in terms of the expected reductions in projected 8-hour concentrations and the implications for future nonattainment. The impacts of the regional NO_X emissions reductions on 8-hour ozone in 2010 and 2015 are provided in Table VI–12 and Table VI–13, respectively. In these tables, counties shown in bold/italics are projected to come into attainment with the regional controls.

As described in section VI.B.1, we project that 40 counties in the East would be nonattainment for 8-hour ozone under the assumptions in the 2010 base case. Our modeling of the regional controls in 2010 indicates that 3 of these counties will come into attainment of the 8-hour ozone NAAQS and that ozone in 16 of the 40 nonattainment counties will be reduced by 1 ppb or more. In addition, our modeling predicts that 8-hour ozone exceedances (*i.e.*, 8-hour ozone of 85 ppb or higher) within nonattainment areas are expected to decline by 5 percent in 2010 with CAIR. Of the 37 counties that are projected to remain nonattainment in 2010 after the regional strategy, nearly half (*i.e.*, 16 of the 37 counties) are within 2 ppb of attainment.

In 2015, we project that 6 of the 22 counties which are nonattainment for 8-hour ozone in the base case will come into attainment with the regional strategy. Ozone concentrations in over 70 percent (*i.e.*, 16 of 22 counties) of the 2015 base case nonattainment counties are projected to be reduced by 1 ppb or more as a result of the regional strategy. Exceedances of the 8-hour ozone NAAQS are predicted to decline in nonattainment areas by 14 percent with regional controls in place in 2015. Thus, the NO_X emissions reductions which will result from the regional strategy will help to bring 8-hour ozone nonattainment areas in the East closer to attainment by 2010 and beyond.

F. What are the Estimated Visibility Impacts of the Final Rule?

1. Methods for Calculating Projected Visibility in Class I Areas

The NPR contained example future year visibility projections for the 20 percent worst days and 20 percent best days at Class I areas that had complete IMPROVE monitoring data in 1996. Changes in future visibility were predicted by using the REMSAD model to generate relative visibility changes, then applying those changes to measured current visibility data. Details of the visibility modeling and calculations can be found in the NPR AQMTSD. An example visibility calculation was given in Appendix M of the NPR AQMTSD along with the predicted improvement in visibility (in deciviews) on the 20 percent best and worst days at 44 Class I areas. The data contained in Appendix M was for informational purposes only and was not used in the significant contribution determination or control strategy development decisions.

The SNPR contained visibility calculations in support of the ''better-than-BART'' analysis. The better-than-BART analysis employed a two-pronged test to determine if the modeled visibility improvements from the CAIR cap and trade program for EGU's were ''better'' than the visibility improvements from a nationwide BART program. The analysis used the visibility calculation methodology detailed in the NPR TSD. Detailed results of the SNPR better-than-BART analysis are contained in the SNPR AQMTSD. The better-than-BART analysis for the final rule is addressed in section IX.C.2 of the preamble. Additional information on the visibility calculation methodology is contained in the NFR AQMTSD.

2. Visibility Improvements in Class I Areas

For the NFR we have modeled several new CAIR [107] and CAIR + BART cases to re-examine the better-than-BART two-pronged test. We have modeled an updated nationwide BART scenario as well as a CAIR in the East/BART in the West scenario. The results were analyzed at 116 Class I areas that have complete IMPROVE data for 2001 or are represented by IMPROVE monitors with complete data. Twenty-nine of the Class I areas are in the East and 87 are in the West. The results of the visibility analysis are summarized in section IX.C.2. Detailed results for all 116 Class I areas are presented in the NFR AQMTSD.

VII. SIP Criteria and Emissions Reporting Requirements

This section describes: (1) The criteria we will use in determining approvability of SIPs submitted to meet the requirements of today's rulemaking; (2) the dates for submittal of the SIPs that are required under the CAIR; (3) the consequences of either failing to submit such a SIP or submitting a SIP which is

[107] The CAIR scenario modeled for the visibility analysis included controls in Arkansas, Delaware, and New Jersey.

NMED Exhibit 7f

disapproved; and (4) the emissions inventory reporting requirements for States.

A. What Criteria Will EPA Use To Evaluate the Approvability of a Transport SIP?

1. Introduction

The approvability criteria for CAIR SIP submissions are finalized today in 40 CFR 51.123 (NO_X emissions reductions) and in 40 CFR 51.124 (SO_2 emissions reductions). Most of the criteria are substantially similar to those that currently apply to SIP submissions under CAA section 110 or part D (nonattainment). For example, each submission must describe the control measures that the State intends to employ, identify the enforcement methods for monitoring compliance and managing violations, and demonstrate that the State has legal authority to carry out its plan.

This part of the preamble explains additional approvability criteria specific to the CAIR that were proposed and discussed in the CAIR NPR or in the CAIR SNPR, and are being promulgated today. As explained in both the CAIR NPR and the CAIR SNPR, EPA proposed that each affected State must submit SIP revisions containing control measures that assure that a specified amount of NO_X and SO_2 emissions reductions are achieved by specified dates.

Although EPA determined the amount of emissions reductions required by identifying specific, highly cost-effective control levels for EGUs, EPA explained in the CAIR NPR and the CAIR SNPR that States have flexibility in choosing which sources to control to achieve the required emissions reductions. As long as a State's emissions reductions requirements are met, a State may impose controls on EGUs only, on non-EGUs only, or on a combination of EGUs and non-EGUs. The SIP approvability criteria are intended to provide as much certainty as possible that, whichever sources a State chooses to control, the controls will result in the required amount of emissions reductions.

In the CAIR NPR, EPA proposed a ''hybrid'' approach for the mechanisms used to ensure emissions reductions are achieved. This approach incorporates elements of an emissions ''budget'' approach (requiring an emissions cap on affected sources) and an ''emissions reduction'' approach (not requiring an emissions cap). In this hybrid approach, if States impose control measures on EGUs, they would be required to impose an emissions cap on all EGUs, which would effectively be an emissions budget. And, as stated in the CAIR NPR, if States impose control measures on non-EGUs, they would be encouraged but not required to impose an emissions cap on non-EGUs. In the CAIR NPR, we requested comment on the issue of requiring States to impose caps on any source categories that the State chooses to regulate.

In the CAIR SNPR, we proposed to modify the hybrid approach and require States that choose to control large industrial boilers or turbines (greater than 250 MMBTU/hr) to impose an emissions cap on all such sources within their State. This is similar to EPA's approach in the NO_X SIP Call which required States to include an emissions cap on such sources as well as on EGUs if the SIP submittals included controls on such sources. (See 40 CFR 51.121(f)(2)(ii).)

A few commenters supported the use of emissions caps on any source category subject to CAIR controls, including non-EGUs, because it would be the most effective way to demonstrate compliance with the budget. A few other commenters opposed the use of an emissions cap on non-EGUs, saying either that States should have the flexibility to determine whether to impose a cap, or that such a requirement would result in increased costs for non-EGUs including cogeneration units that are non-EGUs. No commenter opposing such a requirement provided any information indicating that such a requirement would be ineffective or impracticable. Today EPA is adopting the modified approach, as described in the CAIR SNPR, that States choosing to control EGUs or large industrial boilers or turbines must do so by imposing an emissions cap on such sources, similar to what was required in the NO_X SIP Call.

Extensive comments were received regarding the need for an ozone season NO_X cap in States identified to be contributing significantly to the region's ozone nonattainment problems. In proposal, EPA stated that the annual NO_X cap under CAIR reduced NO_X emissions sufficiently enough to not warrant a regional ozone season NO_X cap. Commenters remained very concerned that the annual NO_X cap would not aid ozone attainment. While EPA feels that the annual NO_X limit will most likely be protective in the ozone season, a seasonal cap will provide certainty, which EPA agrees is very important in the effort to help areas achieve ozone attainment. Today, EPA is finalizing an ozone season NO_X cap for States shown to contribute significantly for ozone. As is further explained in section VIII, EPA is also finalizing an ozone season trading program that States may use to achieve the required emissions reductions. This program will subsume the existing NO_X SIP Call trading program. Therefore, any State that wishes to continue including its sources in an interstate trading program run by EPA to achieve the emissions reductions required by EPA must modify its SIP to conform with this new trading program.

The EPA will automatically find that a State is continuing to meet its NO_X SIP Call obligation if it achieves all of its required CAIR emissions reductions by capping EGUs, it modifies its existing NO_X SIP Call to require its non-EGUs currently participating in the NO_X SIP Call budget trading program to conform to the requirements of the CAIR ozone season NO_X trading program with a trading budget that is the same or tighter than the budget in the currently approved SIP, and it does not modify any of its other existing NO_X SIP Call rules. If a State chooses to achieve the ozone season NO_X emissions reduction requirements of CAIR in another way, it will also be required to demonstrate that it continues to meet the requirements of the NO_X SIP Call.

Specific criteria for approval of CAIR SIP submissions as promulgated by today's action are described below. The criteria are dependent on the types of sources a State chooses to control.

2. Requirements for States Choosing To Control EGUs

a. Emissions Caps and Monitoring

As explained in the CAIR NPR (69 FR 4626), and in the CAIR SNPR (69 FR 32691), EPA proposed requiring States to apply the ''budget'' approach if they choose to control EGUs; that is, each State must cap total EGU emissions at the level that assures the appropriate amount of reductions for that State. The requirement to cap all EGUs is important because it prevents shifting of utilization (and resulting emissions) to uncapped EGUs. The EGUs are part of a highly interconnected electricity grid that makes utilization shifting likely and even common. The units are large and offer the same market product (*i.e.*, electricity), and therefore the units that are least expensive to operate are likely to be operated as much as possible. If capped and uncapped units are interconnected, the uncapped units' costs would tend to decrease relative to the capped units, which must either reduce emissions or use or buy allowances, and the uncapped units' utilization would likely increase. The cap ensures that emissions reductions

NMED Exhibit 7f

from these interconnected sources are actually achieved rather than emissions simply shifting among sources. The caps constitute the State EGU Budgets for SO_2 and NO_X. Additionally, EPA proposed that, if States choose to control EGUs, they must require EGUs to follow part 75 monitoring, recordkeeping, and reporting requirements. Part 75 monitoring and reporting requirements have been used effectively for determining NO_X and SO_2 emissions from EGUs under the title IV Acid Rain program and the NO_X SIP Call program and in combination with emissions caps are an integral part of those programs. (Additional explanation for the need for Part 75 monitoring is given in the NPR and SNPR and is incorporated here.) Therefore, today, EPA adopts the requirements for emission caps and Part 75 monitoring for EGUs in these States.

b. Using the Model Trading Rules As

proposed, if a State chooses to allow its EGUs to participate in EPA-administered interstate NO_X and SO_2 emissions trading programs, the State must adopt EPA's model trading rules, as described elsewhere in today's preamble and in §§ 96.101–96.176 (for NO_X) and §§ 96.201–96.276 (for SO_2), set forth below. Additionally, EPA proposed that for the States for which EPA made a finding of significant contribution for both ozone and $PM_{2.5}$, participation in both the NO_X and SO_2 trading programs would be required in order to be included in the EPA-administered program. States for which the finding was for ozone only could choose to participate in only the EPA-administered NO_X trading program through adoption of the NO_X model trading rule. The EPA stated that States adopting EPA's model trading rules, modified only as specifically allowed by EPA, will meet the requirement for applying an emissions cap and requirement to use part 75 monitoring, recordkeeping, and reporting for EGUs.

Some commenters opposed EPA's proposal to require participation in both the NO_X and SO_2 trading programs because some States may want to participate in the EPA-administered trading programs for only NO_X or only SO_2. A few commenters claimed that the requirement to participate in both programs would limit State flexibility or is an ''all or nothing'' approach; other commenters objected that there was no environmental basis for such a requirement; and one commenter suggested that States not affected by CAIR but that volunteer to control emissions should be permitted to join the program for one or both pollutants. Additionally, commenters cited a need for an ozone season NO_X program.

The EPA has taken the comments into account and in today's action agrees to allow a State identified to contribute significantly for $PM_{2.5}$ (and therefore required to make annual SO_2 and NO_X reductions) to participate in the EPA-administered CAIR trading program for either SO_2 or NO_X, not necessarily both, so long as the State adopts the model rule for the applicable trading program.

In response to extensive comments relating to EPA's proposal to forego a seasonal NO_X cap because EPA demonstrated that the annual NO_X cap was sufficiently stringent, EPA is finalizing an ozone season NO_X trading program for States identified as contributing significantly for ozone. These States will be subject to an ozone season NO_X cap and an annual NO_X cap if the State is also identified as contributing significantly for $PM_{2.5}$. Therefore, today's action includes an additional model rule for an ozone season NO_X trading program (40 CFR 96, subparts AAAA through IIII). The States that may use the ozone season NO_X trading program but not the annual NO_X trading program are those States in the CAIR region identified as contributing significantly for ozone only (Arkansas, Connecticut, Delaware, Massachusetts, and New Jersey).

As discussed in the proposal, EPA is finalizing the option for New Hampshire and Rhode Island to participate in the regional trading program through use of the CAIR ozone season NO_X model rule because sources in these States have made investments in NO_X controls in the past based on the existence of a regional ozone season NO_X trading program. Additionally, the States' combined projected 2010 and 2015 NO_X emissions are less than one-half of one percent of the total CAIR regional NO_X cap and therefore would not create a significant increase in the CAIR cap. All comments received were supportive of this approach and EPA is finalizing it today.

None of these States (Arkansas, Connecticut, Delaware, Massachusetts, New Hampshire, New Jersey, or Rhode Island) has the option to participate in the EPA-administered CAIR SO_2 trading program nor the annual CAIR NO_X trading program because there are no $PM_{2.5}$-related emissions reductions required under today's action in those States. (Of course, sources in these States will still be subject to the Acid Rain SO_2 cap and trade program.) Likewise, Texas, Minnesota and Georgia may not participate in the ozone season NO_X program, because they have not been shown to contribute significantly to the regional ozone problem. They are, however, required to make annual NO_X and SO_2 reductions and may choose to participate in the annual NO_X and annual SO_2 trading program to meet their CAIR obligations.

Except for the special cases of Rhode Island and New Hampshire, other States outside of the CAIR region may not participate in the CAIR trading programs for either pollutant, because they were not shown to contribute significantly to $PM_{2.5}$ or ozone nonattainment in the CAIR region. Allowing States outside of the CAIR region to participate would generally create an opportunity—through net sales of allowances from the non-CAIR States to CAIR States—for emission increases in States that have been shown to contribute significantly to nonattainment in the CAIR region.[108]

A State may not participate in the EPA-administered trading programs if they choose to get a portion of CAIR reductions from non-EGUs. (This is also discussed in Section VIII.) The EPA maintains that requiring certain consistencies among States in the regionwide trading programs that EPA has offered to run does not unfairly limit States' flexibility to choose an approach for achieving CAIR mandated reductions that is best suited for a particular State's unique circumstances. States are free to achieve the reductions through whatever alternative mechanisms the States wish to design; for example, a group of States could cooperatively implement their own multi-State trading programs that EPA would not administer.

c. Using a Mechanism Other Than the Model Trading Rules

If States choose to control EGUs through a mechanism other than the EPA-administered NO_X and SO_2 emissions trading programs, then the States (i) must still impose an emissions cap on total EGU emissions and require part 75 monitoring, recordkeeping, and reporting requirements on all EGUs, and (ii) must use the same definition of EGU as EPA uses in its model trading rules, i.e., the sources described as ''CAIR units'' in § 96.102, § 96.202, and § 96.302. A few commenters expressed concern that these requirements limit States' discretion in designing control measures to meet the CAIR requirements, but failed to offer any

[108] Title IV allowances can however be traded freely across the boundary of the CAIR region without any significant, negative environmental consequence. The potential negative consequences have been addressed through other requirements discussed below, like the retirement of excess title IV allowances.

NMED Exhibit 7f

reason why the requirements would be impracticable or ineffective. The EPA believes that the requirements are necessary for a number of reasons. The requirements to cap all EGUs and to use the same definition of EGU are important because they prevent shifting of utilization (and resulting emissions) from capped to uncapped sources. In this case, not requiring a cap on total EGU emissions in these States is likely to result in increased utilization and consequently increased emissions in these States. The requirement to use part 75 monitoring ensures the accuracy of monitored data and consistency of reporting among sources (and thus the certainty that emissions reductions actually occurred) across all States. Furthermore, most EGUs are currently monitoring and reporting using part 75 so it does not impose an additional requirement. Therefore, EPA is finalizing the proposed approach.

If a State chooses to design its own intrastate or interstate NO_X or SO_2 emissions trading programs, the State must, in addition to meeting the requirements of the rules finalized in today's action, consider EPA's guidance, ''Improving Air Quality with Economic Incentive Programs,'' January, 2001 (EPA–452/R–01–001) (available on EPA's Web site at: *http://www.epa.gov/ttn/ecas/incentiv.html*). The State's programs are subject to EPA approval. The EPA will not administer a State-designed trading program. Additionally, it should be noted that allowances from any alternate trading program may not be used in the EPA-administered trading programs.

d. Retirement of Excess Title IV Allowances

The CAIR NPR proposed requirements on SIPs relating to the effects of title IV SO_2 allowance allocations for 2010 and beyond that are in excess of the State's CAIR EGU SO_2 emissions budget. The requirements were intended to ensure that the excess is not used in a manner that would lead to a significant increase in supply of title IV allowances, the collapse of the price of title IV allowances, the disruption of operation of the title IV allowance market and the title IV SO_2 cap and trade system, and the potential for increased emissions in all States prior to 2010 and in non-CAIR States in 2010 and later. These negative impacts on the title IV allowance market and on air quality, which are discussed in detail in section IX.B. below, would undermine the efficacy of the title IV program and could erode confidence in cap and trade programs in general. To avoid these impacts, EPA proposed to require retirement of the excess title IV allowances through a retirement ratio mechanism.

The EPA proposed, as a mechanism for removing these additional allowances and meeting the 50 percent reduction required under phase I (2010–2014), that each affected EGU had to hold, and EPA would retire, two vintage 2010–2014 allowances for every ton of SO_2 that the unit emits. Further, EPA proposed that, for phase II (which begins in 2015) when a 65 percent reduction is required, each affected EGU had to hold, and EPA would retire, three vintage 2015 and beyond allowances for every ton of SO_2 that the unit emits. This 3-to-1 ratio would result in slightly more reductions than EPA has determined were necessary to eliminate the significant contribution by an upwind State.

In the CAIR SNPR, EPA proposed two alternatives for addressing the issue of the additional allowances. Under the first alternative, affected EGUs had to hold, and EPA would retire, vintage 2015 and beyond allowances at a rate of 2.86-to-1 rather than 3-to-1, which would result in exactly the amount of reductions EPA has determined are necessary to eliminate a State's significant contribution.

Alternatively, also in the CAIR SNPR, EPA proposed requiring the retirement of 2015 and beyond vintage allowances at a 3-to-1 ratio and permitting States to convert the additional reductions into allowances in their rules. The EPA also suggested that some States may want to use these reserved allowances to create an incentive for additional local emissions reductions that will be needed to bring all areas into attainment with the $PM_{2.5}$ NAAQS.

As part of today's final CAIR rulemaking, EPA is finalizing a ratio of 2.86-to-one. The ratio ultimately represents a reduction of 65 percent from the final title IV cap level, which has been found to be highly cost-effective. For a detailed discussion regarding EPA's determination of highly cost-effective, please refer to Section IV of the final CAIR preamble. As discussed earlier, EPA must employ a uniform ratio across sources to ensure consistency and the same cost-effectiveness level across sources. Therefore, EPA will use a Phase II ratio of 2.86-to-1 for all States affected by CAIR who choose to participate in the trading program.

Today, EPA is finalizing the general requirement that all SIPs must include a mechanism to ensure that excess SO_2 allowances are retired. Furthermore, for States that participate in the EPA-administered cap and trade program, EPA is finalizing a specific mechanism that States must use.

i. States Participating in the EPA-Administered SO_2 Trading Program

If a State chooses to participate in the EPA-administered trading program, the State's excess title IV allowance retirement mechanism must follow the provisions of the SO_2 model trading rule that requires that vintage 2010 through 2014 title IV allowances be retired at a ratio of two allowances for every ton of emissions and that vintage 2015 and beyond title IV allowances be retired at a ratio of 2.86 allowances for every ton of emissions. Pre-2010 vintage allowances would be retired at a ratio of one allowance for every ton of emissions. (See discussion of the model SO_2 cap and trade rule in section VIII of today's preamble.) States using the model SO_2 cap and trade rule satisfy the requirement for retirement of excess title IV allowances.

ii. States Not Participating in the EPA-Administered SO_2 Trading Program

In the CAIR NPR, EPA stated that if a State does not choose to participate in the EPA-administered trading programs but controls only EGUs, the State may choose the specific method to retire allowances in excess of its budget. The EPA considered alternative ways for retiring these excess allowances and, as stated in the CAIR SNPR, believed that the use by different States of different means to address this concern could undermine the regionwide emissions reduction goals of the CAIR rulemaking. The EPA further described its concerns in section II of the preamble to the CAIR SNPR. (*See* 69 FR 32686–32688.) Because of these concerns, in the CAIR SNPR, EPA withdrew the CAIR NPR proposal on this point and re-proposed that all States use a 2-for-1 retirement ratio for vintage 2010 through 2014 allowances and a 2.86-for-1 or a 3-for-1 retirement ratio for vintage 2015 and beyond allowances to address concerns about title IV allowances that exceed State budgets. The EGUs would have a total emissions cap enforced by the State.

The SNPR described that for sources affected by both title IV and CAIR, allowance deductions and associated compliance determinations would be sequential. That is, title IV compliance would be determined and then CAIR compliance would be determined. So, in 2010–2014, after surrendering one vintage 2010 through 2014 allowance for each ton of emissions for title IV compliance, the source would then surrender one additional allowance (for a total of two allowances for each ton

NMED Exhibit 7f

which meets the CAIR requirement). Similarly, in 2015 and beyond, after surrendering one vintage 2015 and beyond allowance for each ton of emissions for title IV compliance, the source would surrender 1.86 or 2 additional allowances and therefore meet the CAIR requirement. Commenters argued that in States where EGUs are not trading under CAIR that the excess title IV allowances could be removed in a variety of ways and that EPA did not need to require each State do this the same way, only that each State ensure that they are removed.

Today, EPA adopts the following requirement: If a State does not choose to participate in the EPA-administered trading programs but controls only EGUs, the State must include in its SIP a mechanism for retiring the excess title IV allowances (i.e., the difference between total allowance allocations in the State and the State EGU SO_2 budget). To meet this requirement, the State may use the above-described retirement mechanism or may develop a different mechanism that will achieve the required retirement of excess allowances.

3. Requirements for States Choosing to Control Sources Other Than EGUs

a. Overview of Requirements

As noted in both the CAIR NPR and the CAIR SNPR, if a State chooses to require emissions reductions from non-EGUs, the State must adopt and submit SIP revisions and supporting documentation designed to quantify the amount of reductions from the non-EGU sources and to assure that the controls will achieve that amount. Although EPA did not propose in the CAIR NPR that States be required to impose an emissions cap on those sources, but instead solicited comment on the issue, EPA proposed in the CAIR SNPR that States be required to impose an emissions cap in certain cases on non-EGU sources. (See discussion in VII.A.1 of today's preamble.)

If a State chooses to obtain some, but not all, of its required reductions for SO_2 or NO_X emissions from non-EGUs, it would still be required to set an EGU budget for SO_2 or NO_X respectively, but it would set such a budget at some level higher than shown in Tables V–1, V–2, or V–4 in today's preamble, thus allowing more emissions from EGUs. The difference between the amount of a State's SO_2 budget in Table V–1 and a State's selected higher EGU SO_2 budget would be the amount of SO_2 emissions reductions the State demonstrates it will achieve from non-EGU sources. By the same token, the difference between the amount of a State's annual NO_X budget in Table V–2 and a State's selected higher annual EGU NO_X budget would be the amount of annual NO_X emissions reductions the State demonstrates it will achieve from non-EGU sources.[109] Further, the difference between the amount of a State's seasonal NO_X budget in Table V–4 and a State's selected higher ozone season EGU NO_X budget would be the amount of ozone season NO_X emissions reductions the State demonstrates it will achieve from non-EGU sources.

Special Concerns About SO_2 Allowances

In the case where a State requires a portion of its SO_2 emissions reductions from non-EGU sources and a portion from EGUs, there remains a concern about the impact of excess title IV allowances above a State's EGU cap, particularly on the operation of the title IV SO_2 cap and trade program. Consequently, today, we are adopting the requirement that these States include a mechanism for retirement of the allowances in excess of the State's SO_2 budget.

Like a State choosing to control only EGUs but not to participate in the trading program, a State that chooses to control non-EGUs and EGUs must adopt a mechanism for retiring surplus title IV allowances. The number of title IV allowances that must be retired is equal to the difference between the number of title IV allowances allocated to EGUs in that State and the SO_2 budget the State sets for EGUs under this rule. If the State uses a retirement mechanism (as discussed in VII.A.2.d.) in which a source surrendering allowances under the title IV SO_2 cap and trade program surrenders more allowances than otherwise required under title IV, the total number of allowances surrendered per ton of emissions in this case will be less than 2 to 1 in Phase 1 and less than 2.86 to 1 in Phase 2. This is because the non-EGUs will control to achieve a portion of the CAIR SO_2 reduction required, and so there will be a smaller surplus of title IV allowances than if all the required reductions were achieved by EGUs. The appropriate retirement factor will equal two times the State's SO_2 budget in Phase I or 2.86 times the State's SO_2 budget in Phase II as noted in Table V–1 of the budget section, divided by the State's selected higher EGU SO_2 budget (taking into account non-EGU reductions). The factor could then be used as the EGU retirement ratio for compliance purposes in a scenario where a State has decided to control SO_2 emissions from EGUs through a mechanism other than the EPA-administered trading program.

A simplified example can help illustrate this. Let us assume a State's sources were allocated a total of 200 allowances under title IV. Under CAIR, in Phase I, the State's reduction requirement would thus be 100 tons. Suppose this State decided that 25 tons would be reduced by non-EGUs and the remaining 75 tons would be reduced by the EGUs. (The State's budget for EGUS would increase to 125 tons.) The State would also need to retire 75 excess title IV allowances. This could be accomplished by requiring each Acid Rain source to surrender a total of 1.6 vintage 2010 through 2014 allowances (200 allowances allocated in the State/ 125 tons in State EGU budget) per ton of SO_2 emissions. The allowances surrendered would satisfy the Acid Rain Program requirement of surrendering one allowance per ton of emissions, as well as achieving the additional retirement requirement under CAIR since 200 allowances would be used for EGUs to emit the EGU budget of 125 tons of SO_2. (Pre-2010 allowances continue to be available for use on a one-allowance-per-ton-of-emissions basis here as in other situations.)

This is consistent with EPA's overall approach. If this same State decided to get all reductions (i.e., 100 tons) from EGUs, the State would require EGUs to retire 100 additional allowances by surrendering a total of 2 vintage 2010 through 2014 allowances (200 allowances allocated in the State/100 tons in State EGU budget) per ton of SO_2 emissions.

The demonstration of emissions reductions from non-EGUs is a critical requirement of the SIP revision due from a State that chooses to control non-EGUs. The State must take into account the amount of emissions attributable to the source category in both (i) the base case, in the implementation years 2010 and 2015, i.e., without assuming any SIP-required reductions under the CAIR from non-EGUs; and (ii) in the control case, in the implementation years 2010 and 2015, i.e., assuming SIP-required reductions under the CAIR from non-EGUs. We proposed an alternative methodology for calculating the base case for certain large non-EGU sources, as described below, but generally the difference between emissions in the base case and emissions in the control

[109] In the CAIR SNPR, EPA mistakenly cited the EGU budget numbers from Tables VI–9 and VI–10 in the CAIR NPR (69 FR 4619–20) when it should have cited Tables II–1 and II–2 in the CAIR SNPR. The EPA used the correct numbers, however, in the proposed regulatory text in the CAIR SNPR (69 FR 32729–30 and 69 FR 32733–34 (§§ 51.123(e)(2) and 51.124(e)(2)).

NMED Exhibit 7f

case equals the amount of emissions reductions that can be claimed from application of the controls on non-EGUs. (See discussion later in this section for criteria applicable to development of the baseline and projected control emissions inventories.)

States that meet the lesser of their CAIR ozone season NO_X budget or NO_X SIP Call EGU trading budget using the CAIR ozone season NO_X trading program also satisfy their NO_X SIP Call requirements for EGUs. States may also choose to include all of their NO_X SIP Call non-EGUs in the CAIR ozone season NO_X program at their NO_X SIP Call levels (i.e., the non-EGU trading budget remains the same).

To the extent EPA allows through the Regional Haze Rule and a State then chooses to use EPA analysis to show that CAIR reductions from EGUs meet BART requirements, States that achieve a portion of their CAIR reductions from sources other than EGUs and wanting to show that even with those reductions the EGUs will meet BART requirements must make a supplemental demonstration that BART requirements are satisfied.

b. Eligibility of Non-EGU Reductions

In the CAIR SNPR, EPA proposed that, in evaluating whether emissions reductions from non-EGUs would count towards the emissions reductions required under the CAIR, States may only include reductions attributable to measures that are not otherwise required under the CAA. Specifically, EPA proposed that States must exclude non-EGU reductions attributable to measures otherwise required by the CAA, including: (1) Measures required by rules already in place at the date of promulgation of today's final rule, such as adopted State rules, SIP revisions approved by EPA, and settlement agreements; (2) measures adopted and implemented by EPA (or other Federal agencies) such as emissions reductions required pursuant to the Federal Motor Vehicle Control Program for mobile sources (vehicles or engines) or mobile source fuels, or pursuant to the requirements for National Emissions Standards for Hazardous Air Pollutants; and (3) specific measures which are mandated under the CAA (which may have been further defined by EPA rulemaking) based on the classification of an area which has been designated nonattainment for a NAAQS, such as vehicle inspection and maintenance programs.

In discussing this proposal, EPA noted that States required to make CAIR SIP submittals may also be required to make separate SIP submittals to meet other requirements applicable to non-EGUs, *e.g.*, nonattainment SIPs required for areas designated nonattainment under the $PM_{2.5}$ or 8-hour ozone NAAQS or regional haze SIPs. The EPA noted it is likely that CAIR SIP submittals will be due before or at the same time as some of these other SIP submittals. We therefore proposed that States relying on reductions from controls on non-EGUs must commit in the CAIR SIP revisions to replace the emissions reductions attributable to any CAIR SIP measure if that measure is subsequently determined to be required to meet any other SIP requirement.

Some commenters objected to the proposed exclusion of credit for measures which are mandated under the CAA based on the classification of an area which has been designated nonattainment for a NAAQS, as well as to the proposed requirement that such measures must be replaced if they are later determined to be required in meeting separate SIP requirements. These commenters reasoned that such a requirement would not be applied to EGUs and would impose unnecessary and costly burdens on non-EGUs, thus creating an incentive for States to avoid controlling non-EGUs and to impose all CAIR reduction requirements on EGUs. One commenter further objected that, as long as a measure was not included in the base case EPA used to determine a State's contribution to other States' nonattainment under CAA section 110(a)(2)(D), there is no justification for excluding CAIR credit for such measure, and that EPA's proposed exclusion of credit for any measure ''otherwise required by the CAA'' is inconsistent with the NO_X SIP Call.

In response to these comments, EPA agrees that it is not appropriate to apply this proposed restriction inconsistently to EGUs and non-EGUs. Thus, EPA is adopting a modified form of the proposed criteria for the eligibility of non-EGU emissions reductions, eliminating the requirement that States must exclude non-EGU reductions attributable to measures otherwise required by the CAA based on the classification of an area which has been designated nonattainment for a NAAQS. Consequently, the final rule allows credit for measures that a State later adopts in response to requirements which result from an area's nonattainment classification, such as reasonably available control technology (RACT). With this change, all emissions reductions are eligible for credit in meeting CAIR except: (1) Measures adopted or implemented by the State as of the date of promulgation of today's final rule, such as adopted State rules, SIP revisions approved by EPA, and settlement agreements; and (2) measures adopted or implemented by the Federal government (*e.g.*, EPA or other Federal agencies) as of the date of submission of the SIP revision by the State to EPA, such as emissions reductions required pursuant to the Federal Motor Vehicle Control Program for mobile sources (vehicles or engines) or mobile source fuels, or pursuant to the requirements for National Emissions Standards for Hazardous Air Pollutants.

This exclusion of credit is consistent with EPA's approach in the NO_X SIP Call, although a direct comparison of the creditability requirements in the CAIR and in the NO_X SIP Call is not possible due to the timing and context in which both rules were developed. The NO_X SIP Call used statewide budgets for all sources as an accounting tool to determine the adequacy of a strategy, while the CAIR takes a different approach in which baseline emission inventories for non-EGU sectors will, if needed, be developed later. The NO_X SIP Call did, as does the CAIR, restrict States from taking credit for any Federal measures adopted after promulgation of the rule (63 FR 57427–28). It also did not allow credit for already adopted measures, but the timing of the NO_X SIP Call was such that nonattainment planning measures would have already likely been adopted as the SIP deadlines for adoption of such measures had passed. In today's action, nonattainment planning measures adopted after the promulgation of today's rule will be allowed credit under CAIR.

In order to take credit for CAIR reductions from non-EGUs, the reductions must be beyond what is required under the NO_X SIP Call. That is, a reduction must be in the non-ozone season or it must be beyond what is expected in the ozone season. Non-ozone season reductions must also be beyond what is in the base case, particularly for units that have low NO_X burners and certain SCRs (*e.g.*, ones required to be run annually). The reductions must be in addition to those already expected. If ozone season reductions are considered, the non-EGU NO_X SIP Call trading budget must be adjusted by the increment of CAIR reductions beyond the levels in the NO_X SIP Call. This removes the corresponding allowances from the market and ensures that the emissions do not shift to other sources.

After evaluating the eligibility of non-EGU reductions in accordance with the requirements discussed here, States must exclude credit for ineligible

NMED Exhibit 7f

measures by (i) including such measures in both the baseline and controlled emissions inventory cases, if they have already been adopted; or (ii) excluding them from both the base and control emissions inventory cases if they have not yet been adopted. (*See* discussion later in this section regarding development of emissions inventories and demonstration of non-EGU reductions.)

c. Emissions Controls and Monitoring

As noted in section VII.A.1., we modified the ''hybrid'' approach described in the CAIR NPR as it applies to certain non-EGUs, and adopt today the approach described in the CAIR SNPR. Specifically, for States that choose to impose controls on large industrial boilers and turbines, *i.e.*, those whose maximum design heat input is greater than 250 mmBtu/hr, to meet part or all of their emissions reductions requirements under the CAIR, State rules must include an emissions cap on all such sources in their State. Additionally, in this situation, States must require those large industrial boilers and turbines to meet part 75 requirements for monitoring and reporting emissions as well as recordkeeping. This ensures consistency in measurement and certainty of reductions and has been proven technologically and economically feasible in other programs.

If a State chooses to control non-EGUs other than large industrial boilers and turbines to obtain the required emissions reductions, the State must either (i) impose the same requirements, *i.e.*, an emissions cap on total emissions from non-EGUs in the source category in the State and part 75 monitoring, reporting and recordkeeping requirements; or (ii) demonstrate why such requirements are not practicable. In the latter case, the State must adopt appropriate alternative requirements to ensure that emissions reductions are being achieved using methods that quantify those emissions reductions, to the extent practicable, with the same degree of assurance that reductions are being quantified for EGUs and non-EGU boilers and turbines using part 75 monitoring. This is to ensure that, regardless of how a State chooses to meet the CAIR emissions reduction requirements, all reductions made by States to comply with the CAIR have the same, high level of certainty as that achieved through the cap and trade approach. Further, if a State adopts alternative requirements that do not apply to all non-EGUs in a particular source category (defined to include all sources where any aspect of production of one or more such sources is reasonably interchangeable with that of one or more other such sources), the State must demonstrate that it has analyzed the potential for shifts in production from the regulated sources to unregulated or less stringently regulated sources in the same State as well as in other States and that the State is not including reductions attributable to sources that may shift emissions to such unregulated or less regulated sources.

d. Emissions Inventories and Demonstrating Reductions

To quantify emissions reductions attributable to controls on non-EGUs, the States must submit both baseline and projected control emissions inventories for the applicable implementation years. We have issued many guidance documents and tools for preparing such emissions inventories, some of which apply to specific sectors States may choose to control.[110] While much of that guidance is applicable to today's rulemaking, there are some key differences between quantification of emissions reduction requirements under a SIP designed to help achieve attainment with a NAAQS and emissions reduction requirements under a SIP designed to reduce emissions that contribute significantly to a downwind State's nonattainment problem or interfere with maintenance in a downwind State. Because States are taking actions as a result of their impact on other States, and because the impacted States have no authority to reduce emissions from other States, the emissions reduction estimates become even more important. (For a complete discussion, see 69 FR 32693; June 10, 2004.)

Specifically, when we review CAIR SIPs for approvability, we intend to review closely the emissions inventory projections for non-EGUs to evaluate whether emissions reduction estimates are correct. We intend to review the accuracy of baseline historical emissions for the subject sources, assumptions regarding activity and emissions growth between the baseline year and 2010 [111] and 2015, and assumptions about the effectiveness of control measures.

Before describing the specific steps involved in this quantification process, EPA notes that a few commenters objected to the proposed requirements as arbitrary restrictions intended to discourage States' discretion in imposing control measures on non-EGUs since these requirements would use what the commenters describe as extremely conservative emissions baseline and emissions reduction estimates. No commenter refuted EPA's explanation, noted above, of the need for stringent requirements to ensure greater accuracy of emission inventories and greater certainty of reduction estimates used in SIPs addressing transported pollutants. The EPA maintains that the need for more accurate inventories and more certain reduction estimates justifies the requirements discussed below. Further, no commenter provided an alternate method of addressing EPA's concerns about the development of such inventories and reduction estimates. Thus, EPA is finalizing its proposed approach.

i. Historical Baseline

To quantify non-EGU reductions, as the first step, a historical baseline must be established for emissions of SO_2 or NO_X from the non-EGU source(s) in a recent year. The historical baseline inventory should represent actual emissions from the sources prior to the application of the controls. We expect that States will choose a representative year (or average of several years) during 2002–2005 for this purpose.

The requirements for estimating the historical baseline inventory that follow reflect EPA's view that, when States assign emissions reductions to non-EGU sources, achievement of those reductions should carry a high degree of certainty, just as EGU reductions can be quantified with a high degree of certainty in accordance with the applicable part 75 monitoring requirements. Because the non-EGU emissions reductions are estimated by subtracting controlled emissions from a projected baseline, if the historical baseline overestimates actual emissions, the estimated reductions could be higher than the actual reductions achieved.

For non-EGU sources that are subject to part 75 monitoring requirements, historical baselines must be derived from actual emissions obtained from part 75 monitored data. For non-EGU sources that do not have part 75 monitoring data, historical baselines must be established that estimate actual

[110] The many EPA guidance documents and tools for preparing emission inventory estimates for SO_2 and NO_X are available at the following Web sites: *http://www.epa.gov/ttn/chief/net/general.html*, *http://www.epa.gov/ttn/chief/eiip/techreport/*, *http://www.epa.gov/ttn/chief/publications.html#general*, *http://www.epa.gov/ttn/chief/software/index.html*, and *http://www.epa.gov/ttn/chief/efinformation.html*.

[111] The 2010 modeling date is relevant for both SO_2 and NO_X even though NO_X requirements begin in 2009. See Section IV for discussion.

NMED Exhibit 7f

emissions in a way that matches or approaches as closely as possible the certainty provided by the part 75 measured data for EGUs. For these sources, States must estimate historical baseline emissions using source-specific or category-specific data and assumptions that ensure a source's or source category's actual emissions are not overestimated.

To determine the baseline for sources that do not have part 75 measured data, States must use emission factors that ensure that emissions are not overestimated (*e.g.*, emission factors at the low end of a range when EPA guidance presents a range) or the State must provide additional information that shows with reasonable confidence that another value is more appropriate for estimating actual emissions. Other monitoring or stack testing data can be considered, but care must be taken not to overestimate baselines. If a production or utilization factor is part of the historical baseline emissions calculation, a factor that ensures that emissions are not overestimated must be used, or additional data must be provided. Similarly, if a control or rule effectiveness factor enters into the estimate of historical baseline emissions, such a factor must be realistic and supported by facts or analysis. For these factors, a high value (closer to 100 percent control and effectiveness) ensures that emissions are not overestimated.

ii. Projections of 2010 and 2015 Baselines

The second step in quantifying SO_2 or NO_X emissions reductions for non-EGUs is to use the historical baseline emissions and project emissions that would be expected in 2010 and 2015 without the CAIR. This step results in the 2010 and 2015 baseline emissions estimates.

The EPA proposed and requested comment on two procedures for estimating the future baselines: one relies on projections based on a number of estimated parameters; the second uses the lower of this projection and actual historical emissions. Today, EPA finalizes the second approach for determining 2010 and 2015 emissions baselines.

To estimate future emissions, States must use state-of-the-art methods for projecting the source or source category's economic output. Economic and population forecasts must be as specific as possible to the applicable industry, State, and county of the source and must be consistent with both national projections and relevant official planning assumptions, including estimates of population and vehicle miles traveled developed through consultation between State and local transportation and air quality agencies. However, if these official planning assumptions are themselves inconsistent with official U.S. Census projections of population or with energy consumption projections contained in the most recent Annual Energy Outlook published by the U.S. Department of Energy, then adjustments must be made to correct the inconsistency, or the SIP must demonstrate how the official planning assumptions are more accurate. If the State expects changes in production method, materials, fuels, or efficiency to occur between the baseline year and 2010 or 2015, the State must account for these changes in the projected 2010 and 2015 baseline emissions. For example, if a source has publicly announced a change or applied for a permit for a change, it should be reflected in the projections. The projection must also reflect any adopted regulations that are ineligible control measures and that will affect source emissions.

As stated above, EPA is requiring States to use the lower of historical baseline emissions or projected 2010 or 2015 emissions, as applicable, for a source category. This is because changes in production method, materials, fuels, or efficiency often play a key role in changes in emissions. Because of factors such as these, emissions can often stay the same or even decrease as productivity within a sector increases. These factors that contribute to emission decreases can be very difficult to quantify. Underestimating the impact of these types of factors can very easily result in a projection for increased emissions within a sector, when a correct estimate will result in a projection for decreased emissions within the sector. A few commenters opposed this methodology as arbitrary but failed to explain why EPA's concerns, as described above, are not valid. Commenters also failed to propose other methodologies for addressing these concerns. Thus, EPA is finalizing the use of this second methodology.

iii. Controlled Emissions Estimates for 2010 and 2015

The third step is to develop the 2010 and 2015 controlled emissions estimates by assuming the same changes in economic output and other factors listed above but adding the effects of the new controls adopted for the purpose of meeting the CAIR. The controls may take the form of regulatory requirements, *e.g.*, emissions caps, emission rate limits, technology requirements, or work practice requirements. The State's estimate of the effect of the control regulations must be realistic in light of the specific provisions for monitoring, reporting, and enforcement and experience with similar regulatory approaches.

In addition, the State's analysis must examine the possibility that the controls may cause production and emissions to shift to unregulated or less stringently regulated sources in the same State or another State. If all sources of a source category (defined to include all sources where any aspect of production is reasonably interchangeable) within the State are regulated with the same stringency and compliance assurance provisions, the analysis of production and emissions shifts need only consider the possibility of shifts to other States. If only a portion of a source category within a State is regulated, the analysis must also include any in-State shifting. In estimating controlled emissions in 2010 and 2015, assumptions regarding control measures that are not eligible for CAIR reduction credit must be the same as in the 2010 and 2015 baseline estimates. For example, a State may not take credit for reductions in the sulfur content of nonroad diesel fuel that are required under the recent Federal nonroad fuel rule (69 FR 38958; June 29, 2004). By including the effect of this Federal rule in both the baseline and controlled emissions estimates for 2010 and 2015, the State will appropriately exclude this ineligible reduction when it subtracts the controlled emissions estimates from the baseline emissions estimates.

The method that we are adopting today specifies the 2010 and 2015 emissions reductions which can be counted toward satisfying the CAIR. The method requires the use of the historical baseline or the baseline emission estimates, whichever is lower. That is, the reduction is calculated as follows: (i) For 2010, the difference between the lower of historical baseline or 2010 baseline emissions estimates and the 2010 controlled emissions estimates, minus any emissions that may shift to other sources rather than be eliminated; and (ii) for 2015, the difference between the lower of historical baseline or 2015 baseline emissions estimates and the 2015 controlled emissions estimates, minus any emissions that may shift to other sources rather than be eliminated.

4. Controls on Non-EGUs Only

Although we stated that we believe it is unlikely States may choose to control only non-EGUs, we proposed in the CAIR SNPR provisions for determining

NMED Exhibit 7f

the specified emissions reductions that must be obtained if States pursue this alternative, and we adopt those provisions today. The reason we think it is unlikely is based on States' emissions profiles. Most SO_2 emissions are from EGUs and therefore it is unlikely that a State can achieve the required emissions reductions without regulating EGUs to some degree. In addition, SO_2 emissions reductions from EGUs are highly cost effective. States that choose this path must ensure that the amount of non-EGU reductions is equivalent to all of the emissions reductions that would have been required from EGUs had the State chosen to assign all the emissions reductions to EGUs. For SO_2 emissions, this amount in 2010 would be 50 percent of a State's title IV SO_2 allocations for all units in the State and, for 2015, 65 percent of such allocations. For NO_X emissions, this amount would be the difference between a State's EGU budget for NO_X under the CAIR and its NO_X baseline EGU emissions inventory as projected in the Integrated Planning Model (IPM) for 2010 and 2015, respectively.[112]

In addition, the same requirements described elsewhere in this part of today's preamble regarding the eligibility of non-EGU reductions, emissions control and monitoring, emissions inventories and demonstration of reductions, will apply to the situation where a State chooses to control only non-EGUs.

5. Use of Banked Allowances and the Compliance Supplement Pool

In the CAIR NPR, EPA stated that States may allow EGUs to demonstrate compliance with the State EGU SO_2 budget by using title IV allowances (i) that were banked, or (ii) that were obtained in the current year from sources in other States (69 FR 4627). The EPA adopts this provision in today's action. The EPA adopts a similar provision for the use of banked NO_X SIP Call allowances (pre-2009) to demonstrate compliance with the State EGU ozone season NO_X budget. See also the CAIR NPR (69 FR 4633). Therefore, State rules may allow the use of pre-2010 title IV and pre-2009 NO_X SIP Call allowances banked in the title IV and NO_X SIP Call trading programs for compliance in the CAIR. States participating in the EPA-administered CAIR trading programs must allow the use of these pre-2010 title IV allowances or pre-2009 NO_X SIP Call allowances in accordance with EPA's model trading rules.

Additionally, States with annual NO_X reduction requirements may use compliance supplement pool (CSP) allowances as described in sections V and VIII. Distribution of the CSP is essentially the same as the process used in the NO_X SIP Call, through one or both of two mechanisms. States may distribute CSP allowances on a pro-rata basis to sources that implement NO_X control measures resulting in reductions in 2007 or 2008 that are beyond what is required by any applicable State or Federal emissions limitation (early reductions). The second CSP distribution mechanism that a State can use is to issue CSP allowances based on the demonstration of a need for an extension of the 2009 deadline for implementing emission controls. The demonstration must show unacceptable risk either to a source's own operation or its associated industry—for EGUs, power supply reliability, for non-EGUs risk comparable to that described for the electricity industry. See also 63 FR 57356 for further discussion of these points.

Pre-2010 title IV SO_2 allowances, pre-2009 NO_X SIP Call allowances and CAIR annual NO_X CSP allowances can all be counted toward a States efforts to achieve its CAIR reduction obligations regardless of whether the CAIR trading programs are used or not.

B. State Implementation Plan Schedules

1. State Implementation Plan Submission Schedule

In the NPR, we proposed to require States to submit SIPs to address interstate transport in accordance with the provisions of this rule approximately 18 months from the date of this final rule (69 FR 4624). After careful consideration of the comments we received concerning this issue, we have concluded that States should submit SIPs to satisfy this final rule as expeditiously as possible, but no later than 18 months from the date of today's action. Under this schedule, upwind States' transport SIPs to meet CAA section 110(a)(2)(D) will be due before the downwind States' $PM_{2.5}$ and 8-hour ozone nonattainment area SIPs under CAA section 172(b). We expect that the downwind States' 8-hour ozone nonattainment area SIPs will be due by June 15, 2007, and their $PM_{2.5}$ nonattainment SIPs will be due by April 5, 2008.[113]

We believe that this sequence for SIP submissions to address upwind interstate transport and downwind nonattainment areas is consistent both with the applicable provisions of the CAA and with sound policy objectives. The CAA provides for this sequence of submissions in section 110(a)(1) and (a)(2), which provide that the submittal period for SIPs required by section 110(a)(2)(D) runs from the earlier date of the NAAQS revision, and in section 172(b), which provides that the submittal period for the nonattainment area SIPs runs from the later date of designation. Clean Air Act section 110(a)(1) requires each State to submit a SIP to EPA "within 3 years * * * after the promulgation of a [NAAQS] (or any revision thereof)." Section 110(a)(2) makes clear that this SIP must include, among other things, provisions to address the requirements of section 110(a)(2)(D). We read these provisions together to require that each upwind State must submit, within 3 years of a new or revised NAAQS, SIPs that address the section 110(a)(2)(D) requirement. By contrast, the schedule provided in section 172(b) is only applicable to the nonattainment area SIP requirements.

Section 110(a) imposes the obligation upon States to make a submission, but the contents of that submission may vary depending on the facts and circumstances. In particular, the data and analytical tools available at the time the section 110(a)(2)(D) SIP is developed and submitted to EPA necessarily affect the content of the submission. Where, as here, the data and analytical tools to identify a significant contribution from upwind States to nonattainment areas in downwind States are available, the State's SIP submission must address the existence of the contribution and the emission reductions necessary to eliminate the significant contribution. In other circumstances, however, the tools and information may not be available. In such circumstances, the section 110(a)(2)(D) SIP submission should indicate that the necessary information is not available at the time the submission is made or that, based on the information available, the State believes that no significant contribution to downwind nonattainment exists. EPA can always act at a later time after the initial section 110(a)(2)(D) submissions to issue a SIP call under section 110(k)(5) to States to revise their SIPs to provide for additional emission controls to satisfy the section 110(a)(2)(D) obligations if such action were

[112] See "Technical Support Document for the Clean Air Interstate Rule Notice of Final Rulemaking; Regional and State SO_2 and NO_X Emissions Budgets" for tables containing information to calculate these amounts for both SO_2 and NO_X.

[113] By statute, the date for submission of nonattainment area SIPs is to be no later than 3 years from the date of nonattainment designation. Section 172(b).

NMED Exhibit 7f

warranted based upon subsequently-available data and analyses. This is precisely the circumstance that was presented at the time of the NO_X SIP Call in 1998 when EPA issued a section 110(k)(5) SIP call to states regarding their section 110(a)(2)(D) obligations on the basis of new information that was developed years after the States' SIPs had been previously approved as satisfying section 110(a)(2)(D) without providing for additional controls since the information available at the earlier point in time did not indicate the need for such additional controls.

Not only is this sequencing consistent with the CAA, it is consistent with sound policy considerations. The upwind reductions required by today's action will facilitate attainment planning by the States affected by transport downwind. Rather than being ''premature'' as some commenters suggested, EPA's understanding of the data and models leads the Agency to believe that requiring the States to address the upwind transport contribution to downwind nonattainment earlier in the process as a first step is a reasonable approach and is fully consistent with the statutory structure. This approach will allow downwind States to develop SIPs that address their share of emissions with knowledge of what measures upwind States will have adopted. In addition, most of the downwind States that will benefit by today's rulemaking are themselves significant contributors to violations of the standards further downwind and, thus, are subject to the same requirements as the States further upwind. The reductions these downwind States must implement due to their additional role as upwind States will help reduce their own $PM_{2.5}$ and 8-hour ozone problems on the same schedule as emissions reductions for the upwind States. We believe that providing 18 months from the date of today's action for States to submit the transport SIPs required by this rule is appropriate and reasonable, for the reasons discussed more fully below.

a. The EPA's Authority To Require Section 110(a)(2)(D) Submissions in Accordance With the Schedule of Section 110(a)(1)

A number of commenters objected to EPA's proposal to require States to submit the transport SIPs on the schedule set forth in section 110(a)(1). The commenters argued that section 110(a)(1) does not apply to the requirements of section 110(a)(2)(D), because the former refers to plans that States must adopt ''to implement, maintain, and enforce'' the NAAQS ''within'' the State, whereas the latter refers to plans that prevent emissions that affect nonattainment or maintenance of the NAAQS in places outside the State. According to the commenters, because section 110(a)(1) SIPs purportedly need not address the interstate transport issues governed by section 110(a)(2)(D), the States have no current obligation to prevent such interstate transport and, by extension, there is no basis for the CAIR at this time.

The EPA disagrees with the commenters. A State's SIP must of course provide for ''implementation, maintenance, and enforcement'' of the NAAQS ''within'' the State because States lack authority to impose requirements on sources in other States; *i.e.*, any plan submitted by a State will necessarily be applicable to sources ''within'' that State. The CAA, however, also requires that such SIPs must be submitted to EPA no later than three years after promulgation of a new or revised NAAQS and must contain adequate provisions regarding interstate transport from emission sources within the State in compliance with section 110(a)(2)(D). The explicit terms of the statute provide for the State submission of initial SIPs after promulgation of a new NAAQS, and provide that such SIPs should address interstate transport. Section 110(a)(1) provides that:

> [e]ach State shall * * * adopt and submit to the Administrator, within 3 years (or such shorter period as the Administrator may prescribe) after the promulgation of a national primary ambient air quality standard (or any revision thereof) * * * a plan which provides for implementation, maintenance, and enforcement of such primary standard in each [area] within such State.

Section 110(a)(2) provides, in relevant part, that:

> [e]ach implementation plan submitted by a State under this Act shall be adopted by the State after reasonable notice and public hearing. Each such plan shall * * * (D) contain adequate provisions—(i) prohibiting * * * any source or other type of emissions activity within the State from emitting any air pollutant in amounts which will—(I) contribute significantly to nonattainment in, or interfere with maintenance by, any other State with respect to [the NAAQS].

By referencing each implementation plan in section 110(a)(2), it is clear that the implementation plans required under section 110(a)(1) must satisfy the requirements of section 110(a)(2)(D). Thus, the plain meaning of these provisions, read together, is that SIP submissions are required within 3 years of promulgation of a new or revised NAAQS, and that the SIP submissions must meet the requirements of section 110(a)(2)(D).

By contrast, other requirements of section 110(a)(2) are not triggered by EPA's promulgation of a new or revised NAAQS, but rather by EPA's final designation of nonattainment areas. For example, section 110(a)(2)(I) by its terms indicates that State SIPs must meet that requirement not on the schedule of section 110(a)(1), but instead on the schedule of section 172(b).

The explicit distinction in the statute between requirements that States must meet on the schedule of section 110(a)(1) versus the schedule of section 172(b) reinforces the conclusion that States are to meet the initial requirements of section 110(a)(2)(D) within the schedule of section 110(a)(1).

In this context, it is important to note that the requirements of section 110(a)(1) plans are not limited to areas designated attainment, nonattainment, or unclassifiable.[114] Section 110(a)(1) requires each State to develop and submit a plan that provides for the implementation, maintenance, and enforcement of the NAAQS in ''each'' area of the State. Similarly, the requirement in section 110(a)(2)(D) that SIPs must prohibit interstate transport of air pollutants that significantly contribute to downwind nonattainment is not limited to any particular category of formally designated areas in the State. The provisions apply to emissions activities that occur anywhere in a state, regardless of its designation. If, as the commenters suggested, the requirements of section 110(a)(2)(D) plans are governed not by section 110(a)(1), but rather by the schedule of section 172, that would lead to the absurd result that upwind States need only reduce emissions from designated nonattainment areas to prevent significant contribution to nonattainment or interference with maintenance in a downwind State. Given that large portions of many upwind States may be designated as attainment for the NAAQS for local purposes, yet still contain large sources of emissions that affect downwind States through interstate transport, EPA believes that Congress could not have intended the prohibitions of section 110(a)(2)(D) to apply only to nonattainment areas in upwind States.[115] Indeed, the language of

[114] Under section 107(d), EPA is required to identify all areas of each State as falling into one of these three categories.

[115] The EPA notes that under the provisions of section 107(d), certain portions of an upwind State that are monitoring attainment may be designated nonattainment because they contribute to violations of the NAAQS in a ''nearby'' area. Nevertheless,

NMED Exhibit 7f

section 110(a)(2) itself does not support such an interpretation. Therefore, the alternative schedule provided in section 172(b) applicable only to nonattainment areas cannot be the schedule that governs the State submission of transport SIPs. This leaves the schedule of section 110(a)(1) as the only appropriate schedule in the case of SIPs following EPA promulgation of new or revised NAAQS.

The commenters also disputed that the schedule of section 110(a)(1) applies to the section 110(a)(2)(D) requirement because there are other elements of section 110(a)(2) that States could not meet on that schedule. As an example, the commenters pointed to section 110(a)(2)(I) which requires States to meet certain obligations imposed upon designated nonattainment areas. As formal designation under the generally applicable provisions of section 107(d) could take up to 3 years following promulgation of a new or revised NAAQS, and section 172(b) allows up to 3 additional years for State submission of nonattainment area SIPs, the commenters concluded that States could not meet section 110(a)(2)(I) on the schedule of section 110(a)(1). From the fact that States could not meet all of the elements of the section 110(a)(2) requirement within 3 years, the commenters inferred that EPA cannot require States to meet any of the requirements in section 110(a)(2), including section 110(a)(2)(D).

The EPA disagrees with the commenters' approach to the interpretation of the statute. The EPA agrees that there are certain provisions of section 110(a)(2) that are governed not by the schedule of section 110(a)(1), but instead by the timing requirement of section 172(b), *e.g.*, section 110(a)(2)(I). Other items in section 110(a)(2), however, do not depend upon prior designations in order for States to develop a SIP to begin to comply with them, *e.g.*, section 110(a)(2)(B) (pertaining to monitoring); section 110(a)(2)(E) (stipulating that States must provide for adequate resources); and section 110(a)(2)(K) (pertaining to modeling).

Most important, section 110(a)(2)(D) itself does not apply only to impacts on downwind nonattainment areas, and thus does not presuppose prior designations in either upwind or downwind States, or suggest that section 110(a)(2)(D) is somehow inapplicable until the submission of nonattainment area plans. By its explicit terms, section 110(a)(2)(D) requires States to prohibit emissions from ''any source or other types of emissions activity within the State'' that ''contribute to nonattainment in, or interfere with maintenance by'' any other State. A plain reading of the statute indicates that the emissions at issue can emanate from any portion of an upwind State and that the impacts of concern can occur in any portion of the downwind State.

While EPA agrees that there is overlap between the submission requirements of sections 110(a)(1) and (a)(2) and section 172(c), EPA believes that the plain language of these sections requires States to submit plans that comply with section 110(a)(2)(D) prior to the deadline for nonattainment area SIPs established by section 172, and that there is nothing that compels a contrary conclusion in the language of section 172. Section 172(b) provides that State plans for nonattainment areas must meet ''*the applicable* requirements of [section 172(c)] and section 110(a)(2)'' (emphasis added). Thus, the statute itself explicitly indicates that the State submissions for nonattainment plans must meet those requirements of section 110(a)(2) that are ''applicable,'' not each requirement regardless of applicability. In the current situation, EPA believes that it is appropriate to view the CAA as requiring States to make a submission to meet the requirement of section 110(a)(2)(D) in accordance with the schedule of section 110(a)(1), rather than under the schedule for nonattainment SIPs in section 172(b).[116]

b. The EPA's Authority To Require Section 110(a)(2)(D) Submissions Prior to Formal Designation of Nonattainment Areas Under Section 107

A number of commenters argued that EPA has no authority to require States to comply with section 110(a)(2)(D) until after EPA formally designates nonattainment areas for the $PM_{2.5}$ and 8-hour ozone NAAQS.[117] These commenters claimed that section 107(d) and provisions of the Transportation Equity Act for the 21st Century (TEA–21) governing the designation of $PM_{2.5}$ and 8-hour ozone nonattainment areas preclude EPA from interpreting the CAA to require States to submit SIPs that comply with section 110(a)(2)(D) on the schedule contemplated by section 110(a)(1). In the view of the commenters, EPA could not reasonably expect States to determine whether and to what extent their in-State sources significantly contributed to nonattainment in other States within the initial 3-year timeframe, in advance of nonattainment area designations. According to the commenters, section 107(d) and TEA–21 negate the timing requirements of section 110(a)(1), so that States have no current obligation to address interstate transport and thus there is no basis for today's action.

The EPA disagrees with the commenters' view of the interaction of section 110 and section 107(d). The statute does not require EPA to have completed the designations process before the Agency or a State could assess the existence of, or extent of, significant contribution from one State to another. In addition, the technical approach by which EPA determines significant contribution from upwind to downwind States does not depend upon the prior completion of the designation process.

The EPA believes that the statute does not compel the conclusion that States may postpone compliance with section 110(a)(2)(D) until some future point after completion of the designation process. As discussed above, a reading of the plain language of sections 110(a)(1) and 110(a)(2) indicates that States must adopt and submit a plan to EPA within 3 years after promulgation of a new or revised NAAQS (the same time at which designations are generally due under section 107), and that each

there will be portions of upwind States that include emissions sources that are not in designated nonattainment areas, whether because of local monitored nonattainment, or because of contribution to a nearby nonattainment area, yet these portions of the upwind State may contain sources that cause emissions that States must address to meet the requirements of section 110(a)(2)(D).

[116] As noted earlier, what will be needed to meet section 110(a)(2) may vary, depending upon the specific facts and circumstances surrounding a new or revised NAAQS. *See, e.g., Proposed Requirements for Implementation Plans and Ambient Air Quality Surveillance for Sulfur Oxides (Sulfur Dioxide) National Ambient Air Quality Standard*, 60 FR 12492, 12505 (March 7, 1995). In the context of a proposed 5-minute NAAQS for SO_2, EPA tentatively concluded that existing SIP provisions for the 24-hour and annual SO_2 NAAQS were probably sufficient to meet many elements of section 110(a)(2). The EPA did not explicitly discuss State obligations under section 110(a)(2)(D) for the 5-minute NAAQS in the proposal, but the nature of the pollutant, the sources, and the proposed NAAQS are such that interstate transport would not have been the critical regionwide concern that it is for the $PM_{2.5}$ and 8-hour ozone NAAQS. The EPA does not expect States to make SIP submissions establishing emission controls for the purpose of addressing interstate transport without having adequate information available to them.

[117] The EPA notes that the 8-hour ozone designations became effective on June 15, 2004, and that the $PM_{2.5}$ designations will become effective on April 5, 2005. The EPA believes that the issue raised by the commenters is thus moot with respect to both the 8-hour ozone and $PM_{2.5}$ nonattainment areas because those designations are now complete.

NMED Exhibit 7f

such plan must meet the applicable requirements of section 110(a)(2)(D).[118]

Significantly, neither section 110(a)(1) nor section 110(a)(2)(D) are limited to ''nonattainment'' areas. By their explicit terms, both provisions apply to all areas within the State, regardless of whether EPA has formally designated the areas as attainment, nonattainment, or unclassifiable, pursuant to section 107(d). As to causes, section 110(a)(2)(D) compels States to address any ''emissions activity within the State,'' not solely emissions from formally designated nonattainment areas, nor does it in any other terms suggest that designations of upwind areas must first have occurred. As to impacts, section 110(a)(2)(D) refers only to prevention of ''nonattainment'' in other States, not to prevention of nonattainment in designated nonattainment areas or any similar formulation requiring that designations for downwind nonattainment areas must first have occurred. By comparison, other provisions of the CAA do clearly indicate when they are applicable to designated nonattainment areas, rather than simply to nonattainment more generally (*e.g.*, sections 107(d)(1)(A)(i), 181(b)(2)(A), and 211(k)(10)(D)). Because section 110(a)(2)(D) refers only to ''nonattainment,'' not to ''nonattainment areas,'' EPA concludes that the section does not presuppose the existence of formally designated nonattainment areas, but rather to ambient air quality that does not attain the NAAQS.

The EPA believes that this plain reading of the provisions is also the most logical approach. A reading that section 110(a)(2)(D) means that States have no obligation to address interstate transport unless and until there are formally designated nonattainment areas pursuant to section 107 would be inconsistent with the larger goal of the CAA to encourage expeditious attainment of the NAAQS. In this immediate instance, currently available air quality monitoring data and modeling make it clear that many areas of the eastern portion of the country are in violation of both the $PM_{2.5}$ and 8-hour ozone NAAQS. Air quality modeling studies generally available to the States demonstrate that, and quantify the extent to which, SO_2 and NO_X emissions from sources in upwind States are contributing to violations of the $PM_{2.5}$ and 8-hour ozone NAAQS in downwind States.

Following the example of the NO_X SIP Call, EPA has an effective analytical approach to determine whether that interstate contribution is significant, in accordance with section 110(a)(2)(D). Thus, EPA currently has the information and tools that it needs to determine what the initial $PM_{2.5}$ and 8-hour ozone SIPs from upwind States should include as appropriate NO_X and SO_2 emissions reductions in order to prevent emissions that significantly contribute to nonattainment in downwind States. The designation process under section 107 is the means by which States and EPA decide the precise boundaries of the nonattainment areas in the downwind States. Both $PM_{2.5}$ and ozone are regional phenomena, however, and information as to the precise boundaries of nonattainment areas is not necessary to implement the requirements of section 110(a)(2)(D) for these pollutants. Consequently, it was not necessary for EPA to wait until after completion of formal designation of nonattainment area boundaries before undertaking this rulemaking. Moreover, EPA believes that taking action now will achieve public health protections more quickly as it will enable States to develop implementation plans more expeditiously and efficiently.

The EPA disagrees with the commenters' view of the relationship between section 110(a)(2) and section 107 and their apparent view of the method by which EPA analyzes whether there is a contribution from an upwind State to a downwind State, and whether that contribution is significant.

The EPA has, in this case, used the detailed data from the extensive network of air quality monitors to identify which States have monitors that are currently showing violations of the $PM_{2.5}$ and 8-hour ozone NAAQS. In the NPR, EPA stated that based upon data for the 3-year period from 2000–2002, ''120 counties with *monitors* exceed the annual $PM_{2.5}$ NAAQS and 297 counties with *monitor* readings exceed the 8-hour ozone NAAQS'' (69 FR 4566, 4581; January 30, 2004) (emphasis added). The geographic distribution of monitors with data registering current violations indicated that there is nonattainment of both the $PM_{2.5}$ and 8-hour ozone NAAQS throughout the eastern United States and in other portions of the country including California. For analyses of future ambient conditions, EPA used various modeling tools to predict that, in the absence of the CAIR, there would be counties with monitors that would continue to show violations of the $PM_{2.5}$ and 8-hour ozone NAAQS in 2010 and 2015. In subsequent steps, EPA analyzed whether the emissions from upwind States contributed to the ambient conditions at the monitors registering NAAQS violations in downwind States, and thereafter determined whether that contribution would be significant pursuant to section 110(a)(2)(D).

In none of these steps, however, did EPA need to know the precise boundaries of the nonattainment areas that may ultimately result from the section 107 designation process. The determination of attainment status in a given county is based primarily upon the monitored ambient measurements of the applicable pollutant in the county. Thus, it is the readings at the monitors that are the appropriate information for EPA to evaluate in assessing current and future interstate transport at that monitor in that county, not the exact dimensions of the area that may ultimately comprise the formally designated nonattainment area. The ultimate size of nonattainment areas will have a bearing on other components of the State's nonattainment area SIP. The size of such nonattainment areas, however, is not meaningful in assessing whether interstate transport from another State or States has an impact at a violating monitor, and whether the transport significantly contributes to nonattainment, that the other State or States should address to comply with section 110(a)(2)(D). Thus, EPA believes that basing the significant contribution analysis upon the counties with monitors that register nonattainment, without regard to the precise boundaries of the nonattainment areas that may ultimately result from the formal designation process under section 107, is the proper approach.

For similar reasons, EPA also disagrees with the commenters' assertion that the provisions of TEA–21 preclude EPA's interpretation of the timing requirements of sections 110(a)(1) and 110(a)(2). However, TEA–21 did address the need to create a new network of monitors to assess the geographic scope and location of $PM_{2.5}$ nonattainment. Also, TEA–21 did provide that such a network should be up and running by December 31, 1999. TEA–21 did lay out a schedule for the collection of data over a period of 3 years in order to make subsequent regulatory decisions. From these facts, the commenters concluded that TEA–21 necessarily contradicts EPA's position that States must now take action to address significant contribution to downwind nonattainment in their

[118] For reasons discussed in more detail above, EPA interprets the requirement of section 110(a)(2)(D) to be among those that Congress intended States to meet within the 3-year timeframe of section 110(a)(1). The EPA agrees that other requirements, such as those of section 110(a)(2)(I), are subject to the different timing requirements of section 172(b).

NMED Exhibit 7f

initial section 110(a)(1) SIPs, merely because the initial 3-year period following the promulgation of a new or revised NAAQS specified in section 110(a)(1) has expired.

The EPA believes that nothing in TEA–21 explicitly or implicitly altered the timing requirements of section 110(a)(1) for compliance with section 110(a)(2)(D), although EPA recognizes that the data from monitoring funded by that Act contributed to the Agency's development of the SIP requirements in today's rulemaking. The provisions of TEA–21 pertained to the installation of a network of monitors for $PM_{2.5}$, and to the timing of designation decisions for $PM_{2.5}$ and 8-hour ozone. To be specific, TEA–21 had two primary purposes for the new NAAQS: (1) To gather information ''for use in the determination of area attainment or nonattainment designations'' for the $PM_{2.5}$ NAAQS; and (2) to ensure that States had adequate time to consider guidance from EPA concerning ''drawing area boundaries prior to submitting area designations'' for the 8-hour ozone NAAQS. TEA–21 sections 6101(b)(1) and (2). The EPA interprets the third stated purpose of TEA–21 to refer to ensuring consistency of timing between the Regional Haze program requirements and the $PM_{2.5}$ NAAQS requirements. With respect to timing, TEA–21 similarly only referred to the dates by which States and EPA should take their respective actions concerning designations. For $PM_{2.5}$, TEA–21 provided that States were required ''to submit designations referred to in section 107(d)(1) * * * within 1 year after receipt of 3 years of air quality monitoring data.'' TEA–21 section 6102(c)(1). For 8-hour ozone, TEA–21 required States to submit designation recommendations within 2 years after the promulgation of the new NAAQS, and required EPA to make final designations within 1 year after that (TEA–21 sections 6103(a) and (b)). In all of these provisions, TEA–21 only addresses SIP timing in the context of the designation process of section 107(d). As explained in more detail above, EPA does not believe that the timing of section 110(a)(1) and section 110(a)(2)(D) obligations depend upon the prior designation of areas in accordance with section 107(d).

The EPA also notes that legislation subsequent to TEA–21 further supports this conclusion. In the 2004 Consolidated Appropriations Act, Congress further amended section 107 to provide specific dates by which States and EPA must make $PM_{2.5}$ designations. 42 U.S.C. 7407 note. The Act now requires States to have made their initial recommendations for $PM_{2.5}$ designations by February 15, 2004, and requires EPA to take action on those recommendations and make its final designation decisions no later than December 31, 2004. Again, these requirements pertain only to formal designations, and do not directly affect the obligations of States to meet other SIP requirements. Neither TEA–21 nor the 2004 Appropriations Act language altered the section 110(a)(1) schedule for compliance with section 110(a)(2)(D).

The commenters suggested that because Congress provided more time for making formal designations pursuant to section 107, it necessarily follows that States should not have to meet the requirements of section 110(a)(2)(D) on the schedule of section 110(a)(1). The EPA believes that Congress did not, through TEA–21 or other actions, alter the existing submission schedule for SIPs to address interstate transport. By contrast, Congress did explicitly alter the schedule for submission of plan revisions to address Regional Haze. From this, EPA infers that Congress did not intend EPA to delay action to address the issue of interstate transport for the 8-hour or $PM_{2.5}$ NAAQS. Thus, EPA must still ensure that States submit SIPs in accordance with the substantive requirements of section 110(a)(2)(D). However, because EPA and the States now have the data and analyses to establish the presence and magnitude of interstate transport, in part through the monitoring data gathered pursuant to TEA–21, the Agency believes that that it is now appropriate to require States to address interstate transport at this time in the manner set forth in today's rule.

c. The EPA's Authority To Require Section 110(a)(2)(D) Submissions Prior to State Submission of Nonattainment Area Plans Under Section 172

Some commenters suggested that EPA cannot determine the existence of a significant contribution from upwind States to downwind States until EPA actually receives the nonattainment area SIPs from each State and evaluates how much ''residual'' nonattainment remains. If the reasoning of these commenters were adopted, downwind States would have to construct SIPs to attain the NAAQS without first knowing what upwind States might ultimately do to reduce interstate transport. Presumably, the theory is that the downwind States may choose to control their own local emissions sources more aggressively so that sources in upwind States could avoid installation of highly cost-effective emission controls, notwithstanding the continued significant impacts of emissions from upwind sources on downwind States. Alternatively, the rationale may be that EPA should wait until submission of upwind State nonattainment area SIPs to discover whether and to what degree the SIPs address interstate transport to downwind States.

For reasons already discussed more fully above, EPA does not believe that the statute requires a ''wait and see'' approach to discover what, if anything, States may ultimately do to address the problem of regional interstate transport. Section 110(a)(1) requires ''each'' State to submit a SIP within 3 years after a new or revised NAAQS addressing the requirements of section 110(a)(2)(D). When the data and the analyses needed to establish the existence of interstate transport of pollutants and to determine whether there is a significant contribution to nonattainment or interference with maintenance by one State in another State are available, as here after the monitoring funded by TEA–21, EPA believes that it may act upon that information prior to State SIP submissions to ensure that States address such contribution expeditiously, as it is doing in this rulemaking. The EPA believes it is a better policy to assist the States to address the regional component of the nonattainment problem in a way that is equitable, timely, cost effective, and certain.

The EPA acknowledges that historically, especially in the case of 1-hour ozone, the Agency has not had the data and the analytical tools to help upwind States to address interstate transport as early in the SIP process as it is doing today for $PM_{2.5}$ and 8-hour ozone. The CAA has required States to regulate ozone or its regulatory predecessors since 1970. For many years, States and EPA focused on the adoption and implementation of local controls to bring local nonattainment areas into attainment. Thus, historically, local areas bore the burden of achieving attainment through imposition of control measures on local sources. By comparison, upwind States did not have to adopt local controls in attainment areas and typically did not adopt such controls solely to lessen the impact of their emissions on downwind States. Since 1977, the CAA has also imposed a series of local control obligations on 1-hour ozone nonattainment areas, such as RACT for stationary sources, inspection and maintenance for mobile sources, and other requirements that became increasingly more stringent, based upon the level of local nonattainment. In spite of these local control efforts, there continued to be a

NMED Exhibit 7f

widespread problem with nonattainment that resulted, in part, from unaddressed interstate transport. A lack of information and analytical tools hindered the ability of EPA and the States to address the regional interstate transport component of 1-hour ozone nonattainment, until the NO_X SIP Call in 1998. While it is thus true that the NO_X SIP Call postdated the submission of nonattainment area SIPs, this should not be construed as evidence that the statute precludes the States and EPA from addressing interstate transport earlier in the process for the 8-hour ozone and $PM_{2.5}$ NAAQS.

Given that EPA and the States indisputably have the requisite information to identify interstate transport at this stage of SIP development, EPA believes, based upon its experience in implementing the 1-hour ozone NAAQS, that it is preferable to take action under section 110(a)(2)(D) to address the regional transport component of the $PM_{2.5}$ and 8-hour ozone nonattainment problem. States, both upwind and downwind, will still have an obligation to control emissions from sources within their boundaries for the purposes of local area attainment and maintenance of the NAAQS. The EPA does not believe, however, that it is either required by the statute, or in accordance with sound policy, for the Agency to wait until submission of the nonattainment area SIPs of downwind States to discover whether or not those SIPs will control local sources sufficiently to provide for eventual attainment regardless of continued significant contribution through interstate transport from upwind States. To the contrary, past experience with the 1-hour ozone NAAQS has demonstrated that delayed action to address the interstate component of nonattainment will potentially lead to delays in attainment as downwind areas struggle to overcome the impacts of transport. Indeed, a number of scientific and technical assessments of ozone and $PM_{2.5}$ by the NRC and the Ozone Transport Assessment Group have identified addressing interstate transport as a critical issue in developing SIPs.

d. The EPA's Authority To Require Section 110(a)(2)(D) Submissions Prior to Completion of the Next Review of the $PM_{2.5}$ and 8-Hour Ozone NAAQS

Commenters also asserted that EPA should not take any action to implement the 8-hour ozone and $PM_{2.5}$ NAAQS, until completion of the next NAAQS review cycle. According to the commenters, a series of statements by EPA and others indicated an intention to take no action to implement the NAAQS until after the next review cycle, and that statutes passed by Congress confirm that EPA is to take no such action.

The EPA disagrees with the assertion that it should take no action to implement the 1997 $PM_{2.5}$ and 8-hour ozone NAAQS until completion of the next NAAQS review. Section 110(a) explicitly requires States to begin to submit SIPS within 3 years after promulgation of a new or revised NAAQS. The CAA also requires EPA to take action upon State SIP submissions within specific timeframes. States are likewise explicitly obligated to attain existing NAAQS within certain specified timeframes. None of these basic statutory submission, review, or attainment obligations are stayed or delayed due to the fact that there may be an ongoing NAAQS review cycle. Indeed, under section 109, EPA is to review all NAAQS on an ongoing basis, every 5 years. If the mere existence of a NAAQS review cycle were grounds to suspend implementation of a NAAQS, it would undermine the very goals of the statute.

The commenters argued that certain statements made by EPA and others in guidance memoranda and elsewhere preclude EPA from taking any action to implement the $PM_{2.5}$ and 8-hour ozone NAAQS. The EPA believes that the commenters are misconstruing those statements, and that the statements merely reflect the Agency's assumption that the NAAQS review cycle would occur on the normal schedule. It would be nonsensical to suggest that, if for any reason, the NAAQS review cycle were delayed, that the CAA would permit no implementation of the existing NAAQS. Such an approach would invite and encourage inappropriate interference in the NAAQS review cycle as a means of subverting the CAA.

The commenters further argued that Congress has taken action to prevent implementation of the 8-hour ozone and $PM_{2.5}$ NAAQS pending the next NAAQS review cycle. The EPA does not see any such intention on the part of Congress. In TEA–21 and the 2004 Consolidated Appropriations Act, Congress has amended section 107 to provide specific dates by which States and EPA must make designations. Significantly, Congress did not alter the existing statute with respect to any other deadlines for SIP submissions, or with respect to implementation of the $PM_{2.5}$ and 8-hour ozone NAAQS generally. By contrast, in the 2004 Consolidated Appropriations Act, Congress did explicitly alter the date by which States must submit plan revisions to address Regional Haze. See, Section 7(A), 42 U.S.C. section 7407 note. From this explicit action, one must infer that Congress could have taken action to alter the submission date for plans to address $PM_{2.5}$ or 8-hour ozone, had it intended to alter the existing statutory scheme. Most importantly, however, Congress did not make any of the changes effected in TEA–21 or the 2004 Consolidated Appropriations Act dependent upon completion of the next NAAQS review. To the contrary, Congress directed EPA to take certain actions notwithstanding the fact that there were and are ongoing reviews of the NAAQS. From this, EPA infers that Congress did not intend EPA to defer all action to implement the existing NAAQS, including today's action to assist States to address the requirements of section 110(a)(2)(D).

e. The EPA's Authority To Require States To Make Section 110(a)(2)(D) Submissions Within 18 Months of This Final Rule

Some commenters questioned EPA's proposal to require States to make SIP submissions in response to this action as expeditiously as practicable but no later than within 18 months. A number of commenters suggested that this schedule is too short because of the magnitude or complexity of the task or because of the typical duration of State rulemaking processes. Other commenters suggested that EPA should follow the example of the NO_X SIP Call more closely and provide a shorter period than the Agency proposed.

The EPA has concluded that the proposed 18-month schedule is reasonable given the circumstances and given the scope of the actions that we are requiring States to take. We issued the $PM_{2.5}$ and 8-hour ozone NAAQS revisions in July 1997. More than 3 years have already elapsed since promulgation of the NAAQS, and States have not submitted SIPs to address their section 110(a)(2)(D) obligations under the new NAAQS. We recognize that litigation over the new $PM_{2.5}$ and 8-hour ozone NAAQS created substantial uncertainty as to whether the courts would uphold the new NAAQS, and that this uncertainty, as a practical matter, rendered it more difficult for States to develop SIPs. Moreover, in the case of $PM_{2.5}$, additional time was needed for creation of an adequate monitoring network, collection of at least 3 years of data from that network, and analysis of those data.

In addition, in the NPR, the SNPR, and today's action, we have provided States with a great deal of data and analysis concerning air quality and control costs, as well as policy judgments from EPA concerning the appropriate criteria for determining whether upwind sources contribute significantly to downwind nonattainment under section 110(a)(2)(D). We recognize that States would face great difficulties in developing transport SIPs to meet the requirements of today's action without these data and policies. In light of these factors and the fact that States can no longer meet the original 3-year submittal date of section 110(a)(1), we believe that States need a reasonable period of time in which to comply with the requirements of today's action.

In the comparable NO_X SIP Call rulemaking, EPA provided 12 months for the affected States to submit their SIP revisions. One of the factors that we considered in setting that 12-month period was that upwind States had already, as part of the Ozone Transport Assessment Group process begun 3 years before the NO_X SIP Call rulemaking, been given the opportunity to consider available control options. Because today's action requires affected States to control both SO_2 and NO_X emissions, and to do so for the purpose of addressing both the $PM_{2.5}$ and 8-hour ozone NAAQS, we believe it is reasonable to allow affected States more time than was allotted in the NO_X SIP Call to develop and submit transport SIPs.

Another factor that we have considered is that under section 110(k)(5), the CAA stipulates that EPA may provide up to 18 months for SIP submissions to correct substantially inadequate plans. While today's action is not pursuant to section 110(k)(5), we believe that the provision provides an analogy for the appropriate schedule on which EPA should expect States to make the submission required by today's action. We believe it would not be appropriate to set a longer schedule for submission of the plan than would have been possible under section 110(k)(5) had the States submitted a plan on the original 3-year schedule contemplated in section 110(a)(1) that did not provide for the emissions reductions today's action requires. While the CAA does require States to make some SIP submissions on shorter schedules, we conclude that the complexities of the action required by today's rulemaking militate in favor of a longer schedule.[119]

Finally, we note that by making findings that States have thus far failed to submit SIPs to meet the requirements of section 110(a)(2)(D) for the 8-hour ozone and $PM_{2.5}$ NAAQS, EPA has an obligation to implement a Federal implementation plan (FIP) to address interstate transport no later than 24 months after that finding, if the States fail to take appropriate action. Given this schedule for the FIP obligation, EPA believes that it is reasonable to require States to take action to meet the section 110(a)(2)(D) obligation with respect to the significant contribution identified in today's rule within no more than 18 months. Such a schedule will allow States adequate time to develop submissions to meet this requirement and will afford EPA adequate time to review such submissions before the imposition of a FIP in lieu of a SIP, if necessary.

Thus, EPA has concluded that States should submit SIPs to reduce interstate transport, as required by this final action, as expeditiously as practicable but no later than 18 months from today's date. Such a schedule will provide both upwind and downwind States, and those States that are in both positions relative to other States, to develop SIPs that will facilitate expeditious attainment of the $PM_{2.5}$ and the 8-hour ozone standards.

C. What Happens If a State Fails To Submit a Transport SIP or EPA Disapproves the Submitted SIP?

1. Under What Circumstances Is EPA Required To Promulgate a FIP?

Under section 110(c)(1), EPA is required to promulgate a FIP within 2 years of: (1) finding that a State has failed to make a required submittal; or (2) finding that a submittal received does not satisfy the minimum completeness criteria established under section 110(k)(1)(A) (40 CFR part 51, appendix V); or (3) disapproving a SIP submittal in whole or in part. Section 110(c)(1) mandates that EPA promulgate a FIP unless the States corrects the deficiency and EPA approves the SIP before the time EPA would promulgate the FIP.

2. What Are the Completeness Criteria?

Any SIP submittal that is made with respect to the final CAIR requirements first would be determined to be either incomplete or complete. A finding of completeness is not a determination that the submittal is approvable. Rather, it means the submittal is administratively and technically sufficient for EPA to proceed with its review to determine whether the submittal meets the statutory and regulatory requirements for approval. Under 40 CFR 51.123 and 40 CFR 51.124 (the proposed new regulations for NO_X and SO_2 SIP requirements, respectively), a submittal, to be complete, must meet the criteria described in 40 CFR, part 51, appendix V, ''Criteria for Determining the Completeness of Plan Submissions.'' These criteria apply generally to SIP submissions.

Under CAA section 110(k)(1) and section 1.2 of appendix V, EPA must notify States whether a submittal meets the requirements of appendix V within 60 days of, but no later than 6 months after, EPA's receipt of the submittal. If a completeness determination is not made within 6 months after submission, the submittal is deemed complete by operation of law. For rules submitted in response to the CAIR, EPA intends to make completeness determinations expeditiously.

3. When Would EPA Promulgate the CAIR Transport FIP?

The EPA views seriously its responsibility to address the issue of regional transport of $PM_{2.5}$, ozone, and precursor emissions. Decreases in NO_X and SO_2 emissions are needed in the States named in the CAIR to enable the downwind States to develop and implement plans to achieve the $PM_{2.5}$ and 8-hour ozone NAAQS and provide clean air for their residents. Thus, EPA intends to promulgate the FIP shortly after the CAIR SIP submission deadline for States that fail to submit approvable SIPs in order to help assure that the downwind States realize the air quality benefits of regional NO_X and SO_2 reductions as soon as practicable. This is consistent with Congress' intent that attainment occur in these downwind nonattainment areas ''as expeditiously as practicable'' (sections 181(a),172(a)). To this end, EPA intends to propose the FIP prior to the SIP submission deadline.

The FIP proposal would achieve the NO_X and SO_2 emissions reductions required under the CAIR by requiring EGUs in affected States to reduce emissions through participation in Federal NO_X and SO_2 cap and trade programs. The EPA intends to integrate these Federal trading programs with the model trading programs that States may choose to adopt to meet the CAIR. Although EPA would be proposing FIPs for all States affected by the CAIR, EPA will only issue a final FIP for those jurisdictions that fail to respond adequately to the CAIR.

[119] See, *e.g.,* section 182(a)(2)(A) (providing a 6-month schedule for submission of a revision to provide for RACT corrections); section 189(d) (providing 12 months for submission of plan revisions to ensure attainment and required emissions reductions). The former revision could be relatively limited in scope, but the latter might entail submission of a completely revised SIP.

NMED Exhibit 7f

The EPA's goal is to have approvable SIPs that meet the requirements of the CAIR. We remain ready to work with the States to develop fully approvable SIPs, which would eliminate the need for EPA to promulgate a FIP.

D. What Are the Emissions Reporting Requirements for States?

The EPA believes that it is essential that achievement of the emissions reductions required by the CAIR be verified on a regular basis. Emission reporting is the principal mechanism to verify these reductions and to assure the downwind affected States and EPA that the ozone and $PM_{2.5}$ transport problems are being mitigated as required by the rule. Therefore, the final rule establishes a small set of new emission reporting requirements applicable to States affected by the CAIR, covering certain emissions data not already required under existing emission reporting regulations. The rule language also removes a current emission reporting requirement related to the NO_X SIP call, which we believe is not necessary, for reasons explained below. A number of other proposed changes in emission reporting requirements which would have affected States not subject to the final CAIR are not included in the final rule, for reasons explained below. We will repropose these other changes, with modifications, in a separate proposal to allow additional opportunity for public comment.

1. Purpose and Authority

Because we are consolidating and harmonizing the new emission reporting requirements promulgated today with two pre-existing sets of emission reporting requirements, we review here the purpose and authority for emission reporting requirements in general.

Emissions inventories are critical for the efforts of State, local, and Federal agencies to attain and maintain the NAAQS that EPA has established for criteria pollutants such as ozone, PM, and CO. Pursuant to its authority under sections 110 and 172 of the CAA, EPA has long required SIPs to provide for the submission by States to EPA of emissions inventories containing information regarding the emissions of criteria pollutants and their precursors (*e.g.*, VOCs). The EPA codified these requirements in subpart Q of 40 CFR part 51, in 1979 and amended them in 1987.

The 1990 Amendments to the CAA revised many of the provisions of the CAA related to the attainment of the NAAQS and the protection of visibility in Class I areas. These revisions established new periodic emissions inventory requirements applicable to certain areas that were designated nonattainment for certain pollutants. For example, section 182(a)(3)(A) required States to submit an emissions inventory every 3 years for ozone nonattainment areas beginning in 1993. Similarly, section 187(a)(5) required States to submit an inventory every 3 years for CO nonattainment areas. The EPA, however, did not immediately codify these statutory requirements in the CFR, but simply relied on the statutory language to implement them.

In 1998, EPA promulgated the NO_X SIP call which requires the affected States and the District of Columbia to submit SIP revisions providing for NO_X reductions to reduce their adverse impact on downwind ozone nonattainment areas. (63 FR 57356, October 27, 1998). As part of that rule, codified in 40 CFR 51.122, EPA established emissions reporting requirements to be included in the SIP revisions required under that action.

Another set of emissions reporting requirements, termed the Consolidated Emissions Reporting Rule (CERR), was promulgated by EPA in 2002, and is codified at 40 CFR part 51 subpart A. (67 FR 39602, June 10, 2002). These requirements replaced the requirements previously contained in subpart Q, expanding their geographic and pollutant coverages while simplifying them in other ways.

The principal statutory authority for the emissions inventory reporting requirements outlined in this final rule is found in CAA section 110(a)(2)(F), which provides that SIPs must require ''as may be prescribed by the Administrator * * * (ii) periodic reports on the nature and amounts of emissions and emissions-related data from such sources.'' Section 301(a) of the CAA provides authority for EPA to promulgate regulations under this provision.[120]

2. Pre-existing Emission Reporting Requirements

As noted above, prior to this final rule, two sections of title 40 of the CFR contained emissions reporting requirements that are applicable to States: Subpart A of part 51 (the CERR) and section 51.122 in subpart G of part 51 (the NO_X SIP Call reporting requirements).

[120] Other CAA provisions relevant to this final rule include section 172(c)(3) (provides that SIPs for nonattainment areas must include comprehensive, current inventory of actual emissions, including periodic revisions); section 182(a)(3)(A) (emissions inventories from ozone nonattainment areas); and section 187(a)(5) (emissions inventories from CO nonattainment areas).

Under the NO_X SIP Call requirements in section 51.122, emissions of NO_X for a defined 5-month ozone season (May 1 through September 30) and for work weekday emissions for point, area and mobile sources that the State has subjected to emissions control to comply with the requirements of the NO_X SIP Call, are required to be reported by the affected States to EPA every year. However, emissions of sources reporting directly to EPA as part of the NO_X trading program are not required to be reported by the State to EPA every year. The affected States are also required to report ozone season emissions and typical summer daily emissions of NO_X from all sources every third year (2002, 2005, etc.) and in 2007. This triennial reporting process does not have an exemption for sources participating in the emissions trading programs. Section 51.122 also requires that a number of data elements be reported for each source in addition to ozone season NO_X emissions. These data elements describe certain of the source's physical and operational parameters.

Emissions reporting under the NO_X SIP Call as first promulgated was required starting for the emissions reporting year 2002, the year prior to the start of the required emissions reductions. The reports are due to EPA on December 31 of the calendar year following the inventory year. For example, emissions from all sources and types in the 2002 ozone season were required to be reported on December 31, 2003. However, because the Court which heard challenges to the NO_X SIP Call delayed the implementation by 1 year to 2004, no State was required to start reporting until the 2003 inventory year. The EPA promulgated a rule to subject Georgia and Missouri to the NO_X SIP Call with an implementation date of 2007. (*See* 69 FR 21604, April 21, 2004.) We have recently proposed to stay the NO_X SIP Call for Georgia (*see* 70 FR 9897, March 1, 2005). Missouri's emissions reporting begins with 2006. These emissions reporting requirements under the NO_X SIP Call affect the District of Columbia and 18 of the 28 States affected by the proposed CAIR.

As noted above, the other set of pre-existing emissions reporting requirements is codified at subpart A of part 51. Although entitled the Consolidated Emissions Reporting Rule (CERR), this rule left in place the separate § 51.122 for the NO_X SIP Call reporting. The CERR requirements were aimed at obtaining emissions information to support a broader set of purposes under the CAA than were the reporting requirements under the NO_X

NMED Exhibit 7f

SIP Call. The CERR requirements apply to all States.

Like the requirements under the NO_X SIP Call, the CERR requires reporting of all sources at 3-year intervals (2005, 2008, etc.). It requires reporting of certain large sources every year. However, the required reporting date under the CERR is 5 months later than under the NO_X SIP Call reporting requirements. Also, emissions must be reported for the whole year, for a typical day in winter, and a typical day in summer, but not for the 5-month ozone season as is required by the NO_X SIP Call. Finally, the CERR and the NO_X SIP Call differ in what non-emissions data elements must be reported.

3. Summary of the Proposed Emissions Reporting Requirements

On June 10, 2004, EPA published a SNPR (69 FR 32684) to EPA's January 30, 2004 proposal (69 FR 4566). The EPA's main objective with respect to emissions reporting was to add limited new requirements for emissions reports to serve the additional purposes of verifying the CAIR-required emissions reductions. The SNPR also sought to harmonize the CERR and NO_X SIP Call reporting requirements with respect to specific data elements and consolidate them entirely in subpart A, and to reduce and simplify the reporting requirements in several ways. These latter changes were proposed to be applicable to all States, not just those affected by the CAIR emissions reduction requirements. The major changes included in the SNPR are described below.

Amendments were proposed to subpart A, which contains § 51.1 through 51.45 and an appendix, and to § 51.122. We also proposed to add a new § 51.125.

- In § 51.122, the NO_X SIP Call provisions, we proposed to abolish certain requirements entirely, and to replace certain requirements with a cross reference to subpart A so that detailed lists of required data elements appeared only in subpart A. As proposed, § 51.122 would then have specified what pollutants, sources, and time periods the States subject to the NO_X SIP Call must report and when, but would no longer have listed the detailed data elements required for those reports.
- The proposed new § 51.125 would have been functionally parallel to § 51.122, specifying all the pollutants, sources, and time periods the States subject to the proposed CAIR must report and when, referencing subpart A for the detailed data elements required.
- The proposed amended subpart A would have listed the detailed data elements for all three reporting programs (CERR, NO_X SIP Call, and CAIR) as well as provided information on submittal procedures, definitions, and other generally applicable provisions.

Taken together, the pre-existing emissions reporting requirements under the NO_X SIP Call and CERR were already rather comprehensive in terms of the States covered and the information required. Therefore, the practical impact of the proposed changes would have imposed only three new requirements.

First, in Arkansas, Florida, Iowa, Louisiana, Mississippi, and Wisconsin for which we proposed and are finalizing a finding of significant contribution to ozone nonattainment in another State but which were not among the 22 States already subject to the NO_X SIP Call, the required emissions reporting would be expanded to match those of the 22 States. The proposed change would require that they report NO_X emissions during the 5-month ozone season and for a typical summer day, in addition to the existing requirement for reporting emissions for the full year. We proposed that this new requirement begin with the triennial inventory year prior to the CAIR implementation date. This would be the 2008 inventory year, the report for which would be due to EPA by June 1, 2010.

Second, under the existing CERR, yearly reporting is required only for sources whose emissions exceed specified amounts. The SNPR proposed that the 28 States and the District of Columbia subject to the CAIR for reasons of $PM_{2.5}$ must report to EPA each year a set of specified data elements for all sources subject to new controls adopted specifically to meet the CAIR requirements related to $PM_{2.5}$, unless the sources participate in an EPA-administered emissions trading program. We proposed that this new requirement begin with the 2009 inventory year, the report for which will be due to EPA by June 1, 2011. This new requirement would have no effect on States that fully comply with the CAIR by requiring their EGUs to participate in the CAIR model cap and trade programs.

Third, in all States, we proposed to expand the definition of what sources must report in point source format, so that fewer sources would be included in non-point source emissions.[121] We proposed to base the requirement for point source format reporting on whether the source is a major source under 40 CFR part 70 for the pollutants for which reporting is required, *i.e.,* for CO, VOC, NO_X, SO_2, $PM_{2.5}$, PM_{10} and ammonia but without regard to emissions of hazardous air pollutants.

A number of other proposed changes would have reduced reporting requirements on States or provided them with additional options. Two of the proposed changes in this category are of special note in understanding the final requirements of today's rule. (The remainder of these changes were explained in the SNPR at 69 FR 32697.)

- The NO_X SIP Call rule requires the affected States to submit emissions inventory reports for a given ozone season to EPA by December 31 of the following year. The CERR requires similar but not identical reports from all States by the following June 1, five months later. We proposed to move the December 31 reporting requirement to the following June 1, the more generally applicable submission date affecting all 50 States. We asked for comment on whether allowing this 5-month delay is consistent with the air quality goals served by the emissions reporting requirements. However, we also asked for comment on the alternative of moving forward to December 31 all or part of the June 1 reporting for all 50 States. In particular, we solicited comment on requiring that point sources be reported on December 31 and other sources on June 1.
- We also proposed to eliminate a requirement of the NO_X SIP Call for a special all-sources report by affected States for the year 2007, due December 31, 2008.

4. Summary of Comments Received and EPA's Responses

A number of commenters objected to the 45-day comment period as being too short to allow for full understanding of and comment on the emissions reporting changes that EPA had proposed. With respect to this issue, EPA believes that the comment period was sufficient for those proposed changes that would affect the States subject to the emissions reductions

[121] We used the term ''non-point source'' in the SNPR to refer to a stationary source that is treated for inventory purposes as part of an aggregated source category rather than as an individual facility. In the existing subpart A of part 51, such emissions sources are referred to as ''area sources.'' However, the term ''area source'' is used in section 112 of the CAA to indicate a non-major source of hazardous air pollutants, which could be a point source. As emissions inventory activities increasingly encompass both NAAQS-related pollutants and hazardous air pollutants, the differing uses of ''area source'' can cause confusion. Accordingly, EPA proposed to substitute the term ''non-point source'' for the term ''area source'' in subpart A, § 51.122, and the new § 51.125 to avoid confusion. We are not finalizing this change in terminology in today's rule.

NMED Exhibit 7f

requirements of the CAIR and that are specifically directed at ensuring the effectiveness of the CAIR, namely: (1) The requirement for six more States to report ozone season emissions, and (2) the requirement for all subject States to report annual emissions from controlled sources every year if those sources are not participating in the emission trading programs. These proposed changes are easy to understand on their face, and also have close precedents in the NO_X SIP Call. Moreover, the States affected by these proposed reporting requirements were identified as being subject to the proposed emissions reduction requirements of the CAIR in the original NPR, and thus they knew to be alert to the contents of the SNPR. We also consider the comment period sufficient with respect to two other specific elements of the proposal, namely (3) the proposal to eliminate the 2007 inventory reporting requirement under the NO_X SIP Call and (4) the proposal to change the reporting date for the NO_X SIP Call from December 31 (12 months after the end of the reported year) to June 1 (17 months after the end of the reported year). These were also readily understood proposals, and the States affected by them were among those initially identified as subject to the CAIR itself. A number of substantive comments were received on these four proposed changes. Therefore, we have concluded that it is appropriate to consider the substantive comments that were received on these four elements of the SNPR, and to take final action on them. The disposition of the remaining elements of the SNPR is discussed further below.

The EPA received one comment from the Mississippi Department of Environmental Quality on the proposed requirement that Mississippi and five other States report ozone season emissions. Mississippi disagreed that they should be included with the other States subject to the CAIR provisions, including the emissions reporting provisions. The EPA has concluded that the analysis performed to support CAIR and discussed earlier in this preamble amply demonstrates that Mississippi should be included in the CAIR and subject to the CAIR emissions reporting requirements.

We did not receive comments specifically on the proposal to require States to report annual emissions every year from sources controlled to comply with the CAIR, if those sources are not participating in the emission trading programs operated by EPA. While we expect the number of such sources to be small if not zero, we continue to believe that tracking their emissions from year to year is appropriate, and we are finalizing this requirement. Since the CERR already contains a requirement for every-year reporting of emissions from point sources above certain emission thresholds, this requirement will have an incremental impact only if States choose to control fairly small point sources or nonpoint or mobile sources as part of their plan for meeting the CAIR requirements.

The EPA received several comments regarding the elimination of the NO_X SIP Call special all-sources 2007 emissions inventory. These comments all favored the elimination of the 2007 emissions inventory, which EPA is promulgating in today's rule. We would like to clarify that the NO_X SIP Call contained no requirement that any State make a retrospective demonstration that actual statewide emissions of NO_X were within any limit. The requirement for the 2007 inventory was for the purpose of program evaluation by EPA. As explained in the SNPR, we believe that in light of the data on 2007 emissions that will be available from the NO_X trading program and the further reductions in NO_X required by the CAIR, the 2007 inventory submissions from the States are not needed for this purpose.

The EPA also proposed to harmonize the report due dates for the NO_X SIP Call, currently 12 months after the end of the reported year, and for the CERR, currently 17 months after the end of the reported year. The EPA proposed to harmonize the dates for both at 17 months, but asked for comments on a 12-month due date. Several comments were received, all favoring harmonizing the report due date at 17 months. While we continue to believe in the efficiency advantage of harmonized submission date requirements, we are not finalizing this change. The EPA has reconsidered this part of the proposed emissions reporting requirements and believes that it may be in the interest of the public to move in the direction of shortening the emissions reporting cycle for all three reporting requirements (CERR, NO_X SIP Call, and CAIR), rather than accepting the longer CERR cycle for all three reporting requirements. In today's final rule, we are retaining the 12-month submission date requirement of the original NO_X SIP Call for the States already subject to it. For the six States that are newly subject to reporting ozone season NO_X emissions and for the new requirement for every-year reporting by sources controlled to meet the CAIR requirements for SO_2 and NO_X annual emissions reductions but not included in the trading programs, the required reporting date for States will be June 1, 17 months after the end of the reported year, as was proposed. We will address reporting deadlines comprehensively in a separate NPR which will propose a unified, but shorter period of time to report to EPA. This separate notice will allow for more public comment on the reporting cycle. The dual approach to reporting due dates retained in today's rule will be combined into unified due dates and will be influenced by comments received in response to our proposal when the separate rulemaking is completed.

Regarding elements of the proposed requirements beyond these four, i.e., the requirements that would have affected States not subjected to the CAIR emissions reduction requirements as well as CAIR States, many commenters said that EPA should not have included changes to national emissions reporting requirements in a proposed rule placing emissions reduction requirements on only certain States. Commenters also questioned whether EPA had given adequate time for comment on the more detailed revisions in required data elements, definitions, etc. Substantively, many commenters supported some or all of the proposed changes, but some commenters objected to some of them.

The EPA has considered these comments. Without conceding EPA's legal authority to include these provisions in the final rule in light of the history of proposal, public hearing, and comment period, EPA has—in an abundance of caution—decided to omit these provisions from today's rule (see section VIII.D.5 Summary of the Emissions Reporting Requirements below for the changes which are being finalized today). We will repropose them, with modifications, in a separate NPR to allow additional opportunity for public comment by all affected States and other parties.

5. Summary of the Emissions Reporting Requirements

As a result of the comments received, EPA has revised the emissions reporting requirements of today's rule by limiting new requirements to the ones where sufficient notice and opportunity for comment was clearly given in the June 10, 2004, SNPR and that either: (1) Are necessary for the monitoring of the implementation of the emissions reduction requirements of the CAIR, or (2) are changes in reporting under the NO_X SIP Call linked to the CAIR. Three specific emissions reporting provisions that change the pre-existing requirements are included in today's rule.

NMED Exhibit 7f

1. Alabama, Arkansas, Connecticut, Delaware, Florida, Illinois, Indiana, Iowa, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Mississippi, Missouri, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Virginia, West Virginia, Wisconsin and the District of Columbia, which are subject to the CAIR for reasons of ozone, are made subject to emission reporting requirements for NO_X that are very similar to the existing requirements of the NO_X SIP Call, which already affects all but six of these States. For these six States (Arkansas, Florida, Iowa, Louisiana, Mississippi and Wisconsin) a new requirement is that they report NO_X emissions during the 5-month ozone season from all sources every three years, in addition to reporting emissions for the full year and for a summer day as was already required. This new requirement begins with the triennial inventory year 2008. For all the listed States, a new requirement is to report to EPA for 2009 and each year thereafter the ozone-season and summer day NO_X emissions, plus a set of specified other data elements, for all sources subject to new controls adopted specifically to meet the CAIR requirements related to ozone, unless the sources participate in an EPA-administered emissions trading program. These reports will be due June 1 of the second year following the end of the reported year, *i.e.*, 17 months after the end of the reported year. The existing CERR includes several other reporting requirements which in conjunction with this new requirement will meet the needs for monitoring the implementation of required NO_X emissions reductions.

2. Alabama, Florida, Georgia, Illinois, Indiana, Iowa, Kentucky, Louisiana, Maryland, Michigan, Minnesota, Mississippi, Missouri, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Texas, Virginia, West Virginia, Wisconsin and the District of Columbia, which are subject to the CAIR for reasons of $PM_{2.5}$, must report to EPA each year annual NO_X and SO_2 emissions, plus a set of specified other data elements, for all sources subject to new controls adopted specifically to meet the CAIR requirements related to $PM_{2.5}$, unless the sources participate in an EPA-administered emissions trading program. Previously, these states may have been required to report these sources only every third year, depending on their size. The existing CERR includes several other reporting requirements which in conjunction with this new requirement will meet the needs for monitoring the implementation of required NO_X and SO_2 emissions reductions.

3. The EPA has determined that the requirement in the NO_X SIP Call for a special all-sources report by affected States for the year 2007, due December 31, 2008, is no longer needed to administer provisions in the NO_X SIP Call. Accordingly, EPA is eliminating this requirement in today's rule.

The final rule accomplishes these changes by making minimal changes to the existing provisions of 40 CFR part 51. Subpart A, which contains the CERR requirements, is not amended at all. 40 CFR 51.122, the section containing emission inventory reporting requirements for the NO_X SIP Call, is substantively amended only to delete the requirement for the 2007 inventory report.[122] A new section 40 CFR 51.125 is added to contain the two new emission inventory reporting requirements specifically related to the new CAIR requirements for emissions reductions, regarding ozone-season emissions of NO_X and every-year reporting of NO_X and SO_2 emissions from all sources controlled but not participating in the EPA trading programs. The new 40 CFR 51.125 refers to 40 CFR subpart A for the other specific data elements that must be reported.

VIII. Model NO_X and SO_2 Cap and Trade Programs

A. What Is the Overall Structure of the Model NO_X and SO_2 Cap and Trade Programs?

The EPA is finalizing model rules for the CAIR annual NO_X, CAIR ozone-season NO_X, and SO_2 trading programs that States can use to meet the emission reduction requirements in the CAIR. These rules are designed to be referenced by States in State rulemaking. State use of the model cap and trade rules helps to ensure consistency between the State programs, which is necessary for the market aspects of the regional trading program to function properly. It also allows the CAIR Program to build on the successful Acid Rain Program. Consistency in the CAIR requirements from State-to-State benefits the affected sources, as well as EPA, which administers the program on behalf of States.

This section focuses on the structure which maintains the existing NO_X SIP Call rules (in part 96, subparts A through J) while adding parallel rules for the CAIR annual NO_X (in subparts AA through II), CAIR SO_2 (in subparts AAA through III), and the CAIR ozone-season NO_X (in subparts AAAA through IIII) of the model rules. Commenters generally supported the proposed structure of the model rules, as well as the use of the cap and trade approach, which are maintained in the final rules. Later sections of today's rule discuss specific aspects of the model rules that have been modified or maintained in response to comment.

The EPA designed the model rules to parallel the NO_X SIP Call model trading rules (part 96) and to coordinate with the Acid Rain Program. Mirroring the structure of existing part 96 in the final CAIR NO_X and SO_2 model rules will ease the transition to the CAIR rules as many States and sources are already familiar with the layout of the NO_X SIP Call rule. In addition, because the EPA proposed new CAIR model trading rules—separate from the existing NO_X SIP Call model rule in part 96—States can continue to reference part 96 (subparts A through J) through 2008. The CAIR ozone-season NO_X cap and trade program that the EPA has included in today's final rule is intended for use by CAIR ozone-affected sources as well as those subject to the NO_X SIP Call in 2009 and beyond. Those States that wish to use an EPA-administered, ozone-season cap and trade program to achieve the reductions mandated by the CAIR or the NO_X SIP Call, must use the CAIR ozone-season NO_X model rule (subparts AAAA through IIII) in 2009 and beyond.

The model rules rely on the detailed unit-level emissions monitoring and reporting procedures of part 75 and consistent allowance management practices. (Note that full CAIR-related SIP requirements, *i.e.*, part 51, are discussed in section VII of today's preamble.) Additionally, section IX.B of today's preamble discusses the final revisions to parts 72 through 77 in order to, among other things, facilitate the interaction of the title IV Acid Rain Program's SO_2 cap and trade provisions and those of the CAIR SO_2 trading program.

Road Map of Model Cap and Trade Rules

The following is a brief "road map" to the final CAIR NO_X and SO_2 cap and trade programs. Please refer to the detailed discussions of the CAIR

[122] 40 CFR 51.122 is also amended: (1) to remove a reference to now-obsolete electronic data reporting processes (a "housekeeping" deletion that was specifically included in the proposed rule text with the SNPR), and (2) to make a minor technical correction to properly indicate which of the latitude versus longitude data elements corresponds to the x-coordinate and which to the y-coordinate (a correction that was implicitly proposed in the SNPR in that 51.122 was proposed to refer to 51 subpart A for all its data element descriptions).

NMED Exhibit 7f

programmatic elements throughout today's rule for further information on each aspect.

State Participation

• States have flexibility to achieve emissions reductions however they chose, including developing and implementing their own trading program.

• States may elect to participate in an EPA-managed cap and trade program. To participate, a State must adopt the model cap and trade rules finalized in this section of today's rule with flexibility to modify sections regarding NO_X allocations and whether to include individual unit opt-in provisions.

• States may participate in EPA-managed cap and trade programs for either the annual NO_X, the ozone-season NO_X, the SO_2, or any combination. The State can only choose to participate in the EPA-administered, CAIR cap and trade program(s) that is (are) relevant to their finding(s).

• The annual NO_X model rule is to be used by only those States that are affected by the CAIR $PM_{2.5}$ finding.

• The ozone-season NO_X model rule is designed to be used by those States that are affected by the CAIR ozone finding as well as take the place of the NO_X SIP Call requirements.[123] The CAIR ozone-season NO_X program will be the only ozone-season NO_X program that EPA will administer. Because EPA will no longer run a NO_X SIP Call trading program, States may include their NO_X SIP Call trading sources if they adopt the EPA-administered CAIR ozone-season NO_X program.

• The SO_2 model rule is designed to satisfy the ongoing statutory requirements of the title IV Acid Rain SO_2 cap and trade program—with sequential compliance with title IV and the CAIR—for sources in the CAIR region that are affected by both the Acid Rain Program and the CAIR.

Trading Sources

• States must achieve all of the mandated emission reductions from EGUs to participate in EPA-managed cap and trade programs. States may include other NO_X SIP Call trading sources in the ozone-season CAIR NO_X cap and trade program and still participate in EPA-managed cap and trade programs.

• States may participate in EPA-managed cap and trade programs whether or not they adopt the optional individual opt-in provisions of the model rule. However, if the State chooses to allow individual sources to opt-in, the opt-in requirements must reflect the requirements of the model rule.

Emission Allowances

• The CAIR annual NO_X cap and trade program will rely upon CAIR annual NO_X allowances allocated by the States. The NO_X SIP Call allowances and CAIR ozone-season NO_X allowances cannot be used for compliance with the annual CAIR reduction requirement. (Note that allowances from the Compliance Supplement Pool (CSP) will be CAIR annual NO_X allowances.)

• The CAIR ozone-season NO_X cap and trade program will rely upon CAIR ozone-season NO_X allowances allocated by the States. In addition, pre-2009 NO_X SIP Call allowances can be banked into the program and used by CAIR-affected sources for compliance with the CAIR ozone-season NO_X program. The NO_X SIP Call allowances of vintages 2009 and later can not be used for compliance with any EPA-administered cap and trade programs.

• The CAIR SO_2 cap and trade program will rely upon title IV SO_2 allowances but may also include additional CAIR SO_2 allowances, should a State that allows an individual unit opt-in mechanism provide CAIR SO_2 allowwances to an opt-in source. Pre-2010 title IV SO_2 allowances can be used for compliance with the CAIR.

• Sulfur dioxide reductions are achieved by requiring sources to retire more than one allowance for each ton of SO_2 emissions. The emission value of an SO_2 allowance is independent of the year in which it is used, but is based upon its vintage (*i.e.*, the year in which the allowance is issued). Sulfur dioxide allowances of vintage 2009 and earlier offset one ton of SO_2 emissions. Vintages 2010 through 2014 offset 0.5 tons of emissions. And, vintages 2015 and beyond offset 0.35 tons of emissions.

Allocation of Allowances to Sources

• For SO_2 allowances, sources have already received allowances through title IV.

• NO_X allowances (for both the annual and ozone-season programs) will be allocated based upon the State's chosen allocation methodology. The EPA's model NO_X rules have provided an example allocation, complete with regulatory text, that may be used by State's or replaced by text that implements a States alternative allocation methodology.

Compliance Supplement Pool (CSP)

• Each State will have a share of the CSP that is comprised of 200,000[124] CAIR annual NO_X allowances of vintage year 2009. The State may distribute the CSP allowances based upon the criteria, found in the SIP Approvability section of today's rule, for early reductions and need.

Emission Monitoring and Reporting by Sources

• Sources monitor and report their emissions using part 75. This includes individual sources that opt-in to the program.

• Source information management, emissions data reporting, and allowance trading is done through on-line systems similar to those currently used for the Acid Rain SO_2 and NO_X SIP Call Programs.

• Emission monitoring and reporting for both the CAIR annual and ozone-season NO_X cap and trade programs will use part 75.

Compliance and Penalties

• Compliance for the annual and ozone-season NO_X cap and trade programs, as well as the SO_2 program, will be determined separately.[125]

• For the NO_X and SO_2 cap and trade programs, any source found to have excess emissions must: (1) Surrender allowances sufficient to offset the excess emissions; and, (2) surrender allowances from the next control period equal to three times the excess emissions.

Comments Regarding the Use of a Cap and Trade Approach and the Proposed Structure

Commenters overwhelmingly supported the use of a cap and trade approach and the overall framework of the model rules to achieve the mandated emissions reductions. Some supported the use of cap and trade for achieving regional emissions reductions but noted the need to have additional measures that ensure that emission reductions take place in nonattainment areas. This is in line with the EPA's strategy of reducing transported SO_2 and NO_X through a regionwide cap and trade approach and encouraging States to take complementary measures to address their particular, persistent nonattainment issues. (Note that comments on specific mechanisms

[123] Rhode Island (RI) is the only State currently participating in the NO_X SIP Call cap and trade program that is not affected by today's ozone finding. As is explained in section IX, RI may join the CAIR ozone-season trading program as a means of satisfying its NO_X SIP Call requirements.

[124] The 200,000 total includes the share of the CSP that DE and NJ would receive if the EPA finalizes a parallel rule finding that they are significant contributors for $PM_{2.5}$.

[125] Compliance with the title IV Acid Rain Program will be determined separately from CAIR compliance.

within the cap and trade program are discussed in the topic-specific sections that follow.)

B. What Is the Process for States To Adopt the Model Cap and Trade Programs and How Will It Interact With Existing Programs?

1. Adopting the Model Cap and Trade Programs

States may choose to participate in the EPA-administered cap and trade programs, which are a fully approvable control strategy for achieving all of the emissions reductions required under today's rulemaking in a highly cost-effective manner. States may simply reference the model rules in their State rules and, thereby, comply with the requirements for statewide budget demonstrations detailed in section VII.B of today's preamble. Affected States for both $PM_{2.5}$ and ozone can adopt the annual NO_X and SO_2 cap and trade programs in part 96, subparts AA through II, part 96 subparts AAA through III, and AAAA through IIII. States with ozone-season only CAIR requirements (*i.e.*, Arkansas, Connecticut, Delaware, Massachusetts, and New Jersey) can adopt the ozone-season CAIR NO_X program (subparts AAAA through IIII). Part 96 subparts AA through II and AAA through III can be used by States that are affected for only $PM_{2.5}$ (*i.e.*, Georgia, Minnesota, and Texas). States that elect to achieve the required reductions by regulating other sources or using other approaches will follow alternate State requirements, also described in section VII.B of today's preamble.

As proposed, EPA is requiring States that wish to participate in the EPA-managed cap and trade program to use the model rule to ensure that all participating sources, regardless of which State in the CAIR region they are located, are subject to the same trading and allowance holding requirements. Further, requiring States to use the complete model rule provides for accurate, certain, and consistent quantification of emissions. Because emissions quantification is the basis for applying the emissions authorization provided by each allowance and emissions authorizations (in the form of allowances) are the valuable commodity traded in the market, the emissions quantification requirements of the model rule are necessary to maintain the integrity of the cap and trade approach of the program and therefore, to ensure that the environmental goals of the program are met.

For States Electing To Participate in the EPA-Administered Ozone-Season CAIR NO_X Cap and Trade Program

States that wish to achieve their CAIR ozone-season requirements through an EPA-administered ozone-season NO_X cap and trade program will adopt the CAIR model rule in subparts AAAA through IIII. (Note that the EPA-administered annual NO_X CAIR cap and trade program is independent of ozone-season CAIR NO_X model rule.) Because EPA will no longer administer the trading program for the NO_X SIP Call, States that wish to continue to meet their NO_X SIP Call obligations through an EPA-administered cap and trade program will also adopt the CAIR ozone-season model rule. NO_X SIP Call States will ''sun set'' their NO_X SIP Call rules for sources that will move into the CAIR NO_X ozone-season program. Part 96, sections A–J (*i.e.*, the NO_X SIP Call trading rule) will continue to be available for the NO_X SIP Call and will not be removed for the CAIR. The CAIR model rules specifically address how NO_X SIP Call allowances carry forward into the CAIR NO_X ozone-season program. (Section IX.A provides additional discussion of interactions between the CAIR and the NO_X SIP Call).

For States Electing To Participate in the EPA-Administered Annual NO_X Cap and Trade Program

States that are $PM_{2.5}$ affected and wish to participate in an EPA-administered annual NO_X cap and trade program will adopt the CAIR model rule in subparts AA through II. States may participate by either adopting the model rule provisions by reference or codifying the model rule in their State regulations.

For States Electing To Participate in the EPA-Administered SO_2 Cap and Trade Program

States may simply adopt new provisions, whether by incorporating by reference the CAIR SO_2 cap and Trade rule (part 96, subparts AAA through III) or codifying the provisions of the CAIR SO_2 cap and trade rules, in order to participate in the EPA-administered SO_2 cap and trade program. The CAIR SO_2 model rule works in conjunction with the Acid Rain Program provisions, which are implemented at the Federal level and will stay in place. Today's action also finalizes some revisions to the Acid Rain Program (*i.e.*, parts 72, 73, 74, 75, and 78). (Section IX.B of today's preamble provides additional discussion of interactions between the CAIR and the Acid Rain Program and changes to the Acid Rain Program).

Comments Regarding the Process for Adopting the Model Rules

Commenters supported EPA's proposed process and emphasized the importance of workable model rules, because States with limited resources are likely to incorporate them by reference or heavily rely on them as the basis for State rules.

2. Flexibility in Adopting Model Cap and Trade Rules

It is important to have consistency on a State-to-State basis with the basic requirements of the cap and trade approach when implementing a multi-State cap and trade program. Such consistency ensures the: Preservation of the integrity of the cap and trade approach so that the required emissions reductions are achieved; smooth and efficient operation of the trading market and infrastructure across the multi-State CAIR region so that compliance and administrative costs are minimized; and equitable treatment of owners and operators of regulated sources. However, EPA believes that some limited differences are possible without jeopardizing the environmental and other goals of the program. Therefore, the final rule allows States to modify the model rule language to best suit their unique circumstances in a few, specific areas.

First, States have the flexibility to include, as full trading partners, all trading sources affected by the NO_X SIP Call in the ozone-season CAIR NO_X cap and trade program. This is an outgrowth of the development of the CAIR ozone-season NO_X program, which will be the only ozone-season NO_X cap and trade program administered by EPA.

In addition, States may develop their own NO_X allocations methodologies, provided allocation information is submitted to EPA in the required timeframe. (Section VIII.D of today's preamble discusses unit-level allocations and the related comments in greater detail. This includes a discussion of the provisions establishing the advance notice States must provide for unit-by-unit allocations).

Lastly, States using the model cap and trade rules may elect to include provisions that allow individual units to ''opt-in'' to the cap and trade programs. States that wish to include this mechanism must adopt provisions discussed in section VIII.G of today's rulemaking. Adopting the individual unit opt-in provisions, which would allow non-EGUs that meet the opt-in requirements to enter into the EPA-managed cap and trade programs, does not preclude a State from participating

NMED Exhibit 7f

in the EPA-administered cap and trade programs.

C. What Sources Are Affected Under the Model Cap and Trade Rules?

In the January 2004 NPR, EPA proposed a method for developing budgets that assumed reductions only from EGUs. Electric Generating Units were defined as: Fossil fuel-fired, non-cogeneration EGUs serving a generator with a nameplate capacity of greater than 25 MWe; and fossil fuel-fired cogeneration EGUs meeting certain criteria (referred to as the ''1/3 potential electric output capacity criteria''). In the SNPR, we proposed model cap and trade rules that applied to the same categories of sources. We are finalizing the nameplate capacity cut-off that we proposed in the NPR for developing budgets and that we proposed in the SNPR for the applicability of the model trading rules. We are also finalizing the ''fossil fuel-fired'' definition and the 1/3 electric output capacity criteria that were proposed. The actual rule language in the SNPR describing the sources to which the model rules apply is being slightly revised to be clearer in response to some comments that the proposed language was not clear.

1. 25 MW Cut-Off

The EPA is retaining the 25 MW cut-off for EGUs for budget and model rule purposes. The EPA believes it is reasonable to assume no further control of air emissions from smaller EGUs. Available air emissions data indicate that the collective emissions from small EGUs are relatively small and that further regulating their emissions would be burdensome, to both the regulated community and regulators, given the relatively large number of such units. For example, NO_X and SO_2 emissions from EGUs of 25 MW or less in the CAIR region represent approximately one percent and two percent of total NO_X and SO_2 emissions from EGUs, respectively. There are over 4000 EGUs of 25 MW or less in the CAIR region. Consequently, EPA believes that administrative actions to control this large group with small emissions would be inordinate and thus does not believe these small units should be included. This approach of using a 25 MW cut-off for EGUs is consistent with existing SO_2 and NO_X cap and trade programs such as the NO_X SIP Call (where existing and new EGUs at or under this cut-off are, for similar reasons, not required to be included) and the Acid Rain Program (where this cut-off is applied to existing units and to new units combusting clean fuel). Also, EPA's New Source Performance Standards use an applicability threshold of approximately 25 MW under subpart Da.

One commenter suggested a plant-wide cut-off of 250 MW. This commenter suggested that including units between 25 and 250 MW would cause these units to shutdown but failed to provide any analysis to support its claim. Such a cut-off would be inconsistent with other existing SO_2 and NO_X cap and trade programs as noted above. The EPA estimates that approximately 1/3 of the SO_2 reductions, and 30 percent of the NO_X reductions, required under today's rule come from plants between 25 MW and 250 MW. Our modeling shows that some units below 250 MW will put on controls as part of our highly cost-effective set of control actions. The units also have the option to coal-switch, alter dispatch, and/or purchase allowances.

Another commenter suggested that, in lieu of the language proposed in the SNPR, EPA adopt a definition for EGU that, according to the commenter, is the Acid Rain Program's definition of affected utility. The commenter stated that the Acid Rain definition of EGU is ''all fossil fuel-fired units with a nameplate capacity greater than 25 MW supplying more than 1/3 of potential electrical output to the grid.'' However, the commenter misstated the Acid Rain definition and confused the Acid Rain applicability provisions concerning utility units in general with those provisions concerning cogeneration units in particular. The Acid Rain Program covers, with certain exceptions,[126] all existing fossil fuel-fired units greater than 25 MW that produce any electricity for sale; and new fossil fuel-fired units that produce any electricity for sale. The language referenced by the commenter concerning potential electrical output applies, in the Acid Rain Program, only to cogeneration units, not all fossil fuel-fired units. For non-cogeneration units, there is no exemption from Acid Rain Program requirements based on the unit selling a ''small'' amount of electricity for sale. The provisions in the NPR and the SNPR concerning cogeneration units are discussed below.

2. Definition of Fossil Fuel-Fired The

EPA is finalizing the proposed definition of fossil fuel-fired, *i.e.*, where any amount of fossil fuel is used at any time. This is the same definition that is used in the Acid Rain Program. One commenter suggested that the proposed definition is too broad and that EPA should use in the CAIR Program the same definition that is used in the NO_X SIP Call, *i.e.*, where a unit uses fossil fuel for at least 50 percent of its annual heat input during a specified period. The same commenter also proposed excluding large wood-fired boilers and black liquor recovery furnaces. The commenter's definition would result in units already subject to the Acid Rain Program in a given State being excluded from the CAIR Program and the model cap and trade rules applicable in that State. Such exclusion would make it more difficult to coordinate the Acid Rain Program and the CAIR Program. Consequently, EPA rejects the commenter's more restricted definition of fossil fuel-fired.

The EPA recognizes that new (*i.e.*, post-1990) units that are 25 MW or less and burn other than clean fuels are subject to the Acid Rain Program but not to the CAIR Program. However, there are very few such units, and EPA has decided to exclude any units that are 25 MW or less on other grounds discussed above.

3. Exemption for Cogeneration Units

As proposed, EPA is finalizing an exemption from the model cap and trade programs for cogeneration units, *i.e.*, units having equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through sequential use of energy and meeting certain operating and efficiency standards (discussed below). The EPA is adopting the proposed definition of cogeneration unit and the proposed criteria for determining which cogeneration units qualify for the exemption from the model cap and trade programs.

The CAIR trading program has different applicability provisions for non-cogeneration units and cogeneration units. If a unit initially qualifies as a cogeneration unit, and for the exemption from the trading program for certain cogeneration units, but subsequently loses its cogeneration-unit status (*e.g.*, due to changes in operation), such unit loses the cogeneration-unit exemption and becomes subject to the applicability criteria for non-cogeneration units, regardless of any future changes in the unit or its operations. If, under the non-cogeneration unit applicability criteria, the unit becomes subject to the trading program, the unit will remain subject to the program in the future. Conversely if a unit initially does not qualify as a cogeneration unit, such unit becomes subject to the applicability criteria for non-cogeneration units, regardless of

[126] For example, certain cogeneration units and new units 25 MW or less that burn only clean fuel are exempt from the Acid Rain Program.

NMED Exhibit 7f

any future changes in the unit. If, under such criteria, the unit is subject to the trading program, the unit will remain subject to the program in the future. This approach to applicability means that units (other than, in some cases, opt-in units) cannot go in and out of the trading program, which, if allowed, would make it difficult for EPA, States, and owners or operators to determine which units should be complying with trading program requirements, and during what years, and would likely result in more non-compliance problems.

a. Efficiency Standard for Cogeneration Units

The EPA proposed operating and efficiency standards (*i.e.*, the useful thermal energy output of the unit must be no less than a certain percent of the total energy output and, in some cases, useful power must be no less than a certain percent of total energy input) in the SNPR that a unit must meet in order to qualify as a cogeneration unit. If the unit qualifies as a cogeneration unit, then it may be eligible for exemption from the CAIR, depending upon whether it meets additional operating criteria, discussed below. As discussed in the NPR, EPA proposed the same operating and efficiency standards for all fossil fuel-fired units (regardless of whether they burn coal, oil, or gas). In addition, not applying the operating and efficiency standards to coal-fired units would be counter productive to EPA's efforts to reduce SO_2 and NO_X emissions under this proposed rule because of the relatively high SO_2 and NO_X emissions from coal-fired units. In particular, without application of the efficiency standards to coal-fired units, highly inefficient coal-fired units, which have particularly high emissions per MWhr generated, could be exempt from the CAIR Program. In addition, if coal-fired units were not subject to the operating standard, the potential would exist for a coal-fired unit to provide only a token amount of useful thermal energy and still qualify for a cogeneration unit exemption from the CAIR Program, despite having relatively high emissions.

One commenter suggested that EPA should not use the efficiency standards for solid fuel-fired cogeneration units, because it may require some coal-fired cogeneration units that were exempt from the Acid Rain Program to purchase CAIR allowances. However, the EPA analysis indicates that most existing solid fuel-fired cogeneration units affected by this rule will meet the proposed standard. See TSD entitled "Cogeneration Unit Efficiency Calculations" in the docket. To the extent any solid fuel-fired cogeneration units cannot meet the efficiency standard and become affected units under the CAIR, EPA believes that, considering their relatively high emissions of SO_2 and NO_X compared to oil and gas-fired units, it is important to require these sources to meet the efficiency standards or be subject to the emission limits under the CAIR Program.

Another commenter suggested that the efficiency standards should not apply to solid fuel-fired cogeneration units because solid fuel-fired unit efficiency is based on HHV (higher heating value) while gas, or oil-fired unit efficiency is based on LHV (lower heating value). The EPA analyzed a range[127] of solid fuel-fired cogeneration units and calculated their efficiencies to see if they would meet the minimum efficiency standard. All of the units selected satisfied the proposed efficiency standard. See TSD entitled "Cogeneration Unit Efficiency Calculations" in the docket. As a result, EPA believes that most solid fuel-fired cogeneration units will meet the proposed efficiency standard. The efficiency standard EPA is adopting is the Public Utility Regulatory Act (PURPA) of thermal efficiency of 42.5 percent. See TSD entitled, "Cogeneration Unit Efficiency Calculations" for further discussion, is based on LHV. If the efficiency of a solid-fuel-fired unit is expressed in terms of HHV, it can easily be converted to LHV for purposes of determining whether it meets the efficiency standard. Therefore, the reason given by the commenter (that solid fuel-fired unit efficiency is expressed in terms of HHV) is not grounds for not applying an efficiency standard to these units. One commenter supported applying the same efficiency standard to solid fuel-fired units as EPA proposed. The EPA is finalizing its proposed cogeneration unit definition, which applies the same operating and efficiency standards to all units regardless of the type of fossil fuel burned.

b. One-third Potential Electric Output Capacity

The EPA is finalizing the $^1/_3$ potential electric output capacity criteria in the NPR and SNPR. Under the proposals, the following cogeneration units are EGUs: Any cogeneration unit serving a generator with a nameplate capacity of greater than 25 MW and supplying more than $^1/_3$ potential electric output capacity and more than 219,000 MW-hrs annually to any utility power distribution system for sale. These criteria are similar to those used in the Acid Rain Program to determine whether a cogeneration unit is a utility unit and the NO_X SIP Call to determine whether a cogeneration unit is an EGU or a non-EGU. The primary difference between the proposed criteria and the $^1/_3$ potential electric criteria for the Acid Rain and NO_X SIP Call Programs is that these programs applied the criteria to the initial operation of the unit and then to 3-year rolling average periods while the proposed CAIR criteria are applied to each individual year starting with the commencement of operation. The EPA believes that using an individual year approach would streamline the application and administration of this exemption. No adverse comments were received on using an individual year approach as opposed to a 3-year rolling average. In addition, the criteria under the Acid Rain Program and the NO_X SIP Call are applied somewhat differently to units commencing construction on or before November 15, 1990 and units commencing construction after November 15, 1990. Several commenters suggested exempting all cogeneration units under the PURPA instead of using the proposed criteria and cite the high efficiency of cogeneration as a reason for a complete exemption. The EPA believes it is important to include in the CAIR Program all units, including cogeneration units, that are substantially in the business of selling electricity. The proposed $^1/_3$ potential electric output criteria described above are intended to do that.

Inclusion of all units substantially in the electricity sales business minimizes the potential for shifting utilization, and emissions, from regulated to unregulated units in that business and thereby freeing up allowances, with the result that total emissions from generation of electricity for sale exceed the CAIR emissions caps. The fact that units in the electricity sales business are generally interconnected through their access to the grid significantly increases the potential for utilization shifting.

One commenter suggested that the $^1/_3$ of potential electric output capacity criteria be applied on an annual basis. The EPA agrees that the criteria should be applied annually. The proposed and final model cap and trade rules adopt that approach.

c. Clarifying "For Sale"

Several commenters requested EPA confirm that, for purposes of applying the $^1/_3$ potential electric output criteria,

[127] The range included solid fuel-fired cogeneration units from 25 MW to 250 MW.

NMED Exhibit 7f

simultaneous purchases and sales of electricity are to be measured on a ''net'' basis, as is done in the Acid Rain Program. At least one commenter suggested that the net approach also be applied to purchase and sales that are not simultaneous. For purposes of applying the $^1/_3$ potential electric output criteria in the CAIR Program and the model cap and trade rules, EPA confirms that the only electricity that counts as a sale is electricity produced by a unit that actually flows to a utility power distribution system from the unit. Electricity that is produced by the unit and used on-site by the electricity-consuming component of the facility will not count, including cogenerated electricity that is simultaneously purchased by the utility and sold back to such facility under purchase and sale agreements under the PURPA. However, electric purchases and sales that are not simultaneous will not be netted; the $^1/_3$ potential electric output criteria will be applied on a gross basis, except for simultaneous purchase and sales. This is consistent with the approach taken in the Acid Rain Program.

d. Multiple Cogeneration Units

Some commenters suggested aggregating multiple cogeneration units that are connected to a utility distribution system through a single point when applying the $^1/_3$ potential electric output capacity criteria. These commenters suggested that it is not feasible to determine which unit is producing the electricity exported to the outside grid. The EPA proposed to determine whether a unit is affected by the CAIR on an individual-unit basis. This unit-based approach is consistent with both the Acid Rain Program and the NO_X SIP Call. The EPA considers this approach to be feasible based on experience from these existing programs, including for sources with multiple cogeneration units. The EPA is unaware of any instances of cogeneration unit owners being unable to determine how to apply the $^1/_3$ potential electric output capacity criteria where there are multiple cogeneration units at a source.

In a case where there are multiple cogeneration units with only one connection to a utility power distribution system, the electricity supplied to the utility distribution system can be apportioned among the units in order to apply the $^1/_3$ potential electric output capacity criteria. A reasonable basis for such apportionment must be developed based on the particular circumstances. The most accurate way of apportioning the electricity supplied to the utility power distribution system seems to be apportionment based on the amount of electricity produced by each unit during the relevant period of time.

Exemption for Independent Power Production (IPP) Facilities: Some commenters stated that certain IPP facilities are exempt from the Acid Rain Program and that they should also be exempt from the CAIR Program and model-cap and trade rules. Under the Acid Rain Program, an IPP facility that has, as of November 15, 1990, a qualifying power purchase commitment (including a sales price) to sell at least 15 percent of planned net output capacity and has installed net output capacity not exceeding 130 percent of planned net output capacity is exempt. However, if the power purchase commitment changes after November 15, 1990 in a way that allows the cost of compliance with the Acid Rain Program to be shifted to the purchaser, then the IPP facility loses the exemption. For example, expiration or termination of the power purchase commitment or modification so that the price is increased (*e.g.*, changed to a market price) results in loss of the exemption. The purpose of the exemption is to protect IPP facilities subject to contract prices that were set before passage of the CAA Amendments of 1990 (including the Acid Rain Program in title IV) and that did not allow passthrough of the costs of Acid Rain Program compliance. However, EPA maintains that this exemption was aimed at easing the transition of such facilities into the Acid Rain Program and that there is no basis for maintaining this exemption for every subsequent cap and trade program. In addition, this exemption was not used in the NO_X SIP Call.

D. How Are Emission Allowances Allocated to Sources?

It is important to have consistency on a State-by-State basis with the basic requirements of the cap and trade approach when implementing a multi-State cap and trade program. This will ensure that: The integrity of the cap and trade approach is preserved so that the required emissions reductions are achieved; the compliance and administrative costs are minimized; and source owners and operators are equitably treated. However, EPA believes that some limited differences, such as allowance allocation methodologies for NO_X allowances, are possible without jeopardizing the environmental and other goals of the program.

1. Allocation of NO_X and SO_2 Allowances

Each State participating in EPA-administered cap and trade programs must develop a method for allocating (*i.e.*, distributing) an amount of allowances authorizing the emissions tonnage of the State's CAIR EGU budget. For NO_X allowances, each State has the flexibility to allocate its allowances however they choose, so long as certain timing requirements are met.

For SO_2, as noted in the January 2004 proposal, States will have no discretion in their allocation approach since the CAIR SO_2 cap and trade program uses title IV SO_2 allowances, which have been already allocated in perpetuity to individual units by title IV of the CAA.

a. Required Aspects of a State NO_X Allocation Approach

While it is EPA's intent to provide States with as much flexibility as possible in developing allocation approaches, there are some aspects of State allocations that must be consistent for all States. All State allocation systems are required to include specific provisions that establish when States notify EPA and sources of the unit-by-unit allocations. These provisions establish a deadline for each State to submit to EPA its unit-by-unit allocations for processing into the electronic allowance tracking system. Since the Administrator will then expeditiously record the submitted allowance allocations, sources will thereby be notified of, and have access to, allocations with a minimum lead time (about 3 years) before the allowances can be used to meet the NO_X emission limit.

Today's action finalizes the proposal to require States to submit unit-by-unit allocations of allowances for a given year no less than 3 years prior to January 1 of the allowance vintage year, which approach was supported by commenters.[128] Requiring States to submit allocations and thereby provide a minimum lead time before the allowances can be used to meet the NO_X emission limit ensures that an affected source—regardless of the State in the CAIR region in which the unit is located—will have sufficient time to plan for compliance and implement their compliance planning. Allocating allowances less than 3 years in advance of the compliance year may reduce a CAIR unit's ability to plan for and implement compliance and,

[128] If the deadline for States to submit SIPs is September of 2006, then this would result in notification period of less than 3 years for the first year of CAIR.

NMED Exhibit 7f

consequently, increase compliance costs. For example, a shorter lead time would reduce the period for buying or selling allowances and could prevent sources from participating in allowance futures markets, a mechanism for hedging risk and lowering costs.

Further, requiring a uniform, minimum lead-time for submission of allocations allows EPA to perform its allocation-recordation activities in a coordinated and efficient manner in order to complete expeditiously the recordation for the entire CAIR region and thereby promote a fair and competitive allowance market across the region.

These minimum requirements apply to the NO_X allocation approach and are not relevant for the SO_2 cap and trade program, which relies on title IV allowances.

b. Flexibility and Options for a State NO_X Allowance Allocations Approach

Allowance allocation decisions in a cap-and-trade program raise essentially distributional issues, as economic forces are expected to result in economically efficient and environmentally similar outcomes regardless of the manner in which allowances are initially distributed. Consequently, for CAIR NO_X allowances, States are given latitude in developing their allocation approach. NO_X allocation methodology elements for which States will have flexibility include:

A. The cost of the allowance distribution (*e.g.*, free distribution or auction);

B. The frequency of allocations (*e.g.*, permanent or periodically updated);

C. The basis for distributing the allowances (*e.g.*, heat-input or power output); and,

D. The use of allowance set-asides and their size, if used (*e.g.*, new unit set-asides or set-asides for energy efficiency, for development of Integrated Gasification Combined Cycle (IGCC) generation, for renewables, or for small units).

Some commenters have argued against giving States flexibility in determining NO_X allocations, citing concerns about complexity of operating in different markets and about the robustness of the trading system. The EPA maintains that offering such flexibility, as it did in the NO_X SIP Call, does not compromise the effectiveness of the trading program.

A number of commenters have argued against allowing (or requiring) the use of allowance auctions, while others did not believe that EPA should recommend auctions. For today's final action, while there are some clear potential benefits to using auctions for allocating allowances (as noted in the SNPR), EPA believes that the decision regarding utilizing auctions should ultimately be made by the States. Therefore, EPA is not requiring, restricting, or barring State use of auctions for allocating allowances.

A number of commenters supported allowing the use of allowance set-asides for various purposes. In today's final action, EPA is leaving the decision on using set-asides up to the States, so that States may craft their allocation approach to meet their State-specific policy goals.

i. Example Allowance Allocation Methodology

In the SNPR, EPA included an example (offered for informational guidance) of an allocation methodology that includes allowances for new generation and is administratively straightforward. In today's preamble, EPA is including in today's preamble, this ''modified output'' example allocations approach, as was outlined in the SNPR.

The EPA maintains that the choice of allocation methodology does not impact the achievement of the specific environmental goals of the CAIR Program. This methodology is offered simply as an example, and individual States retain full latitude to make their own choices regarding what type of allocation method to adopt for NO_X allowances and are not bound in any way to adopt EPA's example.

This example method involves input-based allocations for existing fossil units, with updating to take into account new generation on a modified-output basis. It also utilizes a new source set-aside for new units that have not yet established baseline data to be used for updating. Providing allowances for new sources addresses a number of commenter concerns about the negative effect of new units not having access to allowances.

Under the example method, allocations are made from the State's EGU NO_X budget for the first five control periods (2009 through 2013) of the model cap and trade program for existing sources on the basis of historic baseline heat input. Commenters expressed some concern regarding the proposed January 1, 1998 cut-off on-line date for considering units as existing units. The cut-off on-line date was selected so that any unit meeting the cut-off date would have at least 5 years of operating data, *i.e.*, data for 1998 through 2002 (which was the last year for which annual data was available). The EPA is still concerned with ensuring that particular units are not disadvantaged in their allocations by having insufficient operating data on which to base the allocations. The EPA believes that a 5 year window, starting from commencement of operation, gives units adequate time to collect sufficient data to provide a fair assessment of their operations. Annual operating data is now available for 2003. The EPA is finalizing January 1, 2001 as the cut-off on-line date for considering units as existing units since units meeting the cut-off date will have at least 5 years of operating data (*i.e.*, data for 2001 through 2005).

The allowances for 2014 and later will be allocated from the State's EGU NO_X budget annually, 6 years in advance, taking into account output data from new units with established baselines (modified by the heat input conversion factor to yield heat input numbers). As new units enter into service and establish a baseline, they are allocated allowances in proportion to their share of the total calculated heat input (which is existing unit heat input plus new units' modified output). Allowances allocated to existing units slowly decline as their share of total calculated heat input decreases with the entry of new units.

After 5 years of operation, a new unit will have an adequate operating baseline of output data to be incorporated into the calculations for allocations to all affected units. The average of the highest 3 years from these 5 years will be multiplied by the heat-input conversion factor to calculate the heat input value that will be used to determine the new unit's allocation from the pool of allowances for all sources.

Under the EPA example method, existing units as a group will not update their heat input. This will eliminate the potential for a generation subsidy (and efficiency loss) as well as any potential incentive for less efficient existing units to generate more. This methodology will also be easier to implement since it will not require the updating of existing units' baseline data. Retired units will continue to receive allowances indefinitely, thereby creating an incentive to retire less efficient units instead of continuing to operate them in order to maintain the allowances allocations.

Moreover, new units as a group will only update their heat input numbers once—for the initial 5-year baseline period after they start operating. This will eliminate any potential generation subsidy and be easier to implement, since it will not require the collection

NMED Exhibit 7f

and processing of data needed for regular updating.

The EPA believes that allocating to existing units based on a baseline of historic heat input data (rather than output data) is desirable, because accurate protocols currently exist for monitoring this data and reporting it to EPA, and several years of certified data are available for most of the affected sources. The EPA expects that any problems with standardizing and collecting output data, to the extent that they exist, can be resolved in time for their use for new unit calculations. Given that units keep track of electricity output for commercial purposes, this is not likely to be a significant problem.

A number of commenters expressed support for EPA's proposal in the SNPR that the heat input data for existing units be adjusted by multiplying it by different factors based on fuel-type. Contrary to some commenters' claims, determining allocations with fuel factors would not create disincentives for efficiency. With the use of a single baseline for existing units, neither adjusted input, nor input, nor output based allocations would provide additional incentives for energy efficiency. All sources have incentives to reduce emissions (improving efficiency is a way of doing this) as a result of the cap and trade program, not because of the choice of an allocation based on a single historic baseline.

The EPA acknowledges that since allowances have value, different allocations of allowances clearly do impact the distribution of wealth among different generators. However, in general, the economics of power generation dictate that generators selling power will seek to operate (and burn fuel) to meet energy demand in a least-cost manner. The cost of the power generated (reflecting the bid price per megawatt hour) will include the cost of allowances to cover emissions, whether the generator uses allowances that it already owns, or whether it needs to purchase additional allowances. With a liquid market for allowances, allocations for existing sources (whose baseline does not change) are a sunk benefit or sunk cost, not impacting the existing generator's behavior on the margin. Thus, the use of fuel factors in our allocating method would not be expected to result in changes in generators' choices for fuel efficiency.

In its example allocation approach, EPA is including adjustments of heat input by fuel type based on average historic NO_X emissions rates by three fuel types (coal, natural gas, and oil) for the years 1999–2002. As noted in the SNPR, such calculations would lead to adjustment factors of 1.0 for coal, 0.4 for gas and 0.6 for oil. The factors would reflect the inherently different emissions rates of different fossil-fired units (and consequently also reflect the different burdens to control emissions.

However, allocating to new (not existing) sources on the basis of input (and particularly fuel-adjusted heat input) would serve to subsidize less-efficient new generation. For a given amount of generation, more efficient units will have the lower fuel input or heat input. Allocating to new units based on heat input could encourage the building of less efficient units since they would get more allowances than an equivalent efficient, lower heat-input unit. The modified output approach, as described below, will encourage new, clean generation, and will not reward less efficient new coal units or less efficient new gas units.

Under the example method, allowances will be allocated to new units of each fuel-type with an appropriate baseline on a ''modified output'' basis. The new unit's modified output will be calculated by multiplying its gross output by a heat rate conversion factor of 7,900 btu/kWh for coal units and 6,675 btu/kWh for oil and gas units. The 7,900 btu/kWh value for the conversion factor for new coal units is an average of heat-rates for new pulverized coal plants and new IGCC coal plants (based upon assumptions in EIA's Annual Energy Outlook (AEO) 2004 [129]). The 6,675 btu/kWh value for the conversion factor for new gas units is an average of heat-rates for new combined cycle gas units (also based upon assumptions in EIA's AEO 2004). A single conversion rate for each fuel-type will create consistent and level incentives for efficient generation, rather than favoring new units with higher heat-rates.

For new cogeneration units, their share of the allowances will be calculated by converting the available thermal output (btu) of useable steam from a boiler or useable heat from a heat exchanger to an equivalent heat input by dividing the total thermal output (btu) by a general boiler/heat exchanger efficiency of 80 percent.

New combustion turbine cogeneration units will calculate their share of allowances by first converting the available thermal output of useable steam from a heat recovery steam generator (HRSG) or useable heat from a heat exchanger to an equivalent heat input by dividing the total thermal output (btu) by the general boiler/heat exchanger efficiency of 80 percent. To this they will add the electrical generation from the combustion turbine, converted to an equivalent heat input by multiplying by the conversion factor of 3,413 btu/kWh. This sum will yield the total equivalent heat input for the cogeneration unit.

Steam and heat output, like electrical output, is a useable form of energy that can be utilized to power other processes. Because it would be nearly impossible to adequately define the efficiency in converting steam energy into the final product for all of the various processes, this approach focuses on the efficiency of a cogeneration unit in capturing energy in the form of steam or heat from the fuel input.

Commenters expressed concern about a single conversion factor, arguing for different factors for different fuels and technologies. The EPA recognizes these concerns and agrees that different new fossil-generation units have inherently different heat rates, largely dictated by the technology needed to burn different fuels. A single conversion rate for all units would provide new gas-fired combined cycle units with relatively more allowances, relative to their emissions, than it would for new coal-fired units.

The EPA maintains that providing each new source an equal amount of allowances per MWh of output, given the fuel it is burning, is an equitable approach. Since electricity output is the ultimate product being produced by EGUs, a single conversion factor for each fuel, based on output, ensures that all new sources burning a particular fuel will be treated equally.

Some commenters support allocating allowances to all new generation, not just fossil fuel-fired CAIR units. The EPA notes that including new non-CAIR and non-fossil units in the allowance distribution would raise issues, about which EPA lacks sufficient information for resolution at this time for EPA's example method. It would be necessary to clearly define what types of generating facilities that could participate and what would constitute ''new'' non-fossil generation.[130] Commenters did not provide any analysis of the impact of possible definitions on generation mix, or electricity markets. Further, in order to include all generation, there would be a need to establish application and data

[129] Energy Information Administration, ''Annual Energy Outlook 2004, With Projections to 2025'', January 2004. Assumptions for the NEMS model. *http://www.eia.doe.gov/oiaf/archive/aeo04/assumption/tbl38.html.*

[130] Some commenters stated that, if allocations were provided for non-emitting new generation, they also should be provided to all such generation, including nuclear units.

NMED Exhibit 7f

collections procedures and determine appropriate size cut-offs and boundaries of this generation—since in many such instances there is no clear analog to discrete fossil ''units.'' [131] There also are associated issues about developing appropriate measurement and data reporting requirements for such sources. Commenters supporting this approach did not address any of these matters in any detail. However, EPA encourages States that are interested in including such units in their updating allocations to consider potential solutions and include them in their SIPs. Under the example method, new units that have entered service, but have not yet started receiving allowances through the update, will receive allowances each year from a new source set-aside. The new source allowances from the set-aside will be distributed based on their actual emissions from the previous year. Such an allocation approach will generally provide new units sufficient allowances to cover their emissions during the interim period before the units are allocated allowances on the same basis as existing units.

Today's example method includes a new source set-aside equal to 5 percent of the State's emission budget for the years 2009–2013 and 3 percent of the State's emission budget for the subsequent years. In the SNPR, EPA proposed a level 2 percent set-aside for all years.

Commenters noted their concern that the amount of the set-aside in the early years of the program should be higher to reflect the fact that the set-aside will initially need to accommodate all new units entering into service from 1998 through 2010.[132] In order to estimate the need for allocations for new units, EPA looked at the NO_X emissions from units that went online starting in 1999 as projected by the Integrated Planning Model (IPM) runs modeling CAIR for the years 2010 and 2015. These IPM emissions projections indicated over 57,000 tons of NO_X emissions in 2010 and about 74,000 tons of NO_X emission by 2015 from new sources need to be covered under set-asides throughout the CAIR region. The 2010 number represents almost 4 percent of the Phase I NO_X regional cap, while the 2015 number represents about 6 percent of the Phase I regional cap. Consequently, today's example method includes a 5 percent set-aside for the initial period (2009–2013). It should be noted that by 2014, the set-aside would need to cover new sources from the entire period 2004–2013.

The choice of a 3 percent new source set-aside, starting in 2014, reflects concerns that adequate allowances be provided for the 10 years of new units to be covered by the set-aside in 2014 and subsequent years. (The set-aside in 2014, for example, would need to accommodate all units that went on-line between 2004 and 2013).

Individual States using a version of the example method may want to adjust this initial 5 year set-aside amount to a number higher or lower than 5 percent to the extent that they expect to have more or less new generation going on-line during the 2001–2013 period. They may also want to adjust the subsequent set-aside amount to a number higher or lower than 3 percent to the extent that they expect more or less new generation going on-line after 2004. States may also want to set this percentage a little higher than the expected need, since, in the event that the amount of the set-aside exceeds the need for new unit allowances, the State may want to provide that any unused set-aside allowances will be redistributed to existing units in proportion to their existing allocations.

For the example method, EPA is finalizing the approach that new units will begin receiving allowances from the set-aside for the control period immediately following the control period in which the new unit commences commercial operation, based on the unit's emissions for the preceding control period. Thus, a source will be required to hold allowances during its start-up year, but will not receive an allocation for that year.

States will allocate allowances from the set-aside to all new units in any given year as a group. If there are more allowances requested than in the set-aside, allowances will be distributed on a pro-rata basis. Allowance allocations for a given new unit in following years will continue to be based on the prior year's emissions until the new unit establishes a baseline, is treated as an existing unit, and is allocated allowances through the State's updating process. This will enable new units to have a good sense of the amount of allowances they will likely receive—in proportion to their emissions for the previous year. This methodology will not provide allowances to a unit in its first year of operation; however it is a methodology that is straightforward, reasonable to implement, and predictable.

In the SNPR, the example method from the NO_X SIP Call model rule was proposed as an alternate approach.[133] However, the EPA has found this approach to be complicated for both the States and the EPA to implement. Additionally, the NO_X SIP Call approach would introduce a higher level of uncertainty for sources in the allocation process than necessary.

While the EPA is offering an example allocation method with accompanying regulatory language, the EPA reiterates that it is giving States' flexibility in choosing their NO_X allocations method so they may tailor it to their unique circumstances and interests. Several commenters, for instance, have noted their desire for full output-based allocations (in contrast to the hybrid approach in the example above). In the past, EPA had sponsored a work group to assist States wishing to adopt output-based NO_X allocations for the NO_X SIP Call and believes it is a viable approach worth considering. Documents from meetings of this group and the resulting guidance report (found at *http://www.epa.gov/airmarkets/fednox/workgrp.html)* together with additional resources such as the EPA-sponsored report ''Output-Based Regulations: A Handbook for Air Regulators'' (found at *http://www.epa.gov/cleanenergy/pdf/output_rpt.pdf*) can help States, should they choose to adopt any output-based elements in their allocation plans.

As an another alternative example, States could decide to include elements of auctions into their allowance allocation programs.[134] An example of an approach where CAIR NO_X allowances could be distributed to sources through a combination of an auction and a free allocation is provided below.

During the first year of the trading program, 94 percent of the NO_X allowances could, for example, be allocated to affected units with an auction held for the remaining 1 percent of the NO_X allowances [135]. Each subsequent year, an additional 1 percent of the allowances (for the first 20 years of the program), and then an additional 2.5 percent thereafter, could be auctioned until eventually all the allowances are auctioned. With such a system, for the first 20 years of the

[131] For instance, would the addition of a single new wind turbine at a wind-farm constitute a ''new unit''?

[132] As noted earlier in this section, EPA is now considering new units to be those that went online after January 1, 2001 rather than 1998.

[133] With the alternate approach from the NO_X SIP Call. States could distribute a new source set-aside for a control period based on full utilization rates, at the end of the year the actual allowance allocation would be adjusted to account for actual unit utilization/output, and excess allowances would be returned and redistributed, first taking into account new unit requests that were not able to be addressed.

[134] Auctions could provide States with a non-distortionary source of revenue.

[135] 5 percent of the allowances would go to a new source set-aside.

NMED Exhibit 7f

trading programs, the majority of allowances would be distributed for free via the allocation. Allowances allocated for these earlier years are generally more valuable than allowances allocated for later years because of the time value of money. Thus, most emitting units would receive relatively more allowances in the early years of the program, when they are facing the expenses of taking actions to control their emissions. Even though the proportion of allowances allocated to existing sources declines in the later years of the program, these sources receive for free a very significant share of the total value of allowances (because the discounted present value of allowances allocated in the early years of the program is greater than the discounted present value of the allowances auctioned later).

Auctions could be designed by the State to promote an efficient distribution of allowances and a competitive market. Allowances would be offered for sale before or during the year for which such allowances may be used to meet the requirement to hold allowances. States would decide on the frequency and timing of auctions. Each auction would be open to any person, who would submit bids according to auction procedures, a bidding schedule, a bidding means, and by fulfilling requirements for financial guarantees as specified by the State. Winning bids, and required payments, for allowances would be determined in accordance with the State program and ownership of allowances would be recorded in the EPA Allowance Tracking System after the required payment is received.

The auction could be a multiple-round auction. Interested bidders would submit before the auction, one or more initial bids to purchase a specified quantity of NO_X allowances at a reserve price specified by the State, specifying the appropriate account in the Allowance Tracking System in which such allowances would be recorded. Each bid would be guaranteed by a certified check, a funds transfer, or, in a form acceptable to the State, a letter of credit for such quantity multiplied by the reserve price. For each round of the auction, the State would announce current round reserve prices for NO_X and determine whether the sum of the acceptable bids exceeds the quantity of such allowances, available for auction. If the sum of the acceptable bids for NO_X allowances exceeds the quantity of such allowances the State would increase the reserve price for the next round. After the auction, the State would publish the names of winning and losing bidders, their quantities awarded, and the final prices. The State would return payment to unsuccessful bidders and add any unsold allowances to the next relevant auction.

In summary, today's action provides, for States participating in the EPA-administered CAIR NO_X cap and trade program, the flexibility to determine their own methods for allocating NO_X allowances to their sources. Specifically, such States will have flexibility concerning the cost of the allowance distribution, the frequency of allocations, the basis for distributing the allowances, and the use and size of allowance set-asides.

E. What Mechanisms Affect the Trading of Emission Allowances?

1. Banking

a. The CAIR NPR and SNPR Proposal for the Model Rules and Input From Commenters

Banking is the retention of unused allowances from 1 calendar year for use in a later calendar year. Banking allows sources to make reductions beyond required levels and ''bank'' the unused allowances for use later. Generally speaking, banking has several advantages: It can encourage earlier or greater reductions than are required from sources, stimulate the market and encourage efficiency, and provide flexibility in achieving emissions reductions goals. When sources reduce their SO_2 and NO_X emissions in the early phases, the cap and trade program creates an emissions ''glide path'' that provides earlier environmental benefits and lower cost of compliance. This ''glide path'' does allow emissions to exceed the cap and trade program budget—especially in the initial years after the adoption of a more stringent cap. The use of banked allowances from the Acid Rain and NO_X SIP Call Programs in the CAIR NO_X and SO_2 cap and trade programs is discussed below in section VIII.F of this preamble.

The January 30, 2004 CAIR NPR and June 10, 2004 CAIR SNPR proposed that the CAIR NO_X and SO_2 cap and trade programs allow banking and the use of banked allowances without restrictions. Allowing unrestricted banking and the use of banked allowances is consistent with the existing Acid Rain SO_2 cap and trade program. The NO_X SIP Call cap and trade program, however, has some restrictions on the use of banked allowances, a procedure called ''flow control,'' described in detail in the June 10, 2004 CAIR SNPR.

Comments Regarding Unrestricted Banking After the Start of the CAIR NO_X and SO_2 Cap and Trade Programs

Many commenters supported the EPA's proposal to allow unrestricted banking and the use of banked allowances for both SO_2 and NO_X, agreeing that flow control is a complex and confusing procedure with undemonstrated environmental benefit. Further, they agreed that banking with no restrictions on use will encourage early emissions reductions, stimulate the trading market, encourage efficient pollution control, and provide flexibility to affected sources in meeting environmental objectives.

Other commenters objected to the EPA's proposal to allow unrestricted use of banked allowances. All of these commenters supported some use of flow control in the CAIR cap and trade programs, most supporting its use for both SO_2 and NO_X.

Some commenters disagreed with the EPA's assessment that the use of flow control in the Ozone Transport Commission (OTC) cap and trade program was complicated to understand and implement and caused market complexity. One commenter further elaborated that flow control was accepted by industry. Another commenter claimed that the EPA has not analyzed the impact of the flow control mechanism.

Some commenters supportive of flow control stated that flow control was ''successful'' in the OTC and NO_X SIP Call trading programs and ''worked well'' and ''achieved the desired effect,'' without supporting those statements.

b. The Final CAIR Model Rules and Banking

The EPA acknowledges that the OTC NO_X cap and trade program has functioned for several years despite the complexity introduced by the flow control procedures. Industry and other allowance traders have adapted to these complex procedures, yet there are ongoing questions from the regulated community about how the procedures actually work. As an example, one commenter, while disagreeing with the EPA's assertion that flow control is overly complex, goes on to describe incorrectly the implementation of flow control. The NO_X SIP Call cap and trade program includes similar procedures but flow control was not triggered in the first 2 years of the program (2003 and 2004), so there is no experience to be drawn from that program.

The EPA maintains that the benefits of utilizing these complex procedures is questionable. The EPA has analyzed the use of the flow control procedures in a paper released in March 2004, ''Progressive Flow Control in the OTC NO_X Budget Program: Issues to Consider at the Close of the 1999 to 2002 Period.'' The lessons learned from this analysis were as follows:

(1) Flow control can create market pricing complexity and uncertainty. The need for implementation of flow control for a particular control period is not known more than a few months in advance, and the value of banked allowances varies from year to year, depending on whether flow control has been triggered for the particular year. Therefore, when deciding how much to control, a source has some increased uncertainty about the value of any excess allowances it generates.

(2) Flow control can have a bigger impact on small entities than on large entities. Large firms with multiple allowance accounts can shift banked allowances among those accounts to minimize the number of banked allowances surrendered at a discounted rate.

(3) Flow control does not directly affect short-term emissions, so it may not serve the environmental goals for which it was created.

Incorporating these lessons learned, the EPA is finalizing the CAIR NO_X and SO_2 cap and trade programs with no flow control mechanism.

2. Interpollutant Trading Mechanisms

a. The CAIR NPR Proposal for the Model Rules and Input From Commenters

Mechanisms for interpollutant trading allow reduced emissions of one pollutant to be exchanged for increased emissions of another pollutant where both pollutants cause the same environmental problem (*e.g.*, are precursors of a third pollutant). Interpollutant trading mechanisms are typically based upon each precursor's contribution to a particular environmental problem and are often controversial and scientifically difficult to design because of the complexities of environmental chemistry. Determination of conversion factors (*i.e.*, transfer ratios that relate the impact of one pollutant to the impact of another pollutant) can be dependent upon location, the presence of other pollutants that are necessary for chemical reactions, the time of emissions, and other considerations.

The January 30, 2004 CAIR NPR did not propose a specific interpollutant trading mechanism but rather took comment on interpollutant trading in general as well as the following specific issues:

(1) What would be the exchange rate (*i.e.*, the transfer ratio) for the two pollutants,

(2) How can the transfer ratio best achieve the goals of $PM_{2.5}$ and ozone reductions in downwind States and,

(3) How would the interpollutant trading accommodate the different geographic regions of the $PM_{2.5}$ and ozone programs?

Comments Regarding the Potential Interpollutant Trading

The EPA received several comments on interpollutant trading with the most commenters generally opposed to including provisions to allow for the interchangability of SO_2 and NO_X allowances.

Several commenters pointed out that the CAIR ozone attainment benefits result from the NO_X emissions reductions, and contend that the EPA has not shown that SO_2 emissions impact ozone. Therefore, the commmenters conclude that it would be inappropriate for SO_2 allowances to be traded and used for compliance with the NO_X cap. Some commenters supported the consideration or use of interpollutant trading if it was one-directional, *i.e.*, NO_X allowances could be used for compliance with the SO_2 allowance holding requirements, but not vice versa. This could result in fewer NO_X emissions and more SO_2 emissions.

Some commenters supported the consideration or use of interpollutant trading and emphasized the scientific difficulty in developing accurate transfer ratios. Of these commenters, some added that interpollutant trading would be appropriate if the EPA conducted a thorough analysis of the potential impacts that interpollutant trading would have on: nonattainment areas' ability to come into attainment; the allowance markets and prices; and the integrity of the NO_X caps in light of the potentially large SO_2 allowance bank that might be carried forward into the CAIR trading programs.

A few commenters noted that the EPA is directed by the CAA to study interpollutant trading and has approved SIPs that allow the trading of ozone precursors under specific circumstances.

b. Interpollutant Trading and the Final CAIR Model Rules

Interpollutant trading can provide some additional compliance flexibility, and potentially lower compliance costs, if appropriately applied to multiple pollutants that have reasonably well known impacts on the same environmental problem. The EPA acknowledges that it has the authority to create interpollutant trading programs and has done so, in other regulatory contexts, in the past. However, for several reasons, the EPA determined that direct interpollutant trading is not appropriate in the CAIR.

The final CAIR includes separate annual SO_2 and annual NO_X model rules to address $PM_{2.5}$ precursor emissions, and an ozone-season NO_X model rule to address summertime ozone precursor emissions. The EPA believes it is not appropriate for the CAIR model rules to allow annual SO_2 or NO_X allowances to be used for compliance with ozone-season NO_X allowance holding requirements because this has the potential to adversely impact the ozone-season emissions reductions and ozone air quality improvements from CAIR. This is significant because the EPA, as required by the CAA, has promulgated a national air quality standard for 8-hour ozone based on a determination that the standard is necessary to protect public health. Section 110(a)2(D) requires States to prohibit emissions in amounts that will significantly contribute to nonattainment in, or interfere with maintenance by, any other State with respect to any air quality standard, including ozone. In this rule, EPA has designed the annual (SO_2 and NO_X) and ozone-season (NO_X) emission caps to achieve the emissions reductions necessary to address each State's significant contribution to downwind $PM_{2.5}$ and ozone nonattainment, respectively, and to prevent interference with maintenance. If sources were permitted to use annual SO_2 or annual NO_X allowances for compliance with ozone-season NO_X allowance holding requirements (*i.e.*, the ozone-season NO_X cap), then there would be no assurance that upwind States' ozone-season NO_X reduction obligations would be met, and CAIR's projected ozone improvements in downwind nonattainment areas could be significantly reduced. As a result, should interpollutant trading be permitted between the annual and ozone-season programs, the EPA could not demonstrate that the use of a CAIR ozone-season cap and trade program would result in the emissions reductions necessary to satisfy upwind States' obligations under section 110(a)2(D)to reduce NO_X for ozone purposes.

The EPA believes it is also inappropriate to use annual NO_X allowances for compliance with the annual SO_2 allowance holding requirements, and vice versa. The EPA agrees with commenters that emphasize

NMED Exhibit 7f

that the chemical interactions for $PM_{2.5}$ precursors are scientifically complex and must be accurately reflected in any transfer ratio in order to maintain the integrity of the market. For example, EPA analysis has shown (see January 30, 2004 NPR) that $PM_{2.5}$ precursors, such as NO_X and SO_2, may have non-linear interactions in the formation of $PM_{2.5}$. Any uniform, interpollutant transfer ratio would have to be an average and would introduce significant variability concerning the impact of interpollutant trading on emissions and significant uncertainty concerning the achievement of the CAIR Program's emission reduction goals. The EPA did not receive a response to the request in the January 30, 2004 NPR for information on an appropriate value for a potential transfer ratio. While the EPA did receive one comment that recommended the use of a trading ratio of two NO_X allowances for one SO_2 allowance, no comments presented supporting analysis that could be used to develop transfer ratios.

While many commenters supportive of allowing interpollutant trading in the CAIR claimed that it would provide additional compliance flexibility to sources, the EPA contends that use of the newly created CAIR trading markets is sufficiently flexible. Sources may develop integrated, multi-pollutant control strategies and use the separate allowance markets to mitigate differences in control costs (within the boundaries of emissions caps). In other words, a source can choose the level to which they can cost effectively control one pollutant and, if necessary, buy or sell emission allowances of the other pollutant to compensate for any expensive or inexpensive control cost. When markets are used to provide for trading of multiple pollutants, sources benefit from the additional compliance flexibility while the caps assure the achievement of the overarching environmental goals.

In the June 10, 2004 SNPR, the EPA solicited comment on how an interpollutant trading mechanism might accommodate the slightly different geographic regions found to be significant contributors for $PM_{2.5}$ and ozone under the CAIR. No commenters provided supporting analysis or input on this issue.

In summary, the EPA received comments that generally opposed including a specific interpollutant trading mechanism. No commenters provided analysis to demonstrate the benefit of including a specific interpollutant trading mechanism nor was there analysis provided in response to the EPA's solicitation in the June 10, 2004 SNPR for input on: Transfer ratios, addressing two different environmental issues, and having slightly different annual NO_X and ozone season NO_X control regions. Furthermore, because the NO_X and SO_2 markets provide very flexible mechanisms for trading of the two pollutants, the EPA does not believe there is a compelling need to go further at this time. Therefore, EPA is not finalizing provisions in the CAIR model rules that specifically address interpollutant trades.

F. Are There Incentives for Early Reductions?

When sources reduce their SO_2 and NO_X emissions prior to the first phase of a multi-phase cap and trade program, it creates the emissions ''glide slope'' of a cap and trade approach that provides early environmental benefit and lowers the cost of compliance. Early reduction credits (ERCs) can provide an incentive for sources to install and/or operate controls before the implementation dates. Allowing emission allowances from existing programs to be used for compliance in the new program is another mechanism to encourage early reductions prior to the start of a cap and trade program. This section discusses the potential use of mechanisms to provide incentives for early reductions in the CAIR.

1. Incentives for Early SO_2 Reductions

a. The CAIR NPR and SNPR Proposal for the Model Rules and Input From Commenters

The January 30, 2004 CAIR NPR and June 10, 2004 CAIR SNPR acknowledge the benefit of early reductions and provide for the use of title IV SO_2 allowances of vintage years 2009 and earlier to be used for compliance in the CAIR at a one-to-one ratio. In other words, title IV allowances can be banked into the CAIR Program. This provides incentive for title IV sources to reduce their emissions in years 2009 and earlier because these allowances may be used for CAIR compliance without being discounted by the retirement ratios applied to the 2010 and later SO_2 allowances. No other mechanism, such as SO_2 ERCs were proposed by the EPA.

Comments Regarding the Incentives for Early SO_2 Reductions

The EPA received comments on incentives for early SO_2 reductions with the majority supporting the EPA proposal to encourage early emission reductions by allowing the CAIR sources to use 2009 and earlier vintage title IV SO_2 allowances for CAIR compliance. Some supporters noted concerns in meeting the CAIR's stringent Phase I SO_2 requirements as another reason to allow the banking of undiscounted, title IV allowances into the CAIR.

Some commenters expressed concern that achieving the SO_2 caps would be delayed if a large number of SO_2 allowances were being banked into the CAIR. Based upon experience with implementing the Acid Rain Program, the EPA acknowledged in the SNPR that crediting early reductions does create a glide slope—where emissions are reduced below the baseline before the implementation date and ''glide'' down to the ultimate cap level sometime after the program begins. This gradual reduction in emissions is a key component to cap and trade programs having lower cost of compliance than command-and-control approaches. One commenter proposed that the EPA needs to assess the likelihood that allowing the banking of undiscounted title IV allowances would delay the attainment of the Phase I SO_2 cap until Phase II. Because the EPA included this mechanism (*i.e.*, the use of 2009 and earlier vintage SO_2 allowances for compliance in the CAIR) in the policy case modeled as part of this rulemaking, EPA analysis includes the benefits and costs that would result from the level of SO_2 reductions that would take place with banking of undiscounted title IV allowances.

One commenter advocated the use of SO_2 ERCs. It was not clear whether these would be awarded in addition to banking title IV allowances into the CAIR or the ERC mechanism would take the place of banking SO_2 allowances into the CAIR.

b. SO_2 Early Reduction Incentives in the Final CAIR Model Rules

The CAIR SO_2 model rule allows CAIR sources to use title IV SO_2 allowances of vintage 2009 and earlier for compliance with the CAIR at a one-to-one ratio. This approach was part of the CAIR policy case assumptions used in the rulemaking modeling and the EPA has shown that the SO_2 cap and trade program, with this early incentive mechanism, will achieve the level of SO_2 reductions needed to meet the CAIR goals. These reductions take place on a glide slope that includes early emissions reductions as well as some use of the SO_2 allowance bank as sources gradually reduce emissions toward the cap levels.

The EPA did not include SO_2 ERCs because the Acid Rain Program cap and trade program, which affects a large segment of the CAIR source universe, makes it impossible to determine whether sources are reducing their SO_2

NMED Exhibit 7f

emissions below levels required by existing (*i.e.*, the Acid Rain Program) programs. Furthermore, given that most sources with substantial emissions receive SO_2 emission allowances under the Acid Rain Program, a significant number of SO_2 allowances are expected to be banked into the CAIR. These banked allowances would be available to CAIR sources in the early years of the program and make ERCs largely unnecessary.

2. Incentives for Early NO_X Reductions

a. The CAIR NPR and SNPR Proposal for the Model Rules and Input From Commenters

In the June 10, 2004 SNPR, the EPA proposed to provide incentives for early NO_X reductions by allowing the use of NO_X SIP Call allowances of vintage 2009 and earlier to be used for compliance in the CAIR. Further, the EPA did not propose, but solicited comment on the potential use of NO_X ERCs to provide an additional incentive for sources to reduce NO_X emissions prior to CAIR implementation. In addition to the general solicitation for comment on NO_X ERCs, the EPA solicited input on the following specific approaches that could be utilized: (1) The EPA could maintain the NO_X SIP Call requirements and allow sources to use ERCs only for compliance with the annual limitation, to ensure that ozone-season NO_X limitations are met. Under this scenario, the additional States subject to the CAIR that have been found to significantly contribute to ozone nonattainment may also have to be included in the ozone season cap; (2) the EPA could limit the period of time during which ERCs could be created and banked; (3) the EPA could cap the amount of ERCs that can be created; and (4) the EPA could apply a discount rate to ERCs.

Comments Regarding the Incentives for Early NO_X Reductions

The EPA did not receive comment on the proposed use of NO_X SIP Call allowances of vintage years 2009 and earlier for compliance in the CAIR. In fact, several commenters characterized the CAIR proposal as not including any incentives for early NO_X emissions reductions.

The EPA received several comments on the potential use of NO_X ERCs with the majority in favor of some sort of ERC mechanism. Several commenters advocated the use of ERCs to mitigate concerns that they would not be able to meet the stringent Phase I CAIR reduction requirements. One commenter wanted early reductions to facilitate the ozone attainment in 2010 but believed 2010 attainment could only be helped if there were some restrictions on the number of ERCs that could be created.

Some ERC supporters wanted credit for wintertime emissions reductions only, while a few believed that credit should be given for reductions at any time of year. One commenter advocated providing ERCs for wintertime reductions only as part of a broader proposal to create a bifurcated NO_X trading system (*i.e.*, separate wintertime and summertime allowances and trading markets).

Many of the commenters supporting the use of ERCs advocated that they be distributed from a pool of allowances similar to the CSP used in the NO_X SIP Call. (The NO_X SIP Call CSP was a fixed pool of NO_X allowances that were distributed on a first come-first serve, prorated, or need basis, depending upon the State). Commenters noted that the CSP approach has already been part of a litigated rulemaking and provides the added benefit of limiting the total number of allowances that can be distributed for early reductions. Other commenters proposed that should the final approach use a pool of allowances, this pool should not remove allowances from the existing State NO_X budget. Another commenter suggested that allowances from a CSP could be distributed based upon a NO_X emission rate, such as 0.25 lbs/mmBtu. Allowances could be distributed to any source emitting below the target emission rate.

Several commenters were concerned that too many NO_X ERCs (as well as NO_X SIP Call allowances) could be introduced into the CAIR and the ability of the NO_X cap and trade program to meet the annual and ozone-season reduction goals could be compromised. Some commenters suggested that crediting early reductions at a discount (*e.g.*, 2 tons of NO_X reductions earn 1 ERC) could mitigate this concern. Other commenters noted that a CSP-style mechanism also provides safeguards against an overabundance of ERCs. Another commmenter noted that restrictions on the use of ERCs similar to the progressive flow control (PFC) mechanism used in the NO_X SIP Call—PFC restricts the use of banked NO_X allowances for compliance in years where the NO_X bank is greater than 10 percent of the allocations—could help to ease concerns of flooding the market with NO_X ERCs.

One commenter believed that the EPA's projection that the potential pool of NO_X ERCs could be as large as 3.7 million tons (presented in the June 10, 2004 SNPR) is unrealistically high. The commenter contended that technical limitations of Selective Catalytic Reduction (SCR) operation would not permit facilities to simply run all of their SCRs year-round. More specifically, the commenter believes the lower operating loads, typically of the wintertime dispatch, would not meet the minimum conditions necessary for SCR operation (*i.e.*, at lower capacity the stack gas temperatures will not support the use of the catalyst). Fewer wintertime opportunities to operate the SCRs is believed by the commenter to result in a smaller projected ERC estimate. This was an estimate used for discussion purposes and was not directly used in the development of the CSP.

A few commenters advocated providing credits to any source that reduced emission rates below those used to determine the CAIR State budgets. One commenter suggested that the rates be based on those rates used to determine the NO_X SIP Call caps.

A few commenters proposed that the EPA should develop a strategy for crediting NO_X reductions from sources that have implemented control measures in response to State-level regulations that are more stringent than the NO_X SIP Call. Another commenter advocated only providing ERCs in States subject to both the NO_X SIP Call and the CAIR.

Some commenters did not support the use of NO_X ERCs in any form. These commenters believe that the use of ERCs would delay attainment of the CAIR emission caps.

b. NO_X Early Reduction Incentives in the Final CAIR Model Rules

The CAIR ozone-season NO_X cap and trade rule will allow the proposed use of NO_X SIP Call allowances of vintage years 2008 and earlier for compliance in the CAIR. This mechanism would provide incentive for sources in NO_X SIP Call States to reduce their ozone-season NO_X emissions and bank additional allowances into the CAIR. Because today's final ozone-season cap and trade rule includes a mandatory ozone-season NO_X cap in 2009 (this modification is discussed in section IV), the provisions to allow the banking of NO_X SIP Call allowances into the CAIR are adjusted to reflect this implementation date.

The CAIR annual NO_X cap and trade rule will provide additional incentives for early annual NO_X reductions by creating a CSP for CAIR States from which they can distribute allowances for early, surplus NO_X emissions reductions in the years 2007 and 2008. The earning of CAIR CSP allowances for

NMED Exhibit 7f

NO_X emission reductions does not begin until 2007 because this is the first year after the State SIP submittal deadlines. The CAIR CSP will provide a total of 200,000 [136] CAIR annual NO_X allowances of vintage 2009 in addition to the annual CAIR NO_X budgets.

The CAIR's CSP is patterned after the NO_X SIP Call's CSP, which is part of an established and extensively litigated rulemaking. Similarities include: Limiting the total number of allowances that can be distributed; limiting the years in which CSP allowances can be earned; populating the CSP with allowances vintaged the first compliance year; and using distribution criteria of early reductions and need.

The EPA will apportion the CSP to the States based upon their share of the final, regionwide NO_X CAIR reductions. Similar to the NO_X SIP Call, States may distribute these CAIR NO_X allowances to sources based upon either: (1) A demonstration by the source to the State of NO_X emissions reductions in surplus of any existing NO_X emission control requirements; or (2) a demonstration to the State that the facility has a "need" that would affect electricity grid reliability. Sources that wish to receive CAIR CSP allowances based upon a demonstration of surplus emissions reductions will be awarded one CAIR annual NO_X allowance for every ton of NO_X emissions reductions. (Should a State receive more requests for allowances than their share of the CAIR CSP, the State would pro-rate the allowance distribution.) Determination of surplus emissions must use emissions data measured using part 75 monitoring.

The EPA elected to include the CSP in response to several comments noting the benefit of early NO_X reductions and some commenters concerns in complying with the stringent Phase I CAIR NO_X cap. While EPA analysis has shown that sources had sufficient time to install NO_X emission controls, the EPA does believe that it would be appropriate to provide some mechanism to alleviate the concerns of some sources which may have unique issues with complying with the 2009 implementation deadline. In addition to mitigating some of the uncertainty regarding the EPA projections of resources to comply with CAIR, the CAIR CSP also effectively provides incentives for early, surplus NO_X reductions.

The EPA agrees with the comments that advocate allowing sources to earn CAIR annual NO_X allowances only for those reductions that are in surplus of the sources' existing NO_X reduction requirements. By allowing sources in NO_X SIP Call and non-NO_X SIP Call States to demonstrate that their year-round early reductions are truly "surplus" and, therefore, deserving of CSP allowances, the EPA is responding to comments that the EPA should allow sources in non-NO_X SIP Call States to receive credit for early reductions. Some commenters advocated crediting sources in the ozone-season NO_X cap and trade program that emitted below the emission rate used to determine the ozone-season budget. The EPA did not accept this recommendation because a source that is allowed to bank NO_X SIP Call allowances into the CAIR ozone-season NO_X program and receive early reduction credit from CAIR's CSP would be essentially "double-counting" that emission reduction.

The EPA did not restrict the use of the NO_X allowances awarded from the CSP because several aspects of the CSP already address concerns that too many total credits would be distributed and that they would flood the markets. First, the CSP is a finite pool of NO_X allowances. Second, by requiring sources to reduce one ton of NO_X emissions for every NO_X allowance awarded from the CSP ensures that significant reductions are made prior to the CAIR implementation date.

G. Are There Individual Unit "Opt-In" Provisions?

In the SNPR, EPA described a potential approach for allowing certain units to voluntarily participate in, or "opt-in," to the CAIR. Originally, EPA proposed to have no opt-in provision but included language in the SNPR on what a potential opt-in provision may look like. This "potential" opt-in provision would have allowed non-EGU boilers and turbines that exhaust to a stack or duct and monitor and report in accordance with part 75 to opt into the CAIR. The opt-in unit would have been required to opt-in for both SO_2 and NO_X. The allocation method for opt-ins assumed a percentage SO_2 reduction from a baseline and for NO_X, allocations were equal to a baseline heat input multiplied by a specified NO_X emissions rate, the same NO_X emissions rate EGUs were subject to in the assumed EGU budgets. Allocations were updated annually and after opting in units would have had to stay in the CAIR for a minimum of 5 years. The EPA received many comments in favor of and very few comments against including an opt-in provision in the final rule. As a result, EPA is including an opt-in provision in this final rule that is based on the approach described in the SNPR but includes several modifications and additions in response to comments as described below. In general, EPA believes there is value to including an opt-in provision but believes that sources that opt-in should be responsible for a certain level of reduction below its baseline because of the additional flexibility provided to that source by opting into a regional trading program and because of the possibility that participation in the CAIR may reduce or eliminate future potential required reductions. Therefore, the following opt-in approach has as its goals to provide more flexibility to the units opting in as well as to potentially provide more cost-effective reductions for the affected EGUs but also to ensure a certain level of reduction from the units opting into the program.

1. Applicability

Some commenters suggested that the opt-in provision not be limited to boilers and turbines but should be open to any unit. The EPA strongly believes that any unit participating in an emissions trading program be subject to accurate and reliable monitoring and reporting requirements. This is the purpose of part 75. The EPA has developed criteria for boilers and turbines to satisfy the requirements of part 75 but has not developed criteria for all non-boilers and turbines and, therefore, cannot be confident their emissions can be monitored with the high degree of accuracy and reliability required by a cap-and-trade program. Continuous Emissions Monitoring Systems or "CEMS" are typically what is required by EPA to participate in a cap-and-trade program.

In response to comments received suggesting that non-boilers and turbines be allowed to opt-in, EPA is expanding applicability of the opt-in provision to include, in addition to boilers and turbines, other fossil fuel-fired combustion devices that vent all emissions through a stack and meet monitoring, recordkeeping, and recording requirements of part 75.

2. Allowing Single Pollutant

Some commenters suggested that sources should be allowed to opt-in for only one pollutant instead of requiring the source to opt-in for both SO_2 and NO_X as EPA proposed. These commenters argued that some sources may only emit significant amounts of one of the two regulated pollutants and that it would not make sense to require reductions in both pollutants from such

[136] The 200,000 ton pool includes the 1,503 tons that would be DE and NJ's share. Section V of today's action describes in detail the State-by-State apportionment of the total CSP.

NMED Exhibit 7f

a source. The EPA agrees with this comment and will allow units to opt-in for one pollutant, *i.e.*, NO_X, SO_2, or both. Another commenter suggested that EPA allow non-EGUs subject to the NO_X SIP Call to opt into the CAIR for NO_X only without requiring any reductions in SO_2. This commenter argued that these non-EGUs could simply turn on their SCRs during the non-ozone season and easily achieve significant NO_X reductions. The EPA agrees that the relatively small number of non-EGUs subject to the NO_X SIP Call that have SCRs could achieve significant NO_X reductions by operating their SCRs during the non-ozone season. As stated above, EPA is allowing sources to opt-in for one pollutant and thus non-EGUs subject to the NO_X SIP call may opt-in for NO_X only.

3. Allocation Method for Opt-Ins

In the SNPR, EPA proposed allocating allowances to opt-in units on a yearly basis. The amount of allowances allocated would be calculated by multiplying an emission rate by the lesser of a baseline heat input or the actual heat input monitored at the unit in the prior year.

The baseline heat input would be calculated by using the most recent 3 years of quality-assured part 75 monitoring data. When less than 3 years of quality-assured part 75 monitoring data is available, the heat input would be based on quality-assured part 75 monitoring data from the year before the unit opted in.

For SO_2, EPA proposed that the emission rate used to calculate allocations would be the lesser of, the most stringent State or Federal SO_2 emission rate that applied in the preceding year or the emission rate representing 50 percent of the unit's baseline SO_2 emission rate (in lbs/mmBtu) for the years 2010 through 2014 and 35 percent of the unit's baseline SO_2 emission rate (in lbs/mmBtu) for 2015 and beyond. For NO_X, EPA proposed that the emission rate would be the lower of the unit's baseline emission rate, the most stringent State or Federal NO_X emission limitation that applies to the opt-in unit at any time during the calender year prior to opting into the CAIR Program, or 0.15 lb/mmBtu for the years 2010 through 2014 and 0.11 lbs/mmBtu for the years 2015 and beyond.

In today's final rule, EPA is making a number of changes to its proposed methodology for calculating allocations for opt-in units.

With regards to baseline heat input, EPA is requiring that sources may only use part 75 monitored data for years in which they have maintained at least a 90 percent monitor availability. The EPA is making this change because part 75 contains missing data provisions that require substitution of data when monitors are unavailable. When units have low monitor availability, units are required to report more conservative (*e.g.*, higher) heat input values. This is to provide an incentive to maintain high monitor availability (since under a cap and trade program sources would be required to turn in more allowances if they reported higher emissions). When setting baselines, sources have the opposite incentive, reporting a higher heat input would result in a higher baseline and thus a greater allocation.

With regards to the SO_2 emission rate used to calculate allocations, EPA is requiring that the emission rate used to calculate allocations would be the lesser of, the most stringent State or Federal SO_2 emission rate that applies to the unit in the year that the unit is being allocated for, or the emission rate representing 70 percent of the unit's baseline SO_2 emission rate (in lbs/mmBtu). The EPA is changing the percentage emission reduction upon which allocations are based because some commenters suggested that instead of using percentage emission reduction requirements that are the same as the requirements for EGUs as a basis for allocating to opt-ins, EPA should require emissions reductions based on similar marginal cost of control. The EPA agrees with the basic concept that emissions reductions for opt-ins should be based on similar marginal costs. One commenter submitted results from a study of industrial boiler NO_X and SO_2 control costs that indicated the use of similar marginal cost of control would result in approximately a 30 percent reduction in NO_X and SO_2 by 2010. While the commenter provided limited data to allow EPA to evaluate the commenter's estimates, EPA is using this percentage reduction requirement for the opt-in provision. The same commenter stated that it may be possible to achieve more than a 30 percent reduction in SO_2 and NO_X by 2015 by employing future unspecified technology advances. Because these future technology advances are not specified nor demonstrated, EPA is not requiring more than a 30 percent reduction in SO_2 and NO_X in 2015 and beyond for opt-ins. The EPA is changing the requirement to use the lowest required emission rate for the year preceding the year in which allowances are being allocated to the lowest emission rate for the year in which allowances are being allocated. The EPA is making this change because EPA believes that such data should be available and that this more accurately reflects the intent of the rule to ensure that the source is not being allocated a greater number of allowances than the emissions a source would be allowed to emit under the regulations it is subject to in the year the allocations are being made. The EPA is finalizing parallel provisions with respect to NO_X.

4. Alternative Opt-In Approach

Some commenters suggested that EPA include an alternative approach to opting into the CAIR. This alternative would allow units to opt-in as early as 2009 for NO_X and 2010 for SO_2 and receive allocations at their current emission levels in return for a commitment to make deeper reductions by 2015 than would be required under the general opt-in provision described above. Therefore, for the years 2010 through 2014, the unit would be allocated allowances based on the same heat input used under the general opt-in provision (*e.g.*, the lesser of the baseline heat input or the heat input for the year preceding the year in which allocations are being made) multiplied by an emission rate. This emission rate would be the lower of the emission rate for the year or years before the unit opted in or the most stringent State or Federal emission rate required in the year that the unit opts in. For SO_2 for the years 2015 and beyond, the unit would be allocated allowances based on the same heat input multiplied by an emission rate. This emission rate would be the lower of a 90 percent reduction from the baseline emission rate or the most stringent State or Federal emission rate required in the baseline year. For NO_X, the same methodology would be used, except that the emission rate used for the years 2015 and beyond would be the lower of 0.15 lbs/mmBtu or the most stringent State or Federal emission rate required in the baseline year. The EPA believes the environmental benefit of achieving deeper emissions reductions in the future (2015) from sources that may otherwise not make such deep emissions reductions is worth including in this final rule.

5. Opting Out

In the SNPR, EPA proposed that opt-in units be required to remain in the program a minimum of 5 years after which time they could voluntarily withdraw from the CAIR. Some commenters expressed concern over this proposed approach, arguing that because EGUs affected by the CAIR are not allowed to voluntarily withdraw from the CAIR that opt-in sources should not be allowed to voluntarily withdraw either. The EPA recognizes that opt-in sources such as industrial boilers and turbines tend to be more sensitive to changing market forces than EGUs. As a result, EPA believes it is appropriate to allow opt-in sources who voluntarily participate in an emissions reductions program to be able to end their participation or (''opt-out'') after a specified period of time. As proposed, EPA believes a period of 5 years is appropriate and is finalizing a rule to allow opt-in sources to opt-out after participating in the CAIR for 5 years. This option to opt-out after 5 years does not apply to sources that opt-in under the alternative approach. Sources that opt-in under the alternative approach may not opt-out at any time.

6. Regulatory Relief for Opt-In Units

The CAIR does not offer relief from other regulatory requirements, existing or future, for units that opt-in to the CAIR cap and trade program. Any revision of requirements for other, non-CAIR programs would be done under rulemakings specific to those programs.

As discussed above, EPA is including two different approaches for opt-in units to follow, a general and an alternative approach. The EPA is including both approaches in this final rule in response to comments supportive of including an alternative means and to provide greater flexibility for sources to participate in the CAIR trading program. Opt-in sources may select which approach is more appropriate for their particular situation. An opt-in source may not switch from one approach to the other once in the program. States have the flexibility to choose to include both of these approaches, one of these approaches, or none of them in their SIPs. EPA is not requiring States to include an individual unit opt-in provision because the participation of individual opt-in units is not required to meet the goals of the CAIR. However, States cannot choose to have an individual unit opt-in approach different than what EPA has finalized in this rule and still participate in the inter-State trading program administered by EPA.

H. What Are the Source-Level Emissions Monitoring and Reporting Requirements?

In the NPR, the EPA proposed that sources subject to the CAIR monitor and report NO_X and SO_2 mass emissions in accordance with 40 CFR part 75.

The model trading rules incorporate part 75 monitoring and are being finalized as proposed. The majority of CAIR sources are measuring and reporting SO_2 mass emissions year round under the Acid Rain Program, which requires part 75 monitoring. Most CAIR sources are also reporting NO_X mass emissions year round under the NO_X SIP Call. The CAIR-affected Acid Rain sources that are located in States that are not affected by the NO_X SIP Call currently measure and report NO_X emission rates year round, but do not currently report NO_X mass emissions. These sources will need to modify only their reporting practices in order to comply with the proposed CAIR monitoring and reporting requirements.

Because so many sources are already using part 75 monitoring, there were very few comments on the source-level monitoring requirements in this rulemaking. The comments the EPA received related to sources not currently monitoring under part 75. Commenters suggested that alternative forms of monitoring (*e.g.*, part 60 monitoring) would be appropriate for these sources. The EPA disagrees. Consistent, complete and accurate measurement of emissions ensures that each allowance actually represents one ton of emissions and that one ton of reported emissions from one source is equivalent to one ton of reported emissions from another source. Similarly, such measurement of emissions ensures that each single allowance (or group of SO_2 allowances, depending upon the SO_2 allowance vintage) represents one ton of emissions, regardless of the source for which it is measured and reported. This establishes the integrity of each allowance, which instills confidence in the underlying market mechanisms that are central to providing sources with flexibility in achieving compliance. Part 75 has flexibility relating to the type of fuel and emission levels as well as procedures for petitioning for alternatives. The EPA believes this provides the requested flexibility.

Should a State(s) elect to use the example allocation approach, the EPA would modify the part 75 monitoring and reporting requirements to collect information used in determining the allowance allocations for Combined Heat and Power (CHP) units. More specifically, provisions for the monitoring and reporting of the BTU content of the steam output would be added to the existing requirements. The information on electricity output currently reported under part 75 would not need to be revised to allow States to implement the example allowance allocation approach.

In the SNPR, the EPA proposed continuous measurement of SO_2 and NO_X emissions by all existing affected sources by January 1, 2008 using part 75 certified monitoring methodologies. New sources have separate deadlines based upon the date of commencement of operation, consistent with the Acid Rain Program. These deadlines are finalized as proposed.

I. What Is Different Between CAIR's Annual and Seasonal NO_X Model Cap and Trade Rules?

Today's action finalizes not only the proposed CAIR annual NO_X program and annual SO_2 program, but also a CAIR ozone-season NO_X program. Because the CAIR ozone-season NO_X program is the only ozone-season NO_X cap and trade program that the EPA will administer, NO_X SIP Call States wishing to meet their NO_X SIP Call obligations through an EPA-administered regional NO_X program will also use the CAIR ozone-season rule. The EPA believes that States and affected sources will benefit from having a single, consistent regional NO_X cap and trade program. This section of today's action highlights any key differences between the CAIR ozone-season NO_X model rule and the NO_X SIP Call model rule, as well as the CAIR annual and ozone-season NO_X model rules.

Differences Between the CAIR Ozone-Season NO_X Model Rule and the NO_X SIP Call Model Rule

While the CAIR ozone-season NO_X model rule closely mirrors the NO_X SIP Call rule (as does the other CAIR rules), the EPA has incorporated into the CAIR model rules its experience with implementing trading programs (including seasonal NO_X programs). These modifications include the following.

A. Unrestricted banking: The CAIR ozone-season NO_X model rule will not include any restrictions on the banking of NO_X SIP Call allowances (vintages 2008 and earlier) or CAIR ozone-season NO_X allowances. The NO_X SIP Call rules include ''progressive flow control'' provisions that reduce the value of banked allowances in years where the bank is above a certain percentage of the cap. (See section VIII.E.1 of today's rule for a detailed discussion).

B. Facility level compliance: The CAIR ozone-season NO_X model rule will allow sources to comply with the allowance holding requirements at the facility level. The NO_X SIP Call rules required unit-by-unit level compliance with certain types of allowance accounts providing some flexibility for sources with multiple affected units. (See the June 2004 SNPR, section IV for a detailed discussion).

The EPA believes that these changes improve the programs and that both CAIR and NO_X SIP Call affected sources

NMED Exhibit 7f

will benefit from complying with a single, regionwide cap and trade program.

Differences Between the CAIR Ozone-Season and Annual NO_X Model Rules

The CAIR ozone-season and annual NO_X model rules are designed to be identical with the exception of (1) provisions that relate to compliance period and (2) the mechanism for providing incentives for early NO_X reductions. For compliance related provisions, the EPA attempted to maintain as much consistency as possible between the CAIR annual and ozone-season NO_X model rules. For example, reporting schedules remain synchronized (*i.e.*, quarterly reporting) for both of the CAIR NO_X model rules. For the annual and ozone-season NO_X model rules, the EPA did define 12 month and 5 month compliance periods, respectively.

Incentives for early NO_X reductions differ between the CAIR annual and ozone-season programs. For the annual NO_X program, early reductions may be rewarded by States through a CSP. (See section VIII.F.2 of today's action for a detailed discussion.) The CAIR ozone-season NO_X model rule provides incentive for early emissions reductions by allowing the banking of pre-2009 NO_X SIP Call allowances into the CAIR ozone-season program.

J. Are There Additional Changes to Proposed Model Cap and Trade Rules Reflected in the Regulatory Language?

The proposed and final rules are modeled after, and are largely the same as, the NO_X SIP Call model trading rule. Today's final rule includes some relatively minor changes to the model rules' regulatory text that improve the implementability of the rules or clarify aspects of the rules identified by the EPA or commenters. (Note that sections VIII.B through VIII.H of today's action highlight the more significant modifications included in the final model rules).

One example of a relatively minor change is the inclusion of language in the SO_2 model rule that implements the retirement ratio (2.00) used for allowances allocated for 2010 to 2014 and the retirement ratio (2.86) used for allowances allocated for 2015 and later, that clarifies the compliance deduction process and that provides for rounding-up of fractional tons to whole tons of excess emissions. More specifically, the definition of ''CAIR SO_2 allowance'' states that an allowance allocated for 2010 to 2014 authorizes emissions of 0.50 tons of SO_2 and that an allowance allocated for 2015 or later authorizes emissions of 0.35 tons of SO_2—which corresponds with the 2.86 retirement ratio.

Other, less significant modifications were also included in the regulatory text of the final model rules. These include:

C. Units and sources are identified separately for NO_X and SO_2 programs (*e.g.*, CAIR NO_X units, CAIR Nox ozone season units, and CAIR SO_2 units) since States can participate in one, two, or three trading programs;

D. The definition of ''nameplate capacity'' is clarified;

E. The language on closing of general accounts is clarified; and,

F. Process of recordation of CAIR SO_2 allowance allocations and transfers on rolling 30-year periods is added to make it consistent with Acid Rain regulations.

Another example of where today's final model trading rules incorporate relatively minor changes from the proposed model trading rules involves the provisions in the standard requirements concerning liability under the trading programs. The proposed CAIR model NO_X and SO_2 trading rules include, under the standard requirements in § 96.106(f)(1) and (2) and § 96.206(f)(1) and (2), provisions stating that any person who knowingly violates the CAIR NO_X or SO_2 trading programs or knowingly makes a false material statement under the trading programs will be subject to enforcement action under applicable State or Federal law. Similar provisions are included in § 96.6(f)(1) and (2) of the final NO_X SIP Call model trading rule. The final CAIR model NO_X and SO_2 trading rules exclude these provisions for the following reasons. First, the proposed rule provisions are unnecessary because, even in their absence, applicable State or Federal law authorizes enforcement actions and penalties in the case of knowing violations or knowing submission of false statements. Moreover, these proposed rule provisions are incomplete. They do not purport to cover, and have no impact on, liability for violations that are not knowingly committed or false submissions that are not knowingly made. Applicable State and Federal law already authorizes enforcement actions and penalties, under appropriate circumstances, for non-knowing violations or false submissions. Because the proposed rule provisions are unnecessary and incomplete, the final CAIR model NO_X and SO_2 trading rules do not include these provisions. However, the EPA emphasizes that, on their face, the provisions that were proposed, but eliminated in the final rules, in no way limit liability, or the ability of the State or the EPA to take enforcement action, to only knowing violations or knowing false submissions.

IX. Interactions With Other Clean Air Act Requirements

A. How Does This Rule Interact With the NO_X SIP Call?

A majority of States affected by the CAIR are also affected by the NO_X SIP Call. This section addresses the interactions between the two programs.

The EPA proposed that States achieving all of the annual NO_X reductions required by the CAIR from only EGUs would not need to continue to impose seasonal NO_X limitations on EGUs from which they required reductions for purposes of complying with the NO_X SIP Call. Also, EPA proposed that States would have the option of retaining such seasonal NO_X limitations. The EPA also proposed to keep the NO_X SIP Call in place for non-EGUs currently subject to the NO_X SIP Call and to continue working with States to run the NO_X SIP Call Budget Trading Program for all sources that would remain in the program. In response to commenters, EPA is making several modifications to its proposed approach.

States Affected by the CAIR for Ozone and $PM_{2.5}$ Will Be Subject to a Seasonal and an Annual NO_X Limitation

A number of commenters recommended leaving the current NO_X SIP Call ozone season NO_X limitation in place as a way to ensure that ozone season NO_X reductions from EGUs required by the NO_X SIP Call would continue to be achieved. Some commenters argued this would also help non-EGUs currently subject to the NO_X SIP Call by allowing them to continue trading with EGUs in a seasonal NO_X program. Many of the same commenters suggested a dual-season or bifurcated CAIR trading program as a mechanism for maintaining an ozone season NO_X limitation for EGUs under the CAIR. In response to these commenters, EPA is requiring that States subject to the CAIR for $PM_{2.5}$ be subject to an annual limitation and that States subject to the CAIR for ozone be subject to an ozone season limitation. This means that States subject to the CAIR for both $PM_{2.5}$ and ozone are subject to both an annual and an ozone season NO_X limitation. The annual and ozone season NO_X limitations are described in section IV. States subject to the CAIR for ozone only are only subject to an ozone season NO_X limitation. To implement these NO_X limitations, EPA will establish and operate two NO_X trading programs, *i.e.*,

NMED Exhibit 7f

a CAIR annual NO_X trading program and a CAIR ozone season NO_X trading program. The CAIR ozone season NO_X trading program will replace the current NO_X SIP Call as discussed in more detail later in this section.

What Will Happen to Non-EGUs Currently in the NO_X SIP Call?

A number of commenters were concerned that the cost of compliance for non-EGUs in the NO_X SIP Call would increase if they were not allowed to continue to trade with EGUs. In response to these commenters, EPA is modifying its proposed approach. The EPA is allowing States affected by the NO_X SIP Call that wish to use EPA's model trading rule to include non-EGUs currently covered by the NO_X SIP Call in the CAIR ozone season NO_X trading program. This will ensure that non-EGUs in the NO_X SIP Call will continue to be able to trade with EGUs as they currently do under the NO_X SIP Call. This will not require States to get additional reductions from non-EGUs. Budgets for these units would remain the same as they are currently under the NO_X SIP Call. States will, however, be required to modify their existing NO_X SIP Call regulations to reflect the replacement of the NO_X SIP Call with the CAIR ozone season NO_X trading program. The EPA will continue to operate the NO_X SIP Call trading program until implementation of the CAIR begins in 2009. The EPA will no longer operate the NO_X SIP Call trading program after the 2008 ozone season and the CAIR ozone season NO_X trading program will replace the NO_X SIP Call trading program. If States affected by the NO_X SIP Call do not wish to use EPA's CAIR ozone season NO_X trading program to achieve reductions from non-EGU boilers and turbines required by the NO_X SIP Call, they would be required to submit a SIP Revision deleting the requirements related to non-EGU participation in the NO_X SIP Call Budget Trading Program and replacing them with new requirements that achieve the same level of reduction.

Compliance With the NO_X SIP Call for States That Are Subject to Both the CAIR Ozone Season NO_X Reduction Requirements and the NO_X SIP Call

If the only changes a State makes with respect to its NO_X SIP Call regulations are: (1) To bring non-EGUs that are currently participating in the NO_X SIP Call Budget Trading Program into the CAIR ozone season program using the same non-EGU budget and applicability requirements that are in their existing NO_X SIP Call Budget Trading Program; and (2) to achieve all of the emissions reductions required under the CAIR from EGUs by participating in the CAIR ozone season NO_X trading program, EPA will find that the State continues to meet the requirements of the NO_X SIP Call.

If the only changes a State makes with respect to its NO_X SIP Call regulations are not those described above, see section VII for a discussion of how the State would satisfy its NO_X SIP Call obligations.

States in the NO_X SIP Call But Not Affected by the CAIR (Rhode Island)

Rhode Island is the only State in the NO_X SIP Call that is not affected by the CAIR. To continue meeting its NO_X SIP Call obligations in 2009 and beyond, Rhode Island will have two choices. It may either modify its NO_X SIP Call trading rule to conform to the new CAIR ozone season NO_X trading rule if it wishes to allow its sources to continue to participate in an interstate NO_X trading program run by EPA or, it will need to develop an alternative method for obtaining the required NO_X SIP Call reductions. In either case, Rhode Island must continue to meet the budget requirements of the existing NO_X SIP Call.

Use of Banked SIP Call Allowances in the CAIR Program

As explained earlier in today's final rule, banked allowances from the NO_X SIP Call may be used in the CAIR ozone season NO_X trading program.

Other Comments and EPA's Responses

One commenter wrote that because attainment demonstrations for early action compacts were made based on having EGUs and non-EGUs together in the NO_X SIP Call, EPA could not allow EGUs to leave the NO_X SIP Call and still have valid early action compacts (EACs). As discussed above, EPA is allowing States to keep EGUs and non-EGUs in the NO_X SIP Call together in one ozone season program (CAIR ozone season trading program). The NO_X reductions required by the CAIR ozone season trading program are slightly more stringent than the reductions required by the NO_X SIP Call. As a result, the attainment demonstrations for EACs would remain valid under the CAIR. Having said that, the EAC program will have ended (April 2008) before the CAIR rule is implemented. Thus, the compacts will no longer be applicable when the CAIR takes effect.

Another commenter proposed to have non-EGUs under the NO_X SIP Call subject to an annual NO_X cap similar to EGUs under the CAIR so that non-EGUs could continue to trade with EGUs. By adopting a CAIR ozone season trading program that includes non-EGUs covered by the NO_X SIP Call, non-EGUs will be able to continue to trade with EGUs.

B. How Does This Rule Interact With the Acid Rain Program?

As EPA developed this regulatory action, much consideration was given to interactions between the existing title IV Acid Rain Program and today's action designed to achieve significant reductions in SO_2 emissions beyond title IV. Requiring sources to reduce emissions beyond what title IV mandates has both environmental and economic implications for the existing title IV SO_2 cap and trade program. In the absence of an approach for taking account of the title IV program, a new program (*i.e.*, the CAIR) that imposes a significantly tighter cap on SO_2 emissions for a region encompassing most of the sources and most of the SO_2 emissions covered by title IV would likely result in a significant excess in the supply of title IV allowances, a collapse of the price of title IV allowances, disruption of operation of the title IV allowance market and the title IV SO_2 cap and trade system, and the potential for increased SO_2 emissions. The potential for increased emissions would exist in the entire country for the years before the CAIR implementation deadline and would continue after implementation for States not covered by the CAIR. These negative impacts, particularly those on the operation of the title IV cap and trade system, would undermine the efficacy of the title IV program and could erode confidence in cap and trade programs in general.

Title IV has successfully reduced emissions of SO_2 using the cap and trade approach, eliminating millions of tons of SO_2 from the environment and encouraging billions of dollars of investments by companies in pollution controls to enable the sale of allowances reflecting excess emissions reductions and in allowance purchases for compliance. In view of these already achieved reductions and existing investments under title IV, the likelihood of disruption of the allowance market and the title IV cap and trade system, and the potential for SO_2 emission increases, it is necessary to consider ways to preserve the environmental benefits achieved under title IV and maintain the integrity of the market for title IV allowances and the title IV cap and trade system. The EPA maintains that it is appropriate to provide States the opportunity to achieve the SO_2 emission reductions

NMED Exhibit 7f

required under today's action by building on, and avoiding undermining, this existing, successful program.

The EPA has developed, in the model SO_2 cap and trade rule, an approach to build on and coordinate with the title IV SO_2 program to ensure that the required reductions under today's action are achieved while preserving the efficacy of the title IV program. The EPA's approach provides States the opportunity to impose more stringent control requirements for EGUs' SO_2 emissions than under title IV through an EPA-administered cap and trade program that requires the use of title IV allowances for compliance at a ratio of 2 allowances per ton of emissions for allowances allocated for 2010 through 2014 and 2.86 allowances per ton of emissions for allowances allocated for 2015 or thereafter. (The program also allows the use of banked title IV allowances allocated for years before 2010 to be used at a ratio of 1 allowance per ton of emissions.) Title IV allowances continue to be freely transferable among sources covered by the Acid Rain Program and sources covered by the model SO_2 cap and trade program under CAIR. However, each title IV allowance used to comply with a source's allowance-holding requirement in the CAIR model SO_2 cap and trade program is removed from the source's allowance tracking system account and cannot be used again for compliance, either in the CAIR model SO_2 cap and trade program or the Acid Rain Program.

In addition, as discussed above, if a State wants to achieve the SO_2 emissions reductions required by today's action through more stringent EGU emission limitations only but without using the model cap and trade program, then EPA is requiring that the State include in its SIP a mechanism for retiring the excess title IV allowances that will result from imposition of these more stringent EGU requirements. In this case, the State must retire an amount of title IV allowances equal to the total amount of title IV allowances allocated to the units in the State minus the amount of title IV allowances equivalent to the tonnage cap set by the State on SO_2 emissions by EGUs, and the State can choose what retirement mechanism to use.

Further, as discussed above, if a State wants to meet the SO_2 emissions reductions requirement in today's action through reductions by both EGUs and non-EGUs, then EPA is also requiring the State's SIP to include a mechanism for retiring excess title IV allowances. In that case, the amount of title IV allowances that must be retired equals the total amount of title IV allowances allocated to the units in the State minus the amount of title IV allowances equivalent to the tonnage cap set by the State on EGU SO_2 emissions, and the State can choose what retirement mechanism to use.

Finally, as discussed above, if the State wants to achieve the SO_2 emissions reductions requirement in today's action through reductions by non-EGUs only, then EPA is not imposing any requirement to retire title IV allowances.

1. Legal Authority for Using Title IV Allowances in CAIR Model SO_2 Cap and Trade Program

The EPA maintains that it has the authority to approve and administer, if requested by a State in the SIP submitted in response to today's action, the new CAIR model SO_2 cap and trade program meeting the SO_2 emission reduction requirement in today's action that requires use of title IV allowances to comply with the more stringent allowance-holding requirement of the new program and retirement under the CAIR SO_2 cap and trade program and the Acid Rain Program of title IV allowances used for such compliance. Some commenters claim that EPA's establishment of such a cap and trade program using title IV allowances that sources must hold generally at a ratio of greater than one allowance per ton of SO_2 emissions is contrary to title IV. Most of these commenters prefer the approach of allowing States to use a new EPA-administered cap and trade program to meet lawful emission reduction requirements under title I and of allowing (but not requiring) sources to use title IV allowances in the new program. However, these commenters argue that title IV prohibits requiring sources to use title IV allowances in such a program, whether at the same tonnage authorization (*i.e.*, one allowance per ton of emissions) established in title IV or at a different tonnage authorization. Other commenters state that title IV does not bar EPA from establishing a new cap and trade program that requires the use of title IV allowances.

The EPA maintains that it has the authority under section 110(a)(2)(D) and title IV to establish a new cap and trade program requiring the use of title IV allowances at a different tonnage authorization than under the Acid Rain Program and the retirement of such allowances for purposes of both programs. First, as discussed in section V above, EPA has the authority under section 110(a)(2)(D) to establish a new SO_2 cap and trade program, administered by EPA if requested in a State's SIP, to prohibit emissions that contribute significantly to nonattainment, or interfere with maintenance, of the $PM_{2.5}$ NAAQS. Further, EPA notes that under section 402(3), a title IV allowance is:

> An authorization, allocated to an affected unit by the Administrator under this title [IV], to emit, during or after a specified calendar year, one ton of sulfur dioxide. 42 U.S.C. 7651(a)(3).

However, section 403(f) states that:

> An allowance allocated under this title is a limited authorization to emit sulfur dioxide in accordance with the provision of this title [IV]. Such allowance does not constitute a property right. Nothing in this title [IV] or in any other provision of law shall be construed to limit the authority of the United States to terminate or limit such authorization. Nothing in this section relating to allowances shall be construed as affecting the application of, or compliance with, any other provision of this Act to an affected unit or source, including the provisions related to applicable National Ambient Air Quality Standards and State implementation plans. 42 U.S.C. 7651b(f).

The EPA interprets the reference in section 403(f) to the authority of the ''United States'' to terminate or limit the authorization otherwise provided by a title IV allowance to mean that EPA (acting in accordance with its authority under other provisions of the CAA), as well as Congress, has such authority.[137]

[137] The EPA's interpretation is based on the language of section 403(f) and the legislative history of the provision. The language in CAA section 403(f) contrasts with language that was in section 503(f) of the House bill—but was excluded from the final version of the CAA Amendments of 1990—referring to the authority of the ''United States'' to terminate or limit such authorization ''by Act of Congress'' and stating that ''[a]llowances under this title may not be extinguished by the Administrator.'' U.S. Senate Committee on Environment and Public Works, *A Legislative History of The Clean Air Act Amendments of 1990* (*Legis. Hist. of CAAA*), S. Prt. 38, 103d Cong., 1st Sess., Vol. II at 2224 (Nov. 1993). Further, unlike CAA section 403(f), the House bill did not state that an allowance did not constitute a property right. Section 403(f) of the Senate bill that was considered, along with the House bill, in conference committee had language different than both CAA section 403(f) and the House bill and stated that ''allowances may be limited, revoked or otherwise modified in accordance with the provisions of this title or other authority of the Administrator'' and that an allowance ''does not constitute a property right.'' *Legis. Hist. of CAAA,* Vol. III at 4598. While the scope of the reference to the ''United States'' in CAA section 403(f) is not clear, EPA maintains that the term is clearly broad enough to include the Administrator. Moreover, even if the term were considered ambiguous with regard to the Administrator, EPA believes that interpreting the term to include the Administrator is reasonable. Specifically, EPA maintains that, by eliminating the explicit House bill language that required Congressional action and including the general reference to the ''United States'' and the ''not a property right'' language, CAA section 403(f)

Continued

NMED Exhibit 7f

Therefore, EPA maintains that it has the authority to establish a new cap and trade program in accordance with section 110(a)(2)(D) that requires: the holding of title IV allowances under a more limited authorization (*i.e.*, 2 or 2.86 allowances per ton of emissions) by sources in States participating in the new program; and the termination of the authorization through retirement under the new program and the Acid Rain Program of those title IV allowances used to meet the allowance-holding requirement of the new program.

Commenters' Arguments Based on Title IV

The commenters claiming that EPA is barred by title IV from requiring use of title IV allowances at a reduced tonnage authorization in a new cap and trade program rely on the above-noted provision in section 402(3) stating that an allowance is an authorization to emit one ton of SO_2. However, this provision does not bar EPA from requiring either: use of title IV allowances in a new cap and trade program under a different title of the CAA at a reduced tonnage authorization; or retirement in this new program and the Acid Rain Program of allowances used in this manner.

At the outset, it should be noted that the CAIR model SO_2 cap and trade program does not change the tonnage authorization of individual title IV allowances for purposes of the Acid Rain Program until such an allowance is used to meet the allowance-holding requirement of the CAIR SO_2 program. The authorization provided by each title IV allowance for a source to emit one ton of SO_2 emissions, as well as the requirement that each source hold title IV allowances covering annual SO_2 emissions, continue to be in effect in the Acid Rain Program whether or not the source is also covered by the CAIR SO_2 program. In fact, the Acid Rain Program regulations continue to reflect both this tonnage authorization and this allowance-holding requirement.[138] See final revisions to 40 CFR § 73.35 adopted in today's action. Moreover, the CAIR model SO_2 cap and trade rule coordinates the determinations—made by EPA for sources subject to both title IV and the CAIR—of compliance with the title IV and CAIR allowance-holding requirements so that such determinations are made in a multi-step, end-of-year process of comparing allowances held and emissions. First, EPA determines whether the source holds sufficient title IV allowances to comply with the one-allowance-per-ton-of-emissions requirement in the Acid Rain Program as provided in § 73.35; and subsequently EPA determines whether the source holds the additional title IV allowances that, when added to those held for Acid Rain Program compliance, are sufficient to meet the CAIR allowance-holding requirement. Violations of the Acid Rain allowance-holding requirement will result in imposition of the penalty for excess emissions (*i.e.*, the one-allowance offset plus $2,000 (inflation-adjusted) per ton of excess emissions) under CAA section 411 and §§ 73.35(d) and 77.4. *See* final § 96.254(b)(1) adopted in today's action. Thus, the Acid Rain allowance-holding requirement continues as a separate requirement and reflects the one-allowance-per-ton-of-emissions authorization under section 402(3).[139]

In contrast with the one-allowance-per-ton-of-emissions requirement under the Acid Rain Program, the CAIR SO_2 cap and trade program requires each source generally to hold 2 or 2.86 Acid Rain allowances for each ton of SO_2 emissions. Contrary to the commenters' claim, this CAIR allowance-holding requirement is not barred by the definition of the term "allowance" in section 402(3). While section 402(3) defines the term "allowance" as an authorization to emit one ton of SO_2, this provision expressly applies the definition to the term "[a]s used in this title [IV]" and therefore does not apply to the treatment of title IV allowances in a different program under a different title of the CAA. Moreover, as noted above, section 403(f) allows EPA to limit (or terminate) the authorization to emit that an allowance otherwise provides under section 402(3). Consequently, the allowance definition in section 402(3) does not bar the treatment of a title IV allowance as authorizing less than one ton of SO_2 emissions under the CAIR SO_2 cap and trade program established under title I.[140]

Once a title IV allowance is used to meet the more stringent allowance-holding requirement in the CAIR SO_2 program, that allowance is deducted from the source's allowance tracking system account and cannot be used again, either in the CAIR SO_2 program or the Acid Rain Program. As noted above, EPA has the authority under section 403(f) to require this termination of such a title IV allowance's tonnage authorization for purposes of the Acid Rain Program.

In addition to referencing section 402(3) to support claims that EPA is barred from adopting the CAIR model cap and trade program provisions on the use of title IV allowances, the commenters rely on other title IV provisions that they characterize as setting a "title IV cap" on SO_2 emissions. Stating that the requirement to use title IV allowances in the CAIR model SO_2 cap and trade program has the effect of reducing the "title IV cap," these commenters indicate, with little explanation, that such requirement is unlawful. In mentioning the title IV cap, the commenters are apparently referring to the fact that section 403(a)(1) (requiring allowance allocations resulting in emissions not exceeding 8.90 million tons of SO_2) and section 405(a)(3) (requiring additional allocations of 50,000 allowances) require EPA to allocate annually, starting in 2010, a total amount of allowances authorizing no more than 8.95 million tons of SO_2 emissions. The commenters' argument about how the CAIR model SO_2 cap and trade program effectively reduces the "title IV cap" appears to be that elimination of the ability to use, in the Acid Rain Program, title IV allowances that will be used for compliance in the CAIR model SO_2 cap and trade program has the effect of reducing the annual 8.95 million ton cap on SO_2 emissions. This effective reduction of the "title IV cap" seems to occur when title IV allowances are used in the CAIR SO_2 trading program with a reduced tonnage authorization so that more title IV allowances are deducted per ton of emissions than would be deducted for compliance with the Acid

essentially adopted the Senate's approach and allows the United States—either through Congressional or administrative (*i.e.*, EPA) action—to terminate or limit the allowance authorization. *See Legis. Hist. of CAAA,* Vol. I at 754, 1034, and 1084 (Oct. 27, 2000 floor statements of Sen. Symms, Sen. Baucus, and Sen. McClure indicating EPA has authority to take such action); *but see* Cong. Rec. at E 3672 (Nov. 1, 2000)(extension of remarks of Cong. Oxley indicating that only Congress has such authority).

[138] As discussed below, today's action revises the Acid Rain Program regulations to provide for source-based, instead of unit-based, compliance with the allowance-holding requirement. These revisions are adopted for reasons independent of the adoption of the CAIR model SO_2 cap and trade program, as well as to facilitate the coordination of these two SO_2 trading programs.

[139] The commenters' assertion that the sources in a State that does not participate in the CAIR SO_2 cap and trade program will be cut off from the Acid Rain cap and trade program is incorrect on its face. Such a source will continue to be subject to the allowance-holding requirement and the compliance process in § 73.35 and will not be subject to the allowance-holding requirement and the compliance process in the CAIR model SO_2 cap and trade rule.

[140] The commenters also seem to argue that the allowance definition itself bars EPA from requiring use of Acid Rain allowances in the CAIR SO_2 trading program even on a one-allowance-per-ton-of-emissions basis. However, as noted above, the definition is silent on whether title IV allowances may or may not be used outside the Acid Rain Program.

NMED Exhibit 7f

Rain Program.[141] The commenters claim that such a reduction in the 8.95 million ton cap is contrary to title IV.

In asserting an overarching principle that EPA is barred from adopting any requirement that would have the effect of reducing the 8.95 million ton cap under title IV, the commenters do not point to any specific statutory provision in support. The EPA maintains that not only are there no such supporting provisions, but also certain title IV provisions contradict this purported principle. Specifically, while sections 403 and 405 require annual allowance allocations authorizing no more than 8.95 million tons of emissions, section 403(f) provides, as noted above, that EPA may terminate or limit the one-allowance-per-ton-of-emissions authorization for a title IV allowance.[142] Because any termination or limitation of the tonnage authorization provided by a title IV allowance for purposes of the Acid Rain Program would have the effect of reducing the total tonnage of emissions allowed by the allowance allocations (i.e., the 8.95 million ton cap) under sections 403 and 405, the commenters' claim that EPA is barred from adopting any provision that has such an effect is wrong on its face.

Commenters' Argument Based on Clean Air Markets Group Case

The commenters also state that the CAIR model SO_2 cap and trade program is unlawful under the court's holding in *Clean Air Markets Group* v. Pataki, 338 F.3d 82 (2d Cir. 2003). According to the commenters, the required use of title IV allowances in the CAIR SO_2 program constitutes an unlawful interference with the operation of the interstate title IV SO_2 trading program, presumably similar to the unlawful interference found by the court in *Clean Air Markets Group*. However, the commenters provide little explanation of how such use of title IV allowances (with or without a reduced tonnage authorization) purportedly interferes with interstate operation of the Acid Rain Program and how the holding in *Clean Air Markets Group* applies to the CAIR SO_2 program.

In *Clean Air Markets Group,* the Court reviewed a State law that imposed a monetary assessment on any title IV allowance sold by a New York utility to a utility in any of 14 specified States or subsequently transferred to such a utility, with the assessment equaling the proceeds received in the allowance sale. The law also required that each allowance sold include a covenant barring subsequent transfer of the allowance to a utility in any of those States. The Court held that the State law was pre-empted by title IV because the State law impermissibly interfered with the method chosen by Congress in title IV to reduce utilities' SO_2 emissions, *i.e.*, the opportunity for nationwide trading of title IV allowances. *Id.* at 87–88. In particular, the Court found that the assessment of 100 percent of sale proceeds ''effectively bans'' sales of any allowance by New York utilities to utilities in the specified States and that the restrictive covenant ''indisputedly decreases'' the value of the allowances. *Id.* at 88.

The EPA maintains that today's action is distinguishable from the facts and holding in *Clean Air Markets Group*. In particular, EPA believes that the exercise of its explicit authority under section 403(f) to limit the tonnage authorization of a title IV allowance in the CAIR SO_2 cap and trade program and to terminate the tonnage authorization in the Acid Rain Program once the allowance is used in the CAIR SO_2 program is consistent with—and necessary to preserve—the operation of the Acid Rain Program. Therefore, EPA concludes that its approach of limiting and terminating of the tonnage authorization of title IV allowances does not impermissibly interfere with the interstate operation of the Acid Rain Program and is reasonable.

Unlike the circumstances in *Clean Air Markets Group,* under EPA's approach in today's action, each title IV allowance is freely transferable nationwide unless and until a source uses the allowance to meet the allowance-holding requirements of the CAIR SO_2 program, at which time the allowance is deducted from the source's allowance tracking system account and retired for purposes of both the CAIR SO_2 program and the Acid Rain Program. Further, EPA expects that the ability to use title IV allowances to meet the more stringent emission limitation under the CAIR SO_2 program to maintain or increase (not decrease) the value of each title IV allowance, until the allowance is used to meet the CAIR SO_2 program allowance-holding requirement and is retired.

Of course, this retirement of title IV allowances once they are used to meet the CAIR allowance-holding requirement means that they cannot thereafter be transferred to any person or be used again, *e.g.*, to meet the Acid Rain Program allowance-holding requirement. As noted by the Court in *Clean Air Markets Group,* section 403(b) provides that title IV allowances ''may be transferred among designated representatives of owners or operators of affected sources under [title IV] and any other person who holds such allowances, as provided by the allowance system regulations'' promulgated by EPA.[143] 42 U.S.C. 7651b(b). Moreover, section 403(d)(1) requires that the allowance system regulations ''specify all necessary procedures and requirements for an orderly and competitive functioning of the allowance system.'' 42 U.S.C. 7651b(d). In the context of these statutory requirements, EPA maintains that, on balance, the retirement of title IV allowances used for compliance in the CAIR model SO_2 cap and trade program does not constitute impermissible interference with the interstate operation of the Acid Rain Program, but rather is consistent with, and necessary to preserve, the operation of the Acid Rain Program.

As noted above, the imposition of an SO_2 emission limitation (such as in today's action) that is significantly more stringent than the one under title IV and covers most of the sources and emissions covered by title IV—but without addressing the impact on the Acid Rain Program—would likely have several adverse consequences. These adverse consequences would be: A significant excess of title IV allowances; a collapse of the price of title IV allowances; disruption of the title IV allowance market and the title IV SO_2 cap and trade system; and potential SO_2 emission increases, particularly in States outside the CAIR SO_2 region. The EPA modeling indicates that, in 2010, EGU SO_2 emissions in States not affected by the CAIR SO_2 program would increase by about 260,000 tons (or about 29 percent of the approximately 0.9 million tons of SO_2 emissions projected for the non-CAIR SO_2 region in 2010) in the absence of an approach for addressing the impact of the CAIR SO_2 program on title IV. This

[141] Similarly, to the extent title IV allowances are used in the CAIR SO_2 trading program by non-Acid Rain sources, the ''title IV cap'' seems to be effectively reduced because more allowances are used in the CAIR SO_2 trading program and effectively removed from use in the Acid Rain Program.

[142] In light of this provision, the statement in the NPR (particularly as it is interpreted by the commenters) that EPA lacks authority to tighten the requirements of title IV (69 FR 4618, col. 1) is overly broad and is not repeated or adopted in today's preamble.

[143] While section 403(b) (as well as section 403(d)) refer specifically to the allowance system regulations required to be promulgated by the EPA Administrator within 18 months of November 15, 1990 (the enactment date of the CAA), the EPA Administrator has authority under section 301 to amend such regulations ''as necessary to carry out his functions under [the CAA].'' 42 U.S.C. 7601.

NMED Exhibit 7f

is because, with the imposition of the more stringent CAIR SO_2 emission limitation in the CAIR SO_2 region, this more stringent limitation becomes the binding limitation for sources in that region. These CAIR SO_2 sources must comply with, and cannot use title IV allowances to exceed, the CAIR SO_2 emission limitation. Consequently, the portion of the title IV allowances that equals the difference between the CAIR and the title IV emission limitations is excess and would be available for use only by Acid Rain sources that are outside the CAIR SO_2 region.

This excess amount of title IV allowances is potentially very significant. Today's action requires that the States in the CAIR SO_2 region achieve an amount of SO_2 emission reductions in 2010 and 2015 equal to 50 percent and 65 percent, respectively, of the amount of title IV allowances (about 7.3 million allowances out of the total nationwide allocation of 8.95 million allowances) allocated to the units in the CAIR SO_2 region. If the States achieve all the required CAIR SO_2 reductions through emission reductions by EGUs (which are largely the same units that are subject to the Acid Rain Program) and if EGUs held only one title IV allowance for each ton of SO_2 emissions as required in the Acid Rain Program, the amount of surplus allowances allocated to the States in the CAIR SO_2 region would be about 3.65 million allowances and 4.75 million allowances, respectively in 2010 and 2015.[144] Moreover, the vast majority of EGUs nationwide (about 90 percent) and of EGU SO_2 emissions nationwide (about 90 percent) are covered by the CAIR SO_2 program. The net result would be a large surplus of title IV allowances that would not be usable in the CAIR SO_2 region and would be usable only by the small subset of EGUs (about 10 percent) located in non-CAIR SO_2 region States. Looking at the nation as a whole (both CAIR and non-CAIR SO_2 States) in 2010, there would be total allocations in the Acid Rain Program of 8.95 million title IV allowances but, according to EPA modeling and analysis of the CAIR without a requirement to retire surplus title IV allowances, total projected SO_2 emissions for EGUs of only about 4.8 million tons.[145] Based on the principles of supply and demand, EPA concludes that, with the amount of allowances allocated nation wide exceeding SO_2 emissions for EGUs nationwide in 2010 by about 86 percent (*i.e.*, 8.95 million allowances minus 4.8 million tons divided by 4.8 million tons), the value of title IV allowances would fall to zero, and all but 260,000 of the surplus allowances would have no market and so, as a practical matter, would not be transferable.

The EPA notes that this effect on allowances would occur no matter how the State implements the more stringent SO_2 emission limitation required under the CAIR, *e.g.*, whether implementation is through a new cap and trade program (like in the model rule) or through a fixed (command and control) tonnage emission limit imposed on each individual source. Consequently, the alternatives faced by EPA are either: (1) To establish a CAIR model cap and trade program (or allow States to use another means of achieving CAIR SO_2 emissions reductions) that does not retire the 3.65 million surplus allowances and that results in the devaluation of all title IV allowances to zero and the effective non-transferability of all but 260,000 of the 3.65 million surplus allowances in 2010; or, as provided in today's action, (2) to adopt a CAIR SO_2 model cap and trade program (or another means of achieving reductions) that retires the 3.65 million surplus allowances and that results in the non-transferability of the entire 3.65 million surplus of title IV allowances and ensures the remaining, unused title IV allowances have market value. Thus, with regard to the impact on the transferability of title IV allowances, EPA's decision to adopt the second alternative of retiring the surplus allowances adversely affects the transferability of only a relatively small amount (260,000 out of 8.95 million per year) of allowances, as compared to the amount of allowances whose transferability would be adversely affected under the first alternative.

Moreover, with the total collapse of the title IV allowance price in the Acid Rain Program, the nationwide cap and trade system under title IV—which would be the binding cap and trade system only for sources in the States outside the CAIR SO_2 region—would lose all efficacy. The title IV cap and trade system operates by: Making owners of sources pay for the authorization to emit SO_2 by surrendering, to EPA, allowances that have a market value; and by allowing owners (*e.g.*, those who choose to reduce emissions) to sell unused allowances. Whether the sources' allowances were originally allocated to the sources or were purchased, the owners must decide the extent to which it is more efficient to give up the market value of such allowances or to reduce emissions. If title IV allowances were to have no market value, the title IV cap and trade system would no longer affect the choice of whether to emit or to reduce emissions.[146]

The EPA maintains that such a result is contrary to Congressional intent. The purposes of title IV include not only reductions of annual SO_2 emissions from 1980 levels, but also the encouragement of ''energy conservation, use of renewable and clean alternative technologies, and pollution prevention as a long-range strategy, consistent with the provisions of this title, for reducing air pollution and other adverse impacts of energy production and use.'' 42 U.S.C. 7651(b). Reflecting these purposes, Congress required EPA to promulgate allowance system regulations for the Acid Rain Program that would promote ''an orderly and competitive functioning of the allowance system.'' 42 U.S.C. 7651b(d)(1). *See* Sen. Rep. No. 101–228, 101st Cong., 1st Sess. at 320 (explaining that ''the allowance system is intended to maximize the economic efficiency of the program both to minimize costs and to create incentives for aggressive and innovative efforts to control pollution''). As discussed above, if title IV allowances were to have no market value, the cap and trade system under title IV would no longer affect owners' decisions on whether to emit or to control emissions and so would no longer provide encouragement (*e.g.*,

[144] The surpluses for 2010 and 2015 respectively are calculated as: 7.3 million allowances minus ((100 percent minus the percentage reduction requirement for the year) times 7.3 million allowances).

[145] The 4.8 million ton figure is the sum of: 3.65 million tons of emissions (equal to the tonnage equivalent of the allowance allocations in the CAIR SO_2 region); plus about 0.9 million tons of emissions in the non-CAIR SO_2 region with the retirement of surplus title IV allowances; plus 260,000 tons of increased non-CAIR SO_2 region emissions if the surplus title IV allowances are not retired.

[146] *See* Sen. Rep. No. 101–228, 101st Cong., 1st Sess. at 324 (Dec. 20, 1989) (stating that ''[a]llowances are intended to function like a currency that is sufficiently valuable to stimulate efforts to acquire it through innovative and aggressive efforts to reduce emissions more than required'' and that, in the event of ''inflation in the currency,'' the incentives to ''reduce pollution * * * will be seriously weakened.'' In the instant case, without a requirement to retire excess title IV allowances, the currency would be inflated to a value of zero. *See also Legis. Hist. of CAAA*, Vol. I at 1033 (Oct. 27, 1990 floor statement of Sen. Baucus explaining that ''[s]ince units can gain cash revenues from the sale of allowances they do not use, they will have a financial incentive both to make greater-than-required reductions and/or reductions earlier than required'' and that ''incentives created by the allowance market should stimulate innovations in the technologies and strategies used to reduce emissions'' including energy efficiency).

NMED Exhibit 7f

incentives for innovation) for avoidance or reduction of SO_2 emissions.[147]

In addition, EPA is concerned that such disruption of the title IV allowance market and the title IV SO_2 cap and trade system would significantly erode confidence in cap and trade programs in general and the CAIR model cap and trade programs in particular. As noted above, under the Acid Rain Program, companies have made billions of dollars of investments in emission controls in order to be able to sell excess title IV allowances and in purchasing title IV allowances for future compliance (*e.g.*, under annual, 1-day allowance auctions held by EPA, one as recently as March 22, 2004 when title IV allowances were purchased for about $50 million). While in a market-based program like the Acid Rain Program, investments are necessarily subject to the vagaries of the market, EPA believes that it should try, to the extent possible consistent with statutory requirements, to avoid taking administrative actions that would cause such extensive disruption of the Acid Rain Program. Allowing such disruption to occur could significantly reduce the willingness of owners of sources in new cap and trade programs to invest in measures that would result in excess allowances for sale or to purchase allowances for compliance. To the extent owners would ignore the allowance-trading option and simply control emissions to the level equal to their source's allocations, this would obviate the incentives for innovation, and hamper realization of the potential for cost savings, that would otherwise be provided by new cap and trade programs (such as the CAIR model cap and trade programs).

Finally, as noted above, such disruption of the Acid Rain Program would potentially result in significantly increased SO_2 emissions (about 29 percent in 2010) in States covered by the Acid Rain Program but outside the CAIR SO_2 region.[148] This would have the effect of reversing, at least in part, the beneficial effect that the Acid Rain Program has had on SO_2 emissions in those States, even though the overall goal of nationwide SO_2 emissions reductions would still be met. *See* 42 U.S.C. (a)(1) (Congressional finding that ''the presence of acidic compounds and their precursors in the atmosphere and in deposition from the atmosphere represents a threat to natural resources, ecosystems, materials, visibility, and public health'').

In light of these considerations,[149] EPA concludes, on balance, that structuring the CAIR model SO_2 cap and trade program in a way that avoids such extensive disruption of the Acid Rain Program (*i.e.*, by requiring retirement from the Acid Rain Program of title IV allowances used for compliance in the CAIR SO_2 program) does not constitute impermissible interference with the interstate operation of the Acid Rain Program. Rather, this approach in the model SO_2 cap and trade rule is consistent with, and preserves, such operation—while providing States a tool for imposing the more stringent SO_2 emission limitations required under title I—and is a reasonable exercise of EPA's authority under section 403(f) to terminate or limit the tonnage authorization of title IV allowances.

2. Legal Authority for Requiring Retirement of Excess Title IV Allowances if State Does Not Use CAIR Model SO_2 Cap and Trade Program

As discussed above, a State has the additional options of achieving the SO_2 emissions reductions required by today's actions through: EGU emission reductions only but without using the model SO_2 cap and trade rule; some EGU and some non-EGU emissions reductions; or non-EGU reductions only. The requirement to retire excess title IV allowances applies only in the first and second of these three additional options. The State must retire an amount of title IV allowances equal to the total amount of title IV allowances allocated to units in the State minus the amount of allowances equivalent to the tonnage cap set by the State on EGUs' SO_2 emissions and can choose what mechanism to use to achieve such retirement. The EPA has the authority to require that the State include in its SIP a mechanism for retiring the excess title IV allowances that will result under these two options.

As discussed above, EPA has the authority under section 403(f) to terminate or limit the authorization to emit otherwise provided by a title IV allowance. Specifically, EPA has the authority to: require that any EGU SO_2 emission reduction program, chosen by a State to meet (in full or in part) the requirements of section 110(a)(2)(D), include provisions for retiring excess title IV allowances resulting from the implementation of the more stringent emission reduction requirement under the State program; and to require that such retired title IV allowances cannot be used in the Acid Rain Program. As discussed above, the commenters' claims that such a retirement requirement is barred by title IV (relying on, *e.g.*, the section 402(3) definition of ''allowance'' and on the ''title IV cap'') lack merit. Also, for the reasons discussed above, the retirement requirement is not unlawful under *Clean Air Markets Group* and is a reasonable exercise of EPA's authority under section 403(f) to terminate or limit the tonnage authorization of title IV allowances.

Some commenters also claim that the retirement requirement unlawfully constrains the States' authority to determine in the first instance the control measures to use in meeting emission reduction requirements necessary to comply with section 110(a)(2)(D). According to the commenters, since only EGUs are subject to title IV, the requirement to retire title IV allowances is in effect a mandate that the State control EGU emissions.

However, EPA is imposing the requirement for a State mechanism to retire title IV allowances only if the State decides in the first instance to require any EGU SO_2 emissions reductions to meet the emission reduction requirements under today's action. A State that decides not to require any EGU SO_2 emissions reductions for this purpose is not required to retire title IV allowances. Further, the amount of the required allowance retirement is limited to the amount of EGU SO_2 emissions reductions that the State decides in the first instance to require from EGUs (*i.e.*, the total title IV allowance allocations in the State minus the tonnage amount of the cap set by the State for EGUs' SO_2 emissions). In short, the allowance retirement requirement echoes the State's decision in the first instance concerning the amount of SO_2 emissions reductions to require from EGUs in the State. The EPA simply requires the State to implement the State's EGU–SO_2-emission-reduction-requirement decision in a manner that avoids the otherwise likely, extreme disruption of the title IV SO_2 cap and trade system that is described above. Further, the

[147] While the title IV cap and trade system could be replaced by a new CAIR SO_2 cap and trade system that did not address the problems caused by surplus title IV allowance, that new cap and trade system would not be nationwide like the title IV cap and trade system and so would not cover sources outside the CAIR SO_2 region.

[148] The EPA notes that the potential for increased emissions *within* the CAIR SO_2 region would occur before the implementation of the CAIR SO_2 program and is addressed by allowing pre-2010 banked title IV allowances to be used to meet the CAIR allowance holding requirement beginning in 2010.

[149] While the potential for increased emissions outside the CAIR SO_2 region supports EPA's conclusion, EPA maintains that, even in the absence of any such increase, the other considerations discussed above are sufficient to justify the conclusion that the retirement of title IV allowances does not impermissibly interfere with the Acid Rain Program and is reasonable.

NMED Exhibit 7f

State may choose what mechanism to include in its SIP revision for achieving the required allowance retirement, and EPA will review the effectiveness of the mechanism in achieving such retirement, and approve and adopt the mechanism if appropriate, in an EPA rulemaking concerning the SIP revision. Therefore, EPA concludes that the allowance-retirement requirement is lawful and is a reasonable condition for EPA approval of those State SIPs that require EGU SO_2 emission reductions without using the CAIR model SO_2 trading program.

The EPA notes that the requirement to retire excess title IV allowances—where a State adopts the CAIR model SO_2 trading program or where a State SIP obtains EGU emissions reductions through some other means—is reflected in provisions in both the proposed rules in the SNPR (*i.e.*, in proposed §§ 51.124(p) and 96.254(b)) and in the final rules adopted by today's action (*i.e.*, in final §§ 51.124(p) and 96.254(b)). In reviewing the proposed rules in light of the comments received, EPA has concluded that, for consistency and clarity, the Acid Rain Program regulations should also reference this same retirement requirement. Consequently, today's action adds a new paragraph (a)(3) to § 73.35 of the Acid Rain Program regulations that reiterates the requirement—addressed in the preamble and regulations in both the SNPR and today's action—that title IV allowances previously used to meet the allowance-holding requirement in the CAIR model trading program in § 96.254(b) or otherwise retired in accordance with § 51.124(p) cannot be used to meet the allowance-holding requirement in the Acid Rain Program. Additional revisions of the Acid Rain Program regulations are discussed below.

3. Revisions to Acid Rain Regulations

In the SNPR, EPA proposed to revise the Acid Rain Program regulations, effective July 1, 2005, to implement the allowance-holding requirement on a source-by-source, rather than on a unit-by-unit, basis. Instead of requiring each unit to hold an amount of allowances in its Allowance Tracking System account (as of the allowance transfer deadline) at least equal to the tonnage of SO_2 emissions for the unit in the preceding calendar year, the proposal required each source to hold an amount of allowances in its Allowance Tracking System account at least equal to the tonnage of SO_2 emissions for all affected units at the source for such calendar year. Because language reflecting or referencing the unit-by-unit compliance approach is included in many provisions of the Acid Rain Program regulations, a significant number of proposed rule revisions were necessary to implement source-by-source allowance holding.

In today's final rule, EPA is adopting, with minor modifications, the proposed rule revisions implementing source-by-source compliance with the allowance-holding requirement. As explained in detail in the SNPR (69 FR 32698–32701), EPA finds that: Title IV is ambiguous with regard to whether unit-by-unit compliance is required and so EPA has discretion in this matter; it is important to provide additional compliance flexibility by allowing a unit at a source to use allowances from any other unit at the same source; and many other, non-allowance-holding provisions of title IV evidence a unit-by-unit orientation. Further, as discussed in the SNPR, EPA concludes that the adoption of source-level compliance reasonably balances these considerations. In balancing these considerations, EPA also concludes that company-level compliance is not appropriate because it represents too much of a deviation from the unit-by-unit orientation in the non-allowance-holding provisions of title IV and is likely to require much more dramatic changes in the operation of the Acid Rain Program. *See* 69 FR 32699–700. It is important to note that the final rule revisions, like the proposed revisions, change only the allowance-holding requirement and not the emissions monitoring and reporting requirements, which continue to be applied unit by unit.

In today's action, EPA is making the source-level-compliance rule revisions effective July 1, 2006, which is 1 year later than proposed. The shift from unit-level to source-level compliance will require software changes and testing to ensure that the Allowance Tracking System operates properly. Currently, EPA is in the process of conducting a general review and re-engineering of the Allowance Tracking System and Emissions Tracking System and anticipates completing the process in 2006. The process of shifting the Allowance Tracking System to source-level compliance will be much more efficient and less likely to have adverse results on the system if the shift is coordinated with the general review and re-engineering and therefore implemented starting July 1, 2006. Further, as discussed below, this delay of implementation for 1 additional year will give owners additional time to make changes that they determine are necessary in order to adapt to source-level compliance.

Some commenters support the shift to source-by-source allowance holding, and some oppose the change. One commenter opposing the change claims that a source-by-source allowance-holding requirement is ''contrary to market-based principles.'' According to the commenter, market-based systems give operators the tools for achieving compliance through allowance transfers, but with source-level compliance the operators do not have to take any action to maintain sufficient allowances because EPA will move the allowances around for them.

The commenter's argument is based on an incorrect premise. Whether compliance is unit-by-unit or source-by-source, the owner or owners of the affected units at each source must take the same types of actions in order to comply with the applicable allowance-holding requirement. In particular, under source-level compliance, such owner or owners must reduce emissions, retain allowances allocated to such units, obtain additional allowances, or take a combination of these actions to ensure that the Allowance Tracking System account for the source holds enough allowances to cover the total emissions of the affected units at the source. The owner or owners also have the option of reducing emissions below allocations so that there are extra allowances available to hold for future use or sale. If the owner or owners do not have enough allowances to cover the emissions from the source, EPA will not move, on its own initiative, allowances into the source's compliance account from other sources' accounts or from general accounts, even if there are extra allowances in the other accounts. The only difference between the types of actions owners must take under the unit-level and source-level approaches is that, under unit-level compliance, the owners must transfer allowances from one unit at a source to a second unit at that source in order to use the first unit's allowances for compliance by the second unit while, under source-level compliance, any allowance held for compliance for the first unit can be used—without a transfer—for compliance by the second unit. This difference is reflected in the Allowance Tracking System, which, under the unit-level approach, includes a separate account for each unit and, under the source-level approach, includes a single account for all the affected units at a single source.

In summary, the mechanism, and the owners' responsibilities, for achieving

NMED Exhibit 7f

compliance with the allowance-holding requirements are analogous under unit-by-unit and source-by-source compliance, except that, under source-by-source compliance, allowances need not be transferred among units at the same source. The EPA does not believe that the source-by-source approach is any less market-based than the unit-by-unit approach. Owners will still have the ability to reduce emissions or purchase or sell allowances and the responsibility to take actions (including the holding of extra allowances) to ensure they have enough allowances to cover emissions. Moreover, the market-price of allowances will still play a crucial role in owners' decisions on what actions to take. The EPA's adoption of source-by-source compliance preserves market-based principles, while reasonably balancing of the ambiguity of title IV, the need for additional compliance flexibility, and the unit-by-unit orientation of many provisions in title IV. *See* 69 FR 32699–700.

The commenter also argues that having a source-level allowance-holding requirement in the Acid Rain Program (and the CAIR model cap and trade program) is inconsistent with unit-level compliance in the NO_X SIP Call cap and trade program. However, other than pointing out this difference, the commenter fails to explain why the programs must be identical in this regard. Based on experience with the Acid Rain Program (as well as the NO_X SIP Call trading program), EPA concludes that a source-level allowance-holding requirement will result in a somewhat less complicated program and a reduced likelihood of inadvertent, minor errors, while achieving the program's environmental goals. *See* 69 FR 32699–700.

The commenter suggests that, instead of adopting source-level compliance, EPA revise the Acid Rain Program regulations to allow for source over-draft accounts, like those allowed in the NO_X SIP Call cap and trade program. Under the NO_X SIP Call program, each source may have a source over-draft account, in which may be held extra allowances that may be used for compliance by any affected unit at the source. However, EPA believes that source-level compliance is a better approach than unit-level compliance with over-draft accounts. Relatively few owners in the NO_X SIP Call cap and trade program actually put allowances in over-draft accounts, and achievement of compliance is made more complicated by the ability of all units at a source to draw on the over-draft account (if any allowances are put in it) but the inability of any unit to use extra allowances held instead by another unit at the source. Consequently, rather than adopting in the Acid Rain Program the unit-level approach with over-draft accounts, EPA is today adopting the source-level approach in the Acid Rain Program and may consider in the future, as appropriate, adopting the source-level approach in other programs using unit-level compliance.

One commenter states that EPA should revise the Acid Rain Program regulations to allow owners, each year, the option of choosing whether to use unit-level or source-level compliance. According to the commenter, significant investments have been made to monitor and report emissions and surrender allowances under the existing Acid Rain Program regulations, and shifting to source-level compliance will require substantial resources and time. The commenter also states that unit-based compliance should be retained as an option ''to accommodate joint ownership and other special arrangements that may not affect an entire facility.''

The EPA rejects the suggestion of allowing each owner the option, for each year and for each source, of choosing between unit-level and source-level compliance. Such an approach would significantly complicate the achievement by sources, and the determination by EPA, of compliance. The potential for error (*e.g.*, due to erroneous assumptions about whether unit-or source-level compliance would be applicable to a particular source for a particular year) on the part of owners or EPA would be significantly increased. Moreover, this complicated approach would result in inconsistent treatment from source to source and year-to-year. Further, the commenter provided only vague assertions about the benefits of unit-based compliance in certain circumstances and did not assert—much less show—that source-level compliance cannot be accommodated under those circumstances. The EPA maintains that the only reasonable options for the allowance-holding requirement in the Acid Rain Program are either generally requiring compliance by all sources each year on a unit-level basis (as in the existing regulations) or requiring compliance by all sources each year on a source-level basis (as in the proposed revisions to the regulations). For the reasons discussed above, EPA believes that source-level compliance for the allowance-holding requirement is preferable. By postponing until July 1, 2006 the effective date of the rule revisions shifting to source-level compliance (with the result that 2006 is the first year of source-level compliance), EPA is providing owners a reasonable amount of time to make any necessary adjustments, such as those claimed by the commenter. Further, as noted above, the rule revisions change only the allowance-holding requirement and not the emissions monitoring and reporting requirements. This should limit the scope of adjustments necessary for owners to implement source-level compliance and will preserve the availability of reliable, unit-level emissions data.

Because unit-level compliance is reflected throughout the Acid Rain Program regulations, numerous revisions of the regulations are necessary to implement source-level compliance. (None of these changes are to the emissions monitoring and reporting provisions in part 75 since monitoring and reporting continue to be on a unit basis.) One commenter requested that EPA provide ''more in-depth detail'' on the proposed revisions. However, in the SNPR, EPA described the types of, and reasons for, revisions that are necessary for source-level compliance (69 FR 32700–01) and set forth all of the specific, proposed changes (69 FR 3273–41). Moreover, no commenters stated that they did not understand any specific, proposed revision or the reason for any specific revision. The EPA notes that in reviewing the proposed Acid Rain rule revisions in light of the comments, EPA found some additional references in the Acid Rain rule to unit-level compliance that should be revised to reflect source-level compliance. In today's action, EPA is adopting revisions of these additional references (*e.g.*, changing references to a ''unit's account'' or a ''unit account'' to a source's ''compliance account'') that are analogous to the revisions specifically identified in the SNPR.[150]

Another commenter opposed the rule revisions implementing source-level compliance on several other grounds. The commenter claims, without citing any statutory support, that the Acid Rain Program is based on ''control of emissions at the unit level'' so that, in the event of excess emissions, the ''source as a whole would not be punished'' and ''corrective action could take place'' at the particular unit. According to the commenter, source-level compliance will: Make it harder to determine which unit caused excess emissions; make the existing Acid Rain

[150] This approach is consistent with the SNPR, where EPA proposed to convert all references, including any initially missed in the SNPR, from unit- to source-level compliance (69 FR 32700).

permits meaningless; make the individual unit allowance allocations meaningless; and cause confusion over which units at a source are affected units.

While there are many non-allowance-holding provisions in title IV that have a unit-by-unit orientation, EPA disagrees with the commenter's basic assertion that the purpose of the Acid Rain Program is to control emissions on a unit-by-unit basis and that there is a need to ''distinguish'' the compliance of each individual unit. The provisions concerning application of the allowance-holding requirement are ambiguous as to whether EPA must implement the requirement on a unit-level or a source-level, and the environmental benefits of the Acid Rain Program will still be realized with source-level compliance. *See* 69 FR 32699–700. Further, while EPA will determine compliance on a source-by-source basis, nothing in the regulations prevents owners (*e.g.*, owners of units at sources with multiple units and multiple owners or owners of units with multiple owners and exhausting through a common stack) from determining by agreement which owners will bear any excess emissions penalties that occur at the plant and have to take correction actions. Indeed, owners are likely to already have these types of agreements in cases of units or sources with multiple owners. This is because the Acid Rain Program regulations already allow a unit at a multi-unit source to use some allowances from other units at the source (albeit to cover most but not all of the potential excess emissions) and already allow one unit exhausting from a common stack to use allowances from another unit at that stack (without any limitation on such use). *See* 40 CFR 73.35(b)(3) and (e). In addition, while the Acid Rain permits will have to be revised in the future to reflect source-level compliance, today's rule does not make source-level compliance effective until 2006. Permits will not have to be revised until around the end of 2006, which should provide States a reasonable opportunity to amend the permits. Contrary to the claims of the commenter, source-level compliance does not make the unit-by-unit allocations meaningless; the unit-by-unit allocations (set forth in Table 2 of § 72.10) will determine the amount of allocations reflected in each Allowance Tracking System source account, which amount will equal the sum of the allocations for all affected units at the source. Finally, the commenter failed to explain how the source-level allowance-holding requirement could cause ''confusion'' over which units are affected units. This source-level requirement does not change the applicability provisions, which are still applied unit by unit.

As discussed in the SNPR, EPA proposed—in addition to the rule revisions to implement source-level compliance—other revisions of the Acid Rain Program regulations in order to facilitate coordination of the Acid Rain Program and the CAIR SO_2 cap and trade program. These additional revisions were described and explained in the SNPR (69 FR 32701). The EPA is adopting these revisions for the reasons in the SNPR, as amplified below. Most of these revisions are supported, or not opposed, by commenters, but some commenters objected to certain revisions.

For example, EPA noted that it had recently changed the ''cogeneration unit'' definition in § 72.2 in June 2002 (67 FR 40394, 40420; June 12, 2002). The original definition in § 72.2 had been used since the commencement of the Acid Rain Program. The only significant difference between the original and revised definitions is that the former refers to a unit ''having the equipment used to produce'' electricity and useful thermal energy through sequential use of energy, while the latter simply refers to a unit ''that produces'' electricity and useful thermal energy in that manner. The reason that EPA gave for revising the definition in June 2002 was to conform with the definition in the Section 126 rule. However, the Section 126 rule (and the NO_X SIP Call) did not actually specify a ''cogeneration unit'' definition. Consequently, there is no reason to use the June 2002 revised definition. Moreover, EPA is concerned that the change in the definition of ''cogeneration unit'' as of June 2002 may cause confusion or raise question about what units qualify for exemptions for ''cogeneration units'' from the Acid Rain Program. Under these circumstances, EPA concludes that the definition should be changed back to the original definition in § 72.2 and, in any event, intends to interpret the June 2002 revised definition as having the same meaning as the original definition. One commenter raised concerns that EPA did not provide any ''detailed analysis'' of the implications of changing the ''cogeneration unit'' definition. However, as discussed above, the change simply reinstates the definition that had been used in the Acid Rain Program from the initial promulgation of implementing regulations in 1993 until 2002. No commenter asserted that reverting to the longstanding, original definition would be disruptive.

Another Acid Rain Program rule revision proposed in the SNPR is the elimination of the requirement for owners and operators to submit an annual compliance certification report for each source. One commenter expressed concern, because the purpose of the annual certification is to ensure that the designated representative is ''aware and has assured the quality of the data'' being submitted to EPA. However, as noted in the SNPR, designated representatives must evidence such awareness and compliance by submitting, with each quarterly emissions report, a certification that the monitoring and reporting requirements under part 75 of the Acid Rain Program regulations have been met. *See* 40 CFR 75.64(c). Quarterly emissions reports are available on-line to the public and the States. In addition, owners and operators of sources subject to the Acid Rain Program must submit, under title V of the CAA, annual compliance certification reports concerning all CAA requirements (including Acid Rain Program requirements). Under these circumstances, EPA maintains that the separate Acid Rain Program annual compliance certification reports are duplicative and unnecessary. The EPA notes that it appears that few, if any, requests for copies of these Acid Rain Program reports have been made by States or any other persons since the commencement of the Acid Rain Program. Apparently, other certifications and submissions required of owners and operators have been sufficient for the purposes cited by the commenter.

The SNPR also included proposed revisions eliminating the requirement under the Acid Rain Program for a 1-day newspaper notice for designation of designated representatives and authorized account representatives. One commenter suggests that this notice should be replaced by a requirement to notify the State permitting authority. The EPA notes that information on designated representatives and authorized account representatives is already available to State permitting authorities through on-line access to the Allowance Tracking System. Moreover, EPA is in the process of developing, and anticipates establishing in the near future, the ability to send State permitting authorities (at their request) on-line notices of changes in designated representatives (who are also the authorized account representatives for affected sources' accounts).

NMED Exhibit 7f

Other proposed Acid Rain Program rule revisions on which EPA received adverse comment are the removal of § 73.32 (prescribing the contents of an allowance account) and § 73.51 (prohibiting the transfer of allowances from a future year subaccount to a subaccount for an earlier year). Section 73.32 sets forth a rather self-evident list of information that must be recorded in an allowance account in the Allowance Tracking System, such as the name of the authorized account representative, the persons represented by the authorized account representative, and the transfers of allowances in and out of the account. This section also references information on compliance or current year subaccounts and future year subaccounts, as well as emissions information. As discussed in the SNPR, several items on the list of informational contents for allowance accounts are out-of-date in that they do not reflect how the electronic Allowance Tracking System operates or will operate in the near future. For example, the electronic Allowance Tracking System does not currently use or refer to subaccounts, which will continue to be unnecessary in the context of source-level compliance.[151] *See* 69 FR 32700–01. In addition, while § 73.32 states that emissions data are reflected in the Allowance Tracking System account, such data are currently available instead through the electronic Emissions Tracking System. Because the information list in § 73.32 contains either self-evident items or items that are out-of-date and because the NO_X Allowance Tracking System has been operating successfully even though the model NO_X Budget cap and trade rule and State cap and trade rules under the NO_X SIP Call lack a provision analogous to § 73.32, EPA is removing § 73.32. EPA notes that the removal of the section will not mean that the information contained in allowance accounts ''can be changed at will.'' The format for allowance accounts is set forth in the electronic Allowance Tracking System and implements the requirements in the Acid Rain Program regulations concerning the holding, transferring, recording, and deducting of allowances.

Section 73.51 prohibits the transfer of allowances from a future year subaccount to a subaccount for an earlier year. The removal of this section is consistent with the elimination throughout the rest of the Acid Rain Program regulations, as discussed in the SNPR (*id.*), of any references to such subaccounts. Further, the prohibition on using allowances allocated for a year to meet the allowance-holding requirement for a prior year is retained in other provisions of the Acid Rain Program regulations. Consequently, EPA is removing § 73.51.

C. How Does the Rule Interact With the Regional Haze Program?

This section discusses the relationship of the CAIR cap and trade program for EGUs with the regional haze program under sections 169A and 169B of the CAA, in particular the requirements for Best Available Retrofit Technology (BART) for certain source categories including EGUs. The legislative and regulatory background of the BART provisions were presented in some detail in the SNPR. (See 69 FR 32684, 32702–704, June 10, 2004). In brief, BART regulations consist of two components. The first, promulgated in 1980, addresses visibility impairment that can be ''reasonably attributed'' to a single source or small group of sources. (45 FR 80085; December 2, 1980, codified at 40 CFR 51.302). The second component addresses BART in relation to regional haze (visibility impairment caused by a multitude of broadly distributed sources) and was promulgated as part of the Regional Haze Rule. (64 FR 35714; July 1, 1999). Certain parts of the BART provisions in that rule were vacated by the U.S. Court of Appeals for the DC Circuit in *American Corn Growers et al.* v. *EPA,* 291 F.3d 1 (DC Cir., 2002). To address that decision, in May 2004, EPA proposed changes to the Regional Haze Rule and reproposed the Guidelines for BART Determinations (originally proposed in 2001) (69 FR 25185, May 5, 2004).

On February 18, 2005, the DC Circuit decided another case dealing with BART and a BART alternative program, *Center for Energy and Economic Development* v. *EPA*, No. 03–1222, (DC Cir. Feb. 18, 2005) (''*CEED*''). In this case, the court granted a petition challenging provisions of the regional haze rule governing the optional emissions trading program for certain western States and Tribes (the ''WRAP Annex Rule''). The holdings of the case are relevant to today's action in several respects.

Most importantly for purposes of the CAIR, *CEED* affirmed EPA's interpretation of CAA 169A(b)(2) as allowing for non-BART alternatives where those alternatives make greater progress than BART. (*CEED*, slip. op. at 13) (finding that EPA's interpretation of CAA 169(a)(2) as requiring BART only as necessary to make reasonable progress passes the two-pronged Chevron test).

The particular provisions involved in *CEED* applied, on an optional basis, only to nine western States[152] (none of which are in the CAIR region) and the Tribes therein. The provisions, contained in 40 CFR 51.309 (''section 309'') required among other things that States choosing to participate in a ''backstop''[153] cap and trade program must demonstrate that the emissions reductions under the program resulted in greater progress towards the national visibility goals than would BART. At issue was the particular methodology required for this demonstration. Specifically, EPA's rule required that visibility improvements under source-specific BART—the benchmark for comparison to the cap and trade program—must be calculated based on the application of BART controls to all sources subject to BART.[154] Although *American Corn Growers* had vacated this cumulative visibility approach in the context of determining BART for individual sources, EPA believed that it was still permissible to require this methodology in the context of a BART-alternative program. The DC Circuit in *CEED* held otherwise, stating: ''EPA cannot under § 309 require states to exceed invalid emission reductions (or, to put it more exactly, limit them to a § 309 alternative defined by an unlawful methodology).'' (*Id.* at 14).

Thus, *CEED* firmly established two principles: (1) The CAA allows States to substitute other programs for BART where the alternative achieves greater progress, and (2) EPA may not require States to evaluate visibility improvement on a cumulative basis as a condition for approval of a BART-alternative. The first principle validates EPA's proposal to allow the CAIR to substitute for BART. The second

[151] In reviewing the proposed Acid Rain Program rule revisions, EPA found some additional references to ''subaccounts'' that were not specifically noted in the SNPR. For consistency and clarity in the Acid Rain Program rules, EPA is adopting in today's action revisions (*e.g.,* chaning the term ''subaccount'' to ''compliance account'') of these additional references, which revisions are analogous to those specifically set forth in the SNPR. This approach is consistent with the SNPR, where EPA proposed to convert all references, including any initially missed in the SNPR, from subaccount to compliance account, (69 FR 32700).

[152] Arizona, California, Colorado, Oregon, Idaho, Nevada, New Mexico, Utah, and Wyoming.

[153] The trading program is referred to as a ''backstop'' because under the WRAP Annex, States have the opportunity to achieve specified emission milestones using voluntary measures, with the trading program coming into effect only if those milestones are exceeded.

[154] The methodology is prescribed in 40 CFR 51.308(e)(2) and incorporated into § 309 by reference at 40 CFR 51.309(f).

NMED Exhibit 7f

principle is not at issue in the CAIR context, because EPA is not proposing to impose the cumulative visibility methodology upon States, nor to require States to treat the CAIR as having satisfied their BART obligations.

Nonetheless, EPA has determined that it is premature to make a final determination regarding the sufficiency of the CAIR as a BART alternative, primarily because (1) the guidelines for source-specific BART determinations, in response to *American Corn Growers* have not been finalized, and (2) there is now a need to revise the Regional Haze Rule and the guidelines for BART-alternative programs in response to *CEED*. The source-specific BART guidelines will be finalized on or before April 15, 2005, under a consent decree. The rule changes and revisions to the BART-alternative guidelines will be proposed soon thereafter.

Therefore, we are making no final determination in today's action with respect to BART. The EPA continues to believe, however, that the CAIR will result in greater progress in visibility improvement than BART, as explained below.

1. How Does This Rule Relate to Requirements for BART Under the Visibility Provisions of the CAA?

a. Supplemental Notice of Proposed Rulemaking

In the SNPR, we proposed that States which adopt the CAIR cap and trade program for SO_2 and NO_X would be allowed to treat the participation of EGUs in this program as a substitute for the application of BART controls for these pollutants to affected EGUs.[155] To give this option effect, we proposed an amendment to the Regional Haze Rule which would add a section at 40 CFR 51.308(e)(3), as follows:

(3) A State that opts to participate in the Clean Air Interstate Rule cap and trade program under part 96 AAA–EEE need not require affected BART-eligible EGUs to install, operate, and maintain BART. A State that chooses this option may also include provisions for a geographic enhancement to the program to address the requirement under § 51.302(c) related to BART for reasonably attributable impairment from the pollutants covered by the CAIR cap and trade program.

This proposal is consistent with currently existing provisions which allow States to develop cap and trade programs or other alternative measures in lieu of the application of BART on a source specific basis. (*See* 40 CFR 51.308(e)(2) and 64 FR 35714, 35741–35743, July 1, 1999). The proposal was based on the application of the proposed two-pronged test for whether an alternative to BART is ''better than BART'' which was proposed in the 2001 BART guidelines and reproposed without changes in our May, 2004 proposed guidelines for BART determinations (69 FR 25184, May 5, 2004).

Specifically, the re-proposed BART Guidelines provide that if the geographic distribution of emissions reductions is anticipated to be similar under both programs, the trading program (or other alternative measure) must be shown to achieve greater overall emissions reductions than the application of source-specific BART. If the trading program is anticipated to result in a different geographic distribution of emissions reductions than would source-specific BART, the trading program must be shown to result in no decline in visibility at any Class I area, and in an overall improvement in visibility on an average basis over all affected Class I areas (69 FR 25184, 25231). Because we had not yet determined whether there is a difference in the geographic distribution of emissions reductions between the CAIR and the application of source-specific BART in the CAIR region, we assessed the difference between the two programs by evaluating the visibility impacts of each program, using this proposed two-pronged test.

The emissions projections and air quality modeling used to demonstrate that the CAIR satisfies this proposed two-pronged test were presented in a document entitled Supplemental Air Quality Modeling Technical Support Document (TSD) for the Clean Air Interstate Rule (May 4, 2004). In brief, we found that the CAIR would not result in a degradation of visibility from current conditions at any Class I Area nationwide. Within the CAIR-affected States and New England, EPA found that the CAIR would produce greater visibility benefits—specifically, an average improvement of 2.0 deciviews, as compared to 1.0 for BART. The EPA also found that average visibility improvement for Class I areas nationwide would be 0.7 deciviews under the CAIR, compared to 0.4 deciviews under BART. The EPA noted in the SNPR and the TSD that because the emissions scenarios used in these analyses were developed for different purposes, the scenarios varied slightly from the scenarios which would be ideal for this test. The EPA committed to conduct additional analyses, and those analyses have now been done. The new modeling and results are discussed in more detail in section IX.C.2 below.

b. Comments and EPA's Responses

Several commenters argued that a categorical exclusion of sources from BART would violate the CAA, as interpreted by the U.S. Court of Appeals for the DC Circuit in *American Corn Growers* v. *EPA,* 291 F.3d 1, 2002, by illegally constraining the discretion Congress conferred to States in making BART determinations and by depriving States of an adequate opportunity to evaluate the emissions reductions in light of the BART requirement. Some States also expressed a desire to retain their discretion to require BART. Additionally, some commenters asserted that EPA could not offer an exemption to BART unless the conditions for exemptions provided by CAA 169A(c) are met, including a showing that the source in question will not, alone or in combination with other sources, emit any pollutant which may reasonably be anticipated to cause or contribute to impairment at any Class I area, and the concurrence of the appropriate Federal Land Manager with the exemption determination.

The EPA agrees that under the CAA and the *American Corn Growers* case, EPA may not preclude a State from conducting its own BART analysis, nor from requiring BART controls at individual sources as determined appropriate through such analysis. Accordingly, as noted above, the proposed regulatory change to the Regional Haze Rule would provide that a CAIR affected State ''need not require affected BART-eligible EGUs to install, operate, and maintain BART'' if such State opts to participate in the CAIR cap and trade program. The optional nature of this language (''need not'' rather than ''may not'') is consistent with the *American Corn Growers* decision, because it does not attempt to mandate that States must consider the CAIR as having met the requirements of BART.

The SNPR preamble summarized the proposal by stating that ''EPA proposes that BART-eligible EGUs in any State affected by CAIR may be exempted from BART controls for SO_2 and NO_X if that State complies with the CAIR requirements through adoption of the CAIR cap and trade programs for SO_2 and NO_X emissions.'' (69 FR 3270). That statement accurately reflected the optional nature of the better-than-BART substitution policy, by providing that sources ''may'' be granted such regulatory flexibility. However, the use of the term ''exempted'' in this context

[155] The SNPR preamble used the term ''exemption'' in describing this policy. As clarified below, and as consistent with the proposed regulatory language, the better-than-BART policy is not actually an exemption but rather an alternative means of compliance.

NMED Exhibit 7f

was somewhat imprecise. EPA agrees that sources may not be ''exempt'' from BART requirements unless the requirements of 169A(c) are fulfilled. The better-than-BART policy is not an ''exemption'' from BART; it is an alternative regulatory program that would allow Congressionally required emissions reductions from BART-eligible sources to be made in a more cost-effective manner. Moreover, as explained elsewhere in the SNPR and again below, BART-eligible EGUs would not be ''exempt'' from BART because, until the emissions reductions required by the CAIR are fully realized, such sources would remain subject to the possibility of being required to install BART controls if deemed necessary to meet requirements regarding reasonably attributable visibility impairment, as provided by 40 CFR 51.302.

Several commenters asserted that because Congress singled out 26 source categories for the application of BART, there is no basis in law for EPA to ''exempt'' some of these categories. These comments amount to facial challenges of EPA's authority to approve SIPs which contain alternative strategies, rather than source-specific BART requirements, for BART-eligible sources.

The EPA's authority to approve alternative measures to BART, where those measures achieve greater reasonable progress than would BART, was recently upheld by the DC Circuit. (*CEED,* slip. op. at 13). See also Central Arizona *Water Conservation District* v. *EPA,* 990 F.2d 1531, 1543, (1993) (Upholding EPA's interpretation of CAA 169A(b)(2)as providing discretion to adopt implementation plan provisions other than those provided by BART analyses in situations where the agency reasonably concludes that more reasonable progress will thereby be attained).

Similarly, some commenters stated that the CAIR could not substitute for BART because the CAIR and BART are authorized by separate parts of the CAA. They argue that allowing reductions required by a provision of the CAA not linked to visibility improvement to substitute for BART would alter Congress' ''mandate'' that certain source categories make reductions for visibility in excess of what other CAA provisions require of those sources.[156] Commenters also point to Regional Haze Rule section 308(e)(2), as evidence that reductions from other programs such as title IV and the NO_X SIP Call must be achieved in addition to, and not as a substitute for, BART. Commenters also argue that EPA (and States) will need all available tools, including BART, to meet visibility and NAAQS requirements.

Again, under our interpretation of CAA section 169A(b)(2) as upheld in *CEED* and *Central Arizona Water,* Congress did not ''mandate'' that emission reductions from certain source categories be obtained by the installation of BART controls. Instead, the CAA allows for alternative measures to BART—whether for EGUs or non-EGUs—where those measures result in greater reasonable progress, and as explained below, we have determined that greater reasonable progress can be obtained from the EGU sector through the use of the CAIR cap and trade program. However, if a State believes more progress can be made at affected Class I areas by utilizing BART, the State need not make the determination that the CAIR substitutes for BART in that State. Therefore, EPA is not eliminating any tools available to the States.

With respect to Regional Haze Rule section 308(e)(2), EPA does not believe that this section provides any support for the notion that emissions reductions from other programs must necessarily be in addition to, not substitute, for BART. We first note that the decision in CEED necessitates revisions to 308(e)(2), at least in the provisions requiring visibility to be evaluated on a cumulative basis in defining the BART benchmark for comparison to BART alternative programs. It remains to be seen whether 308(e)(2)(iv), which requires that emissions reductions from the BART alternative be ''surplus to reductions resulting from measures adopted to meet requirements as of the baseline date of the SIP,'' will be changed. Even if that section remains unchanged, the CAIR complies with it. The baseline date of Regional Haze SIPs is 2002.[157] Since any emissions reduction requirements to meet the CAIR would necessarily be adopted after 2002, CAIR-required reductions would clearly be surplus to measures adopted as of the baseline year.[158]

Several commenters argued that the question of whether BART is better than the CAIR is properly addressed in the BART rulemaking, not in today's action, and that the better-than-BART determination is otherwise premature. While EPA believes that our current analysis demonstrates that the CAIR is better than BART (based on the criteria in our May 2004 BART proposal), and that the range of uncertainty regarding the presumptive BART controls for EGUs to be finalized in the BART guidelines is not likely to alter that demonstration, we agree that we cannot make a final determination that CAIR is better than BART until the changes to the regional haze regulations required by both *American Corn Growers* and *CEED* are finalized.

Several commenters felt the CAIR should be considered better than BART for a State whether or not that State participates in the CAIR cap and trade program, as long as the State achieves its emission reduction requirement under the CAIR. Conversely, one commenter felt that CAIR reductions should be considered better than BART only when a State does not participate in the cap and trade program, thereby ensuring that the reductions will occur in-State.

Our preliminary demonstration that the CAIR results in more reasonable progress than BART for EGUs is based on a comparison of emissions reductions from EGUs, and attendant air quality effects, under the CAIR as compared to under BART as proposed in May, 2004. If emissions reductions are achieved from other source sectors, a similar analysis would have to be conducted for those sector(s) before it could be determined that the reductions were better than BART for affected source categories. For example, if a State either wants to use EGU emissions reductions under the CAIR to substitute for BART for non-EGUs, or use non-EGU emissions reductions to substitute for BART for EGUs, that could be allowed as an alternative measure to BART provided a similar ''better-than-BART'' determination is made for the sectors involved.

A few commenters believed EPA should not limit the substitution of the CAIR for BART to States that are required to meet CAIR for both SO_2 and NO_X on an annual basis, but rather should also allow it for States which are only required to reduce NO_X during the ozone season. Because the modeling scenarios were based on the pollutants

[156] CAIR is linked to visibility improvements insofar as it attempts to make progress towards attainment of the $PM_{2.5}$ NAAQS, which would, among other things, improve visibility.

[157] See ''2002 Base Year Emission Inventory SIP Planning: 8-hr Ozone, $PM_{2.5}$ and Regional Haze Programs,'' November 8, 2002, Guidance Memorandum, *http://www.epa.gov/ttn/oarpg/t1/memoranda/2002bye_gm.pdf.*

[158] The purpose of providing a cut-off year for SIP measures to which the alternative must be surplus is to prevent an untenable situation where programs being developed simultaneously must be surplus to each other. Establishing a baseline year allows States to continue to make reductions between that baseline date and the submittal of regional haze SIPs without being ''penalized'' for those reductions by not being allowed to count them as contributing to reasonable progress towards the national visibility goal.

NMED Exhibit 7f

covered by the CAIR in each affected State, our better-than-BART demonstration is limited to those scenarios. A State subject to the CAIR for NO_X purposes only would have to make a supplementary demonstration that BART has been satisfied for SO_2, as well as for NO_X on an annual basis.

A few commenters believed that the CAIR should satisfy BART for purposes of reasonably attributable visibility impairment as well as BART for purposes of regional haze. Several others commented that it was appropriate or legally necessary to preserve the authority of Federal Land Managers (FLMs) and States to certify impairment and make reasonable attribution determinations, which could subject a source to BART requirements even if the source is a participant in the CAIR cap and trade program. These commenters supported the use of a strategy similar to that employed by the Western Regional Air Partnership, which relies upon a Memorandum Of Understanding (MOU) between the FLMs and the States regarding the criteria by which certifications of impairment may be made, along with the possibility of ''geographic enhancements'' to the cap and trade program to accommodate the imposition of source-specific BART control requirements on a source within the cap and trade program.

As proposed in the SNPR, EPA continues to believe that reasonably attributable visibility impairment determinations under 40 CFR 51.302 must continue to be a viable option in order to insure against any possibility of hot-spots. We believe that a certification of reasonably attributable visibility impairment is fairly unlikely, given that there have been few such certifications since 1980, and given that the reductions from the CAIR and other recent initiatives will make such certifications decreasingly likely. We believe sources can be given sufficient regulatory certainty to enable effective participation in a cap and trade program through the use of MOUs and geographic enhancement provisions.

Some commenters believe that because section 169A(b)(2)(A) requires BART for an eligible source which may reasonably be anticipated to cause or contribute to any impairment of visibility in any Class I area, EPA is without basis in law or regulation to base a better-than-BART determination on an analysis that does not evaluate visibility improvement at each and every Class I area, or one that uses averaging of visibility improvement across different Class I areas.

The criteria we applied in our present analysis—that greater reasonable progress is defined as no degradation at any Class I area, and greater overall average improvement—have not been finalized. However, we disagree with comments that 169A(b)(2)'s requirement of BART for sources reasonably anticipated to contribute to impairment at any Class I area [159] means that an alternative to the BART program must be shown to create improvement at each and every Class I area. Even if a BART alternative is deemed to satisfy BART for regional haze purposes, based on average overall improvement as opposed to improvement at each and every Class I Area, 169A(b)(2)'s trigger for BART based on impairment at any Class I area remains in effect, because a source may become subject to BART based on ''reasonably attributable visibility impairment'' at any area. (The EPA believes it is unlikely that a State or FLM will have need to certify reasonably attributable visibility impairment (RAVI) with respect to any EGU in the CAIR region, but nevertheless believes it is necessary to preserve this safeguard).

We also received a number of comments regarding the broader relationship between the CAIR and regional haze, including whether the CAIR meets reasonable progress requirements, as well as BART, for affected States; whether EPA should allow non-CAIR States to opt in to the CAIR cap and trade program to meet their BART requirements; and whether regional haze provisions should be used as a basis for expanding the CAIR rule to the rest of the States which were not included on the basis of contribution to $PM_{2.5}$ and ozone nonattainment. The EPA's responses to comments on these broader issues, which are not germane to the issue of whether the CAIR may substitute for BART for affected EGUs, are contained in the Response to Comment Document.

c. Today's Action

As discussed above, EPA has the authority to approve SIPs which rely upon a cap and trade program as an alternative to BART. However, at this time, we are deferring a final determination that, in EPA's view, the CAIR makes greater progress than BART for CAIR-affected States until such time as the BART guidelines for EGUs and the criteria for BART-alternative programs are finalized. At that time, contingent upon supporting analysis and our final rules governing the regional haze program, EPA will make a final determination as to whether the CAIR makes greater progress than BART, and can be relied on as an alternative measure in lieu of BART.

2. What Improvements Did EPA Make to the Bart Versus the CAIR Modeling, and What Are the New Results?

a. Supplemental Notice of Proposed Rulemaking

For the better-than-BART analysis in the SNPR, we used the Integrated Planning Model (IPM) to estimate emissions expected after implementation of a source-specific BART approach and after implementation of the CAIR cap and trade program for EGUs. We then used the Regional Modeling System for Aerosols and Deposition (REMSAD) air quality model to project the visibility impact of these IPM emissions predictions for both the CAIR and the nationwide source-specific BART scenarios. Specifically, EPA evaluated the model results for the 20 percent best days (that is, least visibility impaired) and the 20 percent worst days at 44 Class I areas throughout the country. Thirteen of these Class I areas are within States affected by the CAIR proposal, and 31 Class I areas are outside the CAIR region—29 in States to the west of the CAIR region, and 2 in New England States northeast of the CAIR region.

As explained in the SNPR, the ''CAIR'' scenario modeled was imperfect for purposes of this analysis in that it assumed SO_2 reductions on a nationwide basis (rather than in the CAIR region only) and assumed NO_X reductions requirements in a slightly different geographic region than covered by the proposed CAIR. The ideal scenario would have correctly represented the geographic scope of the CAIR SO_2 and NO_X reduction requirements, and included source-specific BART controls in areas outside the CAIR region. (This corrected scenario has been modeled for the NFR, as explained below).

The SNPR REMSAD modeling showed that under the proposed two-pronged test, CAIR controls achieved equal or greater visibility improvement than the application of source-specific BART to EGUs nationwide. The modeling predicted that the CAIR cap and trade program will not result in degradation of visibility, compared to

[159] The question of whether section 169A(b)(2) requires BART based on contribution to impairment at any Class I area is separate from the question of whether this section requires source-specific BART under all circumstances. As noted earlier, we interpret section 169A(b)(2) as requiring BART only as needed to make reasonable progress, thus allowing for alternative measures which make greater reasonable progress.

NMED Exhibit 7f

existing (1998–2002) visibility conditions, at any of the 44 Class I areas considered. It also indicated that CAIR emissions reductions as modeled produce significantly greater visibility improvements than source-specific BART. Specifically, for the 15 Eastern Class I areas analyzed, the average visibility improvement (on the 20 percent worst days) expected solely as a result of the CAIR was 2.0 deciviews, and the average degree of improvement predicted for source-specific BART was 1.0 deciviews. Similarly, on a national basis, the visibility modeling showed that for all 44 Class I areas evaluated, the average visibility improvement, on the 20 percent worst days, in 2015 was 0.7 deciviews under the CAIR cap and trade program, but only 0.4 deciviews under the source-specific BART approach.

b. Comments and EPA Responses

Several commenters noted that EPA did not model the ''correct'' emissions scenarios to compare the CAIR and BART controls. They suggested that a model run with the CAIR controls in the East and BART controls in the West should be compared to a model run with nationwide BART controls.

The EPA agrees (as we have already noted in the SNPR) that the suggested comparison of model runs is a more appropriate comparison of the CAIR and BART. The SNPR better-than-BART analysis was limited by the availability of the model results at the time. For the NFR, we have modeled nationwide BART for EGUs as proposed in the May 2004 guidelines and a separate scenario consisting of CAIR reductions in the CAIR-affected States plus BART-reductions in the remaining States (excluding Alaska and Hawaii). Additionally, we have improved the BART control assumptions (in both scenarios) by increasing the number of BART-eligible units included. Specifically, in the SNPR analysis, controls were ''required'' (*i.e.*, assumed by the model) for BART-eligible EGUs greater than 250 MW capacity, for both NO_X and SO_2. For today's action, BART controls are assumed for SO_2 for all BART-eligible EGU units greater than 100 MW, and NO_X controls for all BART-eligible EGU units greater than 25 MW.[160] This, along with a review of potentially BART-eligible EGUs, has expanded the universe of units assumed subject to BART in the modeling from 302 to 491.[161]

Several commenters noted that the better-than-BART visibility analysis only covered 44 Class I areas and did not adequately address visibility in all areas of the country.

For the NFR, we have significantly expanded the number of Class I areas covered by the analysis. The NPR and SNPR visibility analysis was limited by the availability of observed data from Inter-agency Monitoring of Protected Visual Environments (IMPROVE) monitors during the meteorological modeling year of 1996. There was complete IMPROVE data at 44 IMPROVE sites which represented 68 Class I areas.[162] All of the regions of the country (as defined by IMPROVE) were represented by at least one site, except the Northern Great Lakes region. For the final rule, the modeling has been updated to use a meteorological year of 2001. Therefore, the IMPROVE data for 2001 was used for the NFR better-than-BART analysis. For 2001, there were 81 IMPROVE sites with complete data,[163] representing 116 Class I areas. The NFR analysis accounts for visibility changes at 80 percent of the active IMPROVE sites in the lower 48 States. More importantly for today's rulemaking, the number of Class I areas in the East has been increased from 15 to 29 and now covers all IMPROVE-defined visibility regions within the CAIR-affected States, including the Northern Great Lakes.[164] We, therefore, believe the expanded geographic scope of Class I areas covered is sufficient for purposes of this analysis.

c. Today's Action

We have compared the two model runs (BART nationwide and BART in the West with the CAIR in the East) using the proposed two-pronged better-than-BART test. The results were analyzed at the 116 Class I areas that have complete IMPROVE data for 2001 or are represented by IMPROVE monitors with complete data. Twenty-nine of the Class I areas are in the East and 87 are in the West. Detailed modeling results for all 116 Class I areas are contained in the Better-than-BART TSD.[165] Results applicable to the better-than-BART proposed two-pronged test are summarized below.

The updated visibility analysis reaffirms that under the proposed two-pronged test, CAIR controls are better than BART for EGUs. The modeling predicts that the CAIR cap and trade program will not result in degradation of visibility on the 20 percent best or 20 percent worst days compared to the 2015 baseline conditions, at any of the 116 Class I areas considered.[166]

With respect to the greater-average-improvement prong, the modeling indicates that CAIR emissions reductions in the East produce significantly greater visibility improvements than source-specific BART. Specifically, for the 29 Eastern Class I areas analyzed, the average visibility improvement, on the 20 percent worst days, expected solely as a result of the CAIR applied in the East and BART applied in the West is 1.6 dv, as compared to the average degree of improvement predicted for nationwide source-specific BART of 0.7 dv. Similarly, on a national basis, the visibility modeling showed that for all 116 Class I areas evaluated, the average visibility improvement, on the 20 percent worst days, in 2015 was 0.5 dv under the CAIR cap and trade program in the East and BART in the West, but only 0.2 deciviews under the nationwide source-specific BART approach.

The modeling showed similar results for the 20 percent best visibility days, although there is less visibility improvement on the best days compared to the worst days. For the 29 Eastern Class I areas analyzed, the average visibility improvement, on the 20 percent best days, expected solely as result of the CAIR applied in the East and BART applied in the West is 0.4 dv, as compared to the average degree of

[160] Because the presumptive controls in the BART guidelines are applicable to coal-fired EGUs, the BART analysis does not assume controls on oil- and gas-fired units. However, NO_X emissions from all (not just BART-eligible) oil and gas steam plants and simple cycle turbines in the CAIR region in the 2010 base case are projected to be about 40,000 tons, or less than 1.5% of the projected total 2010 EGU emissions. By comparison, the modeling of the scenario of the CAIR (with BART in the non-CAIR region) resulted in 640,000 tons of NO_X per year less than the projected emissions under a nationwide BART scenario. Therefore, even if the 40,000 tons of NO_X emissions from oil and gas EGUs were reduced to zero under the BART scenario, the CAIR will still produce significantly greater emission reductions than BART. Also, not all of the oil and gas units associated with those 40,000 tons would be eligible for BART. The IPM does not predict any difference in SO_2 emissions from oil or gas-fired units between the CAIR and BART.

[161] See ''Memo From Perrin Quarles Associates, Inc. Re Follow-Up on Units Potentially Affected by BART, July 19, 2004,'' as Appendix A to the ''Better than BART'' TSD.

[162] Some Class I areas do not have IMPROVE monitors and are represented by nearby IMPROVE sites.

[163] This is the number of IMPROVE sites that are located at or represent Class I areas. There are additional IMPROVE protocol monitoring sites that are not located at Class I areas.

[164] There are 5 Class I areas in the East and 33 Class I areas in the West (outside of the CAIR control region) that do not have complete IMPROVE data for 2001.

[165] ''Demonstration that CAIR Satisfies the 'Better-than-BART' Test As Proposed in the Guidelines for Making BART Determinations,'' March, 2005.

[166] See Better-than-BART TSD for results at each Class I Area.

NMED Exhibit 7f

improvement predicted for nationwide source-specific BART of 0.2 dv. On a national basis, the visibility modeling showed that for all 116 class I areas evaluated, the average visibility improvement, on the 20 percent best days, in 2015 was 0.1 dv under both the CAIR cap and trade program in the East and BART in the West, and under the nationwide source-specific BART approach. The results are summarized in table IX–1.

TABLE IX–1.—AVERAGE VISIBILITY IMPROVEMENT IN 2015 VS. 2015
Base Case (deciviews)

Class I Areas	CAIR + BART in West		Nationwide BART	
	East [167]	National	East	National
20% Worst Days	1.6	0.5	0.7	0.2
20% Best Days	0.4	0.1	0.2	0.1

The results clearly indicate that the CAIR will achieve greater reasonable progress than BART as proposed, measured by the proposed better-than-BART test. At this time, we can foresee no circumstances under which BART for EGUs could produce greater visibility improvement than the CAIR. However, for the reasons noted in section IX.C.1. above, we are deferring a final determination of whether the CAIR makes greater reasonable progress than BART until the BART guidelines for EGUs and the criteria for BART-alternative programs are finalized.

D. How Will EPA Handle State Petitions Under Section 126 of the CAA?

Section 126 of the CAA authorizes a downwind State to petition EPA for a finding that any new (or modified) or existing major stationary source or group of stationary sources upwind of the State emits or would emit in violation of the prohibition of section 110(a)(2)(D)(i) because their emissions contribute significantly to nonattainment, or interfere with maintenance, of a NAAQS in the State. If EPA makes such a finding, EPA is authorized to directly regulate the affected sources. Section 126 relies on the same statutory provision that underlies the CAIR.

In the January 30, 2004 CAIR proposal, EPA set forth its general view of the approach it expected to take in responding to any section 126 petition that might be submitted which relies on essentially the same record as the CAIR. That approach is the one EPA used in addressing section 126 petitions that were submitted to EPA in 1997 while EPA was developing the NO_X SIP Call to control ozone transport. In the NO_X SIP Call rule, we determined under section 110(a)(2)(D) that the SIP for each affected State (and the District of Columbia) must be revised to eliminate the amount of emissions that contributes significantly to nonattainment in downwind States. The emissions reductions requirement was based on the quantity of emissions that could be eliminated by the application of highly cost-effective controls on specified sources in that State. In May 1999, shortly after promulgation of the NO_X SIP Call, EPA took final action on the section 126 petitions (64 FR 28250; May 25, 1999). The Section 126 action relied on essentially the same record as the NO_X SIP Call. In addition, we established a section 126 remedy based on the same set of highly cost-effective controls. In the May 1999 Section 126 Rule, we determined which petitions had technical merit, but we stopped short of granting the findings for the petitions. Instead, we stated that because we had promulgated the NO_X SIP Call—a transport rule under section 110(a)(2)(D)—as long as an upwind State remained on track to comply with that rule, EPA would defer making the section 126 findings. The findings would be triggered at either of two future dates if specified progress had not been made by those times. The Section 126 Rule included a provision under which the rule would be automatically withdrawn for sources in a State once that State submitted and EPA fully approved a SIP that complied with the NO_X SIP Call. (See 64 FR 28271–28274; May 25, 1999.) The reason for this withdrawal would be the fact that the affected State's SIP revision would fulfill the section 110(a)(2)(D) requirements, so that there would no longer be any basis for the section 126 finding with respect to that State. In this manner, the NO_X SIP Call and the Section 126 Rules would be harmonized.

Under the CAIR proposal, EPA received comments regarding its intended approach for acting on any future section 126 petitions that might be filed. Many commenters expressed support for the approach that EPA had outlined. Other commenters raised issues regarding the timing of emissions reductions under a new section 126 action. Some pointed out that the CAIR compliance date would be later than the 3 years allowed for compliance under section 126. Some were concerned that the proposed CAIR compliance date is later than many attainment dates and States may need section 126 petitions in order to get earlier upwind reductions in order to meet their attainment dates. Some questioned the legal basis for linking the two rules. Several commenters expressed concern that EPA would be restricting the use of or weakening the section 126 provision. A number of commenters urged EPA not to prejudge any petition, but to evaluate each on its own merit. Some thought that any petitions submitted prior to designations or before States had had the opportunity to prepare SIPs would be premature and should be denied. Others suggested that CAIR might not solve all the transport problems and that States would need to retain the section 126 tool to seek further reductions.

After issuing the CAIR proposal, EPA received, on March 19, 2004, a section 126 petition from North Carolina seeking reductions in upwind NO_X and SO_2 for purposes of reducing $PM_{2.5}$ and 8-hour ozone levels in North Carolina. The petition relies in large part on the technical record for the proposed CAIR.

When we propose action on the North Carolina petition, we will set forth our view of the interaction between section 110(a)(2)(D) and section 126. In that proposal, we will take into consideration and respond to the section 126-related comments we received on the CAIR. The EPA will provide a comment period and opportunity for a public hearing on the specifics of that section 126 proposal, including an opportunity to comment on our view of the interaction of the 2 statutory provisions.

[167] Eastern Class I areas are those in the CAIR affected states, except areas in west Texas which are considered western and therefore included in the national average, plus those in New England.

NMED Exhibit 7f

E. Will Sources Subject to CAIR Also Be Subject to New Source Review?

The EPA did not propose any provisions in the CAIR related to new source review (NSR). Nonetheless, we received some comments on the relationship between CAIR and the NSR provisions that may apply to emissions sources also impacted by the CAIR. Many commenters indicated that if an EGU is part of an EPA-administered regional cap and trade program for NO_X and SO_2, then that EGU should be exempted from NSR for the covered pollutants. The commenters cited Clear Skies legislation as containing provisions affecting NSR for covered sources. In this final rule, EPA is not addressing or revising the provisions of NSR.

It should be noted that pollution control measures implemented by EGUs in compliance with the CAIR may be eligible for an exemption under the NSR pollution control project provision.[168] These provisions provide an exemption from major NSR for controls such as selective catalytic reduction (SCR) for NO_X control and wet scrubbers for SO_2 control, provided that certain conditions identified in the provisions are met.

X. Statutory and Executive Order Reviews

A. Executive Order 12866: Regulatory Planning and Review

Under Executive Order 12866 (58 FR 51735, October 4, 1993), the Agency must determine whether a regulatory action is ''significant'' and therefore subject to Office of Management and Budget (OMB) review and the requirements of the Executive Order. The Order defines ''significant regulatory action'' as one that is likely to result in a rule that may:

1. Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or Tribal governments or communities;

2. Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

3. Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

4. Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

[168] See 40 CFR 51.165(a)(1)(xxv) and 51.165(e), 40 CFR 51.166(b)(31) and 51.166(v), and 40 CFR 51.21(b)(32) and 52.21(z).

In view of its important policy implications and potential effect on the economy of over $100 million, this action has been judged to be an economically ''significant regulatory action'' within the meaning of the Executive Order. As a result, today's action was submitted to OMB for review, and EPA has prepared an economic analysis of the rule entitled ''Regulatory Impact Analysis of the Final Clean Air Interstate Rule'' (March 2005).

1. What Economic Analyses Were Conducted for the Rulemaking?

The analyses conducted for this final rule provide several important analyses of impacts on public welfare. These include an analysis of the social benefits, social costs, and net benefits of the regulatory scenario. The economic analyses also address issues involving small business impacts, unfunded mandates (including impacts for Tribal governments), environmental justice, children's health, energy impacts, and requirements of the Paperwork Reduction Act (PRA).

2. What Are the Benefits and Costs of This Rule?

The benefit-cost analysis shows that substantial net economic benefits to society are likely to be achieved due to reductions in emissions resulting from this rule. The results detailed below show that this rule would be highly beneficial to society, with annual net benefits (benefits less costs) of approximately $71.4 or $60.4 billion in 2010 and $98.5 or $83.2 billion in 2015. These alternative net benefits estimates occur due to differing assumptions concerning the social discount rate used to estimate the annual value of the benefits and costs of the rule with the lower estimates relating to a discount rate of 7 percent and the higher estimates a discount rate of 3 percent. All amounts are reflected in 1999 dollars.

The benefits and costs reported for the CAIR represent estimates for the final CAIR program that includes the CAIR promulgated rule and the concurrent proposal to include annual SO_2 and NO_X controls for New Jersey and Delaware. The modeling used to provide these estimates also assumes annual SO_2 and NO_X controls for Arkansas that are not a part of the final CAIR program resulting in a slight overstatement of the reported benefits and costs.

a. Control Scenario

Today's rule sets forth requirements for States to eliminate their significant contribution to down-wind nonattainment of the ozone and $PM_{2.5}$ NAAQS. In order to reduce this significant contribution, EPA requires that certain States reduce their emissions of SO_2 and NO_X. The EPA derived the quantities by calculating the amount of SO_2 and NO_X emissions that EPA believes can be controlled from the electric power industry in a highly cost-effective manner. The EPA considered all promulgated CAA requirements and known State actions in the baseline used to develop the estimates of benefits and costs for this rule. For a more complete description of the reduction requirements and how they were calculated, see section IV of today's rulemaking.

Although States may choose to obtain the emissions reductions from other source categories, for purposes of analyzing the impacts of the rule, EPA is assuming the application of the controls that it has identified to be highly cost effective on all EGUs in the transport region.

b. Cost Analysis and Economic Impacts

For the affected region, the projected annual private incremental costs of the CAIR to the power industry are $2.4 billion in 2010 and $3.6 billion in 2015. These costs represent the private compliance cost to the electric generating industry of reducing NO_X and SO_2 emissions to meet the caps set forth in the rule. Estimates are in 1999 dollars.

In estimating the net benefits of regulation, the appropriate cost measure is ''social costs.'' Social costs represent the welfare costs of the rule to society. These costs do not consider transfer payments (such as taxes) that are simply redistributions of wealth. The social costs of this rule are estimated to be approximately $1.9 billion in 2010 and $2.6 billion in 2015 assuming a 3 percent discount rate. These costs become $2.1 billion in 2010 and $3.1 billion in 2015 assuming a 7 percent discount rate.

Overall, the impacts of the CAIR are modest, particularly in light of the large benefits we expect. Ultimately, we believe the industry will pass along most of the costs of the rule to consumers, so that the costs of the rule will largely fall upon the consumers of electricity. Retail electricity prices are projected to increase roughly 2.0–2.7 percent with the CAIR in the 2010 and 2015 timeframe, and then drop below the 2.0 percent increase level thereafter. The effects of the CAIR on natural gas prices and the power-sector generation mix are relatively small, with a 1.6 percent or less increase in natural gas prices projected from 2010 to 2020.

There will be continued reliance on coal-fired generation, that is projected to remain at roughly 50 percent of total electricity generated. A relatively small amount of coal-fired capacity, about 5.3 GW (1.7 percent of all coal-fired capacity and 0.5 percent of all generating capacity), is projected to be uneconomic to maintain. For the most part, these units are small and infrequently used generating units that are dispersed throughout the CAIR region. Units projected to be uneconomic to maintain may be ''mothballed,'' retired, or kept in service to ensure transmission reliability in certain parts of the grid. The EPA's analysis does not address these choices.

As demand grows in the future, additional coal-fired generation is projected to be built under the CAIR. As a result, coal production for electricity generation is projected to increase from 2003 levels by about 15 percent in 2010 and 25 percent by 2020, and we expect a small shift towards greater coal production in Appalachia and the interior coal regions of the country with the CAIR.

For today's rule, EPA analyzed the costs using the Integrated Planning Model (IPM). The IPM is a dynamic linear programming model that can be used to examine the economic impacts of air pollution control policies for SO_2 and NO_X throughout the contiguous U.S. for the entire power system. Documentation for IPM can be found in the docket for this rulemaking or at *http://www.epa.gov/airmarkets/epa-ipm*.

c. Human Health Benefit Analysis

Our analysis of the health and welfare benefits anticipated from this rule are presented in this section. Briefly, the analysis projects major benefits from implementation of the rule in 2010 and 2015. As described below, thousands of deaths and other serious health effects would be prevented. We are able to monetize annual benefits of approximately $73.3 or $62.6 billion in 2010 (based upon a 3 percent or 7 percent discount rate, respectively) and $101 billion or $86.3 billion in 2015 (based upon a discount rate of 3 percent or 7 percent, respectively, 1999 dollars).

Table X–1 presents the primary estimates of reduced incidence of PM- and ozone-related health effects for the years 2010 and 2015 for the regulatory control strategy. In 2015, we estimate that PM-related annual benefits include approximately 17,000 fewer premature fatalities, 8,700 fewer cases of chronic bronchitis, 22,000 fewer non-fatal heart attacks, 10,500 fewer hospitalizations (for respiratory and cardiovascular disease combined) and result in significant reductions in days of restricted activity due to respiratory illness (with an estimate of 9.9 million fewer cases) and approximately 1,700,000 fewer work-loss days. We also estimate substantial health improvements for children from reduced upper and lower respiratory illness, acute bronchitis, and asthma attacks.

Ozone health-related benefits are expected to occur during the summer ozone season (usually ranging from May to September in the Eastern U.S.). Based upon modeling for 2015, annual ozone-related health benefits are expected to include 2,800 fewer hospital admissions for respiratory illnesses, 280 fewer emergency room admissions for asthma, 690,000 fewer days with restricted activity levels, and 510,000 fewer days where children are absent from school due to illnesses.

While we did not include in our primary benefits analysis separate estimates of the number of premature deaths that would be avoided due to reductions in ozone levels, recent studies suggest a link between short-term ozone exposures with premature mortality independent of PM exposures. Based upon a recent report by Thurston and Ito, (2001),[169] the EPA Science Advisory Board has recommended that EPA reevaluate the ozone mortality literature for possible inclusion of ozone mortality in the estimate of total benefits. More recently, a comprehensive analysis using data from the National Morbidity, Mortality and Air Pollution Study (NMMAPS) found a significant association between daily ozone levels and daily mortality rates (Bell *et al.* 2004).[170] The analysis estimated a 0.5 percent increase in daily mortality associated with a 10 ppb increase in ozone, based on data from 95 major urban areas. Using a similar magnitude effect estimate, sensitivity analysis estimates suggest that in 2015, the CAIR would result in an additional 500 fewer premature deaths annually due to reductions in daily ambient ozone concentrations. The EPA has sponsored three independent meta-analyses of the ozone mortality epidemiology literature to inform a determination on inclusion of this important health impact in the primary benefits analysis for future regulations.

Table X–2 presents the estimated monetary value of reductions in the incidence of health and welfare effects. Annual PM-related and ozone-related health benefits are estimated to be approximately $72.1 or $61.4 billion in 2010 (3 percent and 7 percent discount rate, respectively) and $99.3 or $84.5 billion in 2015 (3 percent or 7 percent discount rate, respectively). Estimated annual visibility benefits in southeastern Class I areas are approximately $1.14 billion in 2010 and $1.78 billion in 2015. All monetized estimates are stated in 1999$. These estimates account for growth in real gross domestic product (GDP) per capita between the present and the years 2010 and 2015. As the table indicates, total benefits are driven primarily by the reduction in premature fatalities each year, that accounts for over 90 percent of total benefits.

Table X–3 presents the total monetized net benefits for the years 2010 and 2015. This table also indicates with a ''B'' those additional health and environmental benefits of the rule that we were unable to quantify or monetize. These effects are additive to the estimate of total benefits. A listing of the benefit categories that could not be quantified or monetized in our benefit estimates are provided in Table X–4. We are not able to estimate the magnitude of these unquantified and unmonetized benefits. While EPA believes there is considerable value to the public for the PM-related benefit categories that could not be monetized, we believe these benefits may be small relative to those categories we were able to quantify and monetize. In contrast, EPA believes the monetary value of the ozone-related premature mortality benefits could be substantial. As previously discussed, we estimate that ozone mortality benefits may yield as many as 500 reduced premature mortalities per year and may increase the benefits of CAIR by approximately $3 billion annually.

d. Quantified and Monetized Welfare Benefits

Only a subset of the expected visibility benefits—those for Class I areas in the southeastern U.S. are included in the monetary benefits estimates we project for this rule. We believe the benefits associated with these non-health benefit categories are likely significant. For example, we are able to quantify significant visibility improvements in Class I areas in the Northeast and Midwest, but are unable at present to place a monetary value on these improvements. Similarly, we

[169] Thurston, G.D. and K. Ito. 2001. ''Epidemiological Studies of Acute Ozone Exposures and Mortality''. *J. Expo Anal Environ Epidemiology* 11 (4) :286–294.

[170] Bell, M.L., A. McDermott, S. Zeger, J. Samet, F. Dominichi. 2005. ''Ozone and Mortality in 95 U.S. Urban Communities from 1987 to 2000.'' *Journal of the American Medical Association*. Forthcoming.

NMED Exhibit 7f

anticipate improvement in visibility in residential areas where people live, work and recreate within the CAIR region for which we are currently unable to monetize benefits. For the Class I areas in the southeastern U.S., we estimate annual benefits of $1.78 billion beginning in 2015 for visibility improvements. The value of visibility benefits in areas where we were unable to monetize benefits could also be substantial.

We also quantify nitrogen and sulfur deposition reductions expected to occur as a result of the CAIR and discuss potential benefits from these reductions in section X.A.4 of this preamble. While we are unable to estimate a dollar value associated with these benefits, we are able to quantify acidification improvements in lakes in the Northeast including the Adirondacks and potential benefits of reductions in nitrogen deposition to estuaries such as the Chesapeake Bay.

TABLE X–1.—ESTIMATED ANNUAL REDUCTIONS IN INCIDENCE OF HEALTH EFFECTS [a]

Health Effect	2010 annual incidence reduction	2015 annual incidence reduction
PM–Related endpoints		
Premature Mortality [b, c].		
Adult, age 30 and over	13,000	17,000
Infant, age <1 year	29	36
Chronic bronchitis (adult, age 26 and over)	6,900	8,700
Non-fatal myocardial infarction (adult, age 18 and over)	17,000	22,000
Hospital admissions—respiratory (all ages) [d]	4,300	5,500
Hospital admissions—cardiovascular (adults, age >18) [e]	3,800	5,000
Emergency room visits for asthma (age 18 years and younger)	10,000	13,000
Acute bronchitis, (children, age 8–12)	16,000	19,000
Lower respiratory symptoms (children, age 7–14)	190,000	230,000
Upper respiratory symptoms (asthmatic children, age 9–18)	150,000	180,000
Asthma exacerbation (asthmatic children, age 6–18)	240,000	290,000
Work Loss Days	1,400,000	1,700,000
Minor restricted activity days (adults age 18–65)	8,100,000	9,900,000
Ozone-Related endpoints		
Hospital admissions—respiratory causes (adult, 65 and older) [f]	610	1,700
Hospital admissions—respiratory causes (children, under 2)	380	1,100
Emergency room visit for asthma (all ages)	100	280
Minor restricted activity days (adults, age 18–65)	280,000	690,000
School absence days	180,000	510,000

[a] Incidences are rounded to two significant digits. These estimates represent benefits from the CAIR nationwide. The modeling used to derive these incidence estimates are reflective of those expected for the final CAIR program including the CAIR promulgated rule and the proposal to include annual SO_2 and NO_X controls for New Jersey and Delaware. Modeling used to develop these estimates assumes annual SO_2 and NO_X controls for Arkansas resulting in a slight overstatement of the reported benefits and costs for the complete CAIR program.
[b] Premature mortality benefits associated with ozone are not analyzed in the primary analysis.
[c] Adult mortality based upon studies by Pope, *et al.* 2002.[171] Infant mortality based upon studies by Woodruff, Grillo, and Schoendorf,1997.[172]
[d] Respiratory hospital admissions for PM include admissions for chronic obstructive pulmonary disease (COPD), pneumonia and asthma.
[e] Cardiovascular hospital admissions for PM include total cardiovascular and subcategories for ischemic heart disease, dysrhythmias, and heart failure.
[f] Respiratory hospital admissions for ozone include admissions for all respiratory causes and subcategories for COPD and pneumonia.

TABLE X–2.—ESTIMATED ANNUAL MONETARY VALUE OF REDUCTIONS IN INCIDENCE OF HEALTH AND WELFARE EFFECTS

[Millions of 1999$] [a, b]

Health effect	Pollutant	2010 estimated value of reductions	2015 estimated value of reductions
Premature mortality [c, d]			
Adult >30 years	....	....	....
3 percent discount rate	$PM_{2.5}$	$67,300	$92,800
7 percent discount rate	....	56,600	78,100
Child <1 year	....	168	222
Chronic bronchitis (adults, 26 and over)	$PM_{2.5}$	2,520	3,340
Non-fatal acute myocardial infarctions			
3 percent discount rate	$PM_{2.5}$	1,420	1,850
7 percent discount rate	....	1,370	1,790

NMED Exhibit 7f

TABLE X–2.—ESTIMATED ANNUAL MONETARY VALUE OF REDUCTIONS IN INCIDENCE OF HEALTH AND WELFARE EFFECTS—Continued

[Millions of 1999$] [a, b]

Health effect	Pollutant	2010 estimated value of reductions	2015 estimated value of reductions
Hospital admissions for respiratory causes	$PM_{2.5}$, O3	45.2	78.9
Hospital admissions for cardiovascular causes	$PM_{2.5}$	80.7	105
Emergency room visits for asthma	$PM_{2.5}$, O3	2.84	3.56
Acute bronchitis (children, age 8–12)	$PM_{2.5}$	5.63	7.06
Lower respiratory symptoms (children, age 7–14)	$PM_{2.5}$	2.98	3.74
Upper respiratory symptoms (asthma, age 9–11)	$PM_{2.5}$	3.80	4.77
Asthma exacerbations	$PM_{2.5}$	10.3	12.7
Work loss days	$PM_{2.5}$,	180	219
Minor restricted activity days (MRADs)	$PM_{2.5}$, O3	422	543
School absence days	O3	12.9	36.4
Worker productivity (outdoor workers, age 18–65)	O3	7.66	19.9
Recreational visibility, 81 Class I areas	$PM_{2.5}$	1,140	1,780
Monetized Total [e]			
Base estimate			
3 percent discount rate	$PM_{2.5}$, O3	73,300 + B	101,000 + B
7 percent discount rate		62,600 + B	86,300 + B

[a] Monetary benefits are rounded to three significant digits. These estimates represent benefits from the CAIR nationwide for NO_X and SO_2 emissions reductions from electricity-generating units sources (with the exception of ozone and visibility benefits). Ozone benefits relate to the eastern United States. Visibility benefits relate to Class I areas in the southeastern United States. The benefit estimates reflected relate to the final CAIR program that includes the CAIR promulgated rule and the proposal to include annual SO_2 and NO_X controls for New Jersey and Delaware. Modeling used to develop these estimates assumes annual SO_2 and NO_X controls for Arkansas resulting in a slight overstatement of the reported benefits and costs for the complete CAIR program.

[b] Monetary benefits adjusted to account for growth in real GDP per capita between 1990 and the analysis year (2010 or 2015).

[c] Valuation assumes discounting over the SAB recommended 20 year segmented lag structure described in the Regulatory Impact Analysis for the Final Clean Air Interstate Rule (March 2005). Results show 3 percent and 7 percent discount rates consistent with EPA and OMB guidelines for preparing economic analyses (US EPA, 2000 and OMB, 2003).[173]

[d] Adult mortality based upon studies by Pope *et al.* 2002. Infant mortality based upon studies by Woodruff, Grillo, and Schoendorf, 1997.

[e] B represents the monetary value of health and welfare benefits not monetized. A detailed listing is provided in Table X–4.

3. How Do the Benefits Compare to the Costs of This Final Rule?

The estimated annual private costs to implement the emission reduction requirements of the final rule for the CAIR region are $2.36 in 2010 and $3.57 billion in 2015 (1999$). These costs are the annual incremental electric generation production costs that are expected to occur with the CAIR. The EPA uses these costs as compliance cost estimates in developing cost-effectiveness estimates.

In estimating the net benefits of regulation, the appropriate cost measure is ''social costs.'' Social costs represent the welfare costs of the rule to society. These costs do not consider transfer payments (such as taxes) that are simply redistributions of wealth. The social costs of this rule are estimated to be approximately $1.9 billion in 2010 and $2.6 billion in 2015 assuming a 3 percent discount rate. These costs become $2.1 billion in 2010 and $3.1 billion in 2015, if one assumes a 7 percent discount rate. Thus, the net benefit (social benefits minus social costs) of the program is approximately $71.4 + B billion or $60.4 + B billion (3 percent and 7 percent discount rate, respectively) annually in 2010 and $98.5 + B billion or $83.2 + B billion annually (3 percent and 7 percent discount rate, respectively) in 2015. Implementation of the rule is expected to provide society with a substantial net gain in social welfare based on economic efficiency criteria.

The annualized regional cost of the CAIR, as quantified here, is EPA's best assessment of the cost of implementing the CAIR, assuming that States adopt the model cap and trade program. These costs are generated from rigorous economic modeling of changes in the power sector due to the CAIR. This type of analysis using IPM has undergone peer review and been upheld in Federal courts. The direct cost includes, but is not limited to, capital investments in pollution controls, operating expenses of the pollution controls, investments in new generating sources, and additional fuel expenditures. The EPA believes that these costs reflect, as closely as possible, the additional costs of the CAIR to industry. The relatively small cost associated with monitoring emissions, reporting, and recordkeeping for affected sources is not included in these annualized cost estimates, but EPA has done a separate analysis and estimated the cost to less than $42 million (see section X. B., Paperwork Reduction Act). However, there may exist certain costs that EPA has not quantified in these estimates. These costs may include costs of transitioning to the CAIR, such as the costs associated with the retirement of smaller or less efficient EGUs, employment shifts as workers are retrained at the same company or re-employed elsewhere in the economy, and certain relatively small permitting costs associated with title IV that new program entrants face. Costs may be understated since an optimization model was employed that assumes cost minimization, and the regulated community may not react in the same manner to comply with the rules. Although EPA has not quantified these costs, the Agency believes that they are small compared to the quantified costs of the program on the power sector. The annualized cost estimates presented are the best and most accurate based upon available information. In a separate analysis, EPA estimates the indirect costs and impacts of higher electricity prices on the entire economy [see Regulatory Impact Analysis for the Final Clean Air Interstate Rule, Appendix E (March 2005)].

The costs presented here are EPA's best estimate of the direct private costs of the CAIR. For purposes of benefit-cost analysis of this rule, EPA has also estimated the additional costs of the CAIR using alternate discount rates for calculating the social costs, parallel to the range of discount rates used in the estimates of the benefits of the CAIR (3 percent and 7 percent). Using these alternate discount rates, the social costs of the CAIR are $1.9 billion in 2010 and $2.6 billion in 2015 using a discount rate of 3 percent, and $2.1 billion in 2010 and $3.1 billion in 2015 using a discount rate of 7 percent. The costs of the CAIR using the adjusted discount rates are lower than the private costs of the CAIR generated using IPM because the social costs do not include certain transfer payments, primarily taxes, that are considered a redistribution of wealth rather than a social cost.[174]

TABLE X–3.—SUMMARY OF ANNUAL BENEFITS, COSTS, AND NET BENEFITS OF THE CLEAN AIR INTERSTATE RULE [a]

[Billions of 1999 dollars]

Description	2010 (Billions of 1999 dollars)	2015 (Billions of 1999 dollars)
Social Costs: [b]		
3 percent discount rate	$1.91	$2.56
7 percent discount rate	2.14	3.07
Social Benefits: [c,d,e]		
3 percent discount rate	73.3 + B	101 + B
7 percent discount rate	62.6 + B	86.3 + B
Health-related benefits:		
3 percent discount rate	72.1 + B	99.3 + B
7 percent discount rate	61.4 + B	84.5 + B
Visibility benefits	1.14 + B	1.78 + B
Annual Net Benefits (Benefits-Costs): [e,f]		
3 percent discount rate	71.4 + B	98.5 + B
7 percent discount rate	60.4 + B	83.2 + B

[a] All estimates are rounded to three significant digits and represent annualized benefits and costs anticipated for the years 2010 and 2015. Estimates relate to the complete CAIR program including the CAIR promulgated rule and the proposal to include annual SO_2 and NO_X controls for New Jersey and Delaware. Modeling used to develop these estimates assumes annual SO_2 and NO_X controls for Arkansas resulting in a slight overstatement of the reported benefits and costs for the complete CAIR program.

[b] Note that costs are the annual total costs of reducing pollutants including NO_X and SO_2 in the CAIR region.

[c] As this table indicates, total benefits are driven primarily by PM-related health benefits. The reduction in premature fatalities each year accounts for over 90 percent of total monetized benefits in 2015. Benefits in this table are nationwide (with the exception of ozone and visibility) and are associated with NO_X and SO_2 reductions for the EGU source category. Ozone benefits represent benefits in the eastern United States. Visibility benefits represent benefits in Class I areas in the southeastern United States.

[d] Not all possible benefits or disbenefits are quantified and monetized in this analysis. B is the sum of all unquantified benefits and disbenefits. Potential benefit categories that have not been quantified and monetized are listed in Table X–4.

[e] Valuation assumes discounting over the SAB-recommended 20 year segmented lag structure described in chapter 4 of the Regulatory Impact Analysis for the Clean Air Interstate Rule (March 2005). Results reflect 3 percent and 7 percent discount rates consistent with EPA and OMB guidelines for preparing economic analyses (U.S. EPA, 2000 and OMB, 2003).[174]

[f] Net benefits are rounded to the nearest $100 million. Columnar totals may not sum due to rounding.

Every benefit-cost analysis examining the potential effects of a change in environmental protection requirements is limited to some extent by data gaps, limitations in model capabilities (such as geographic coverage), and uncertainties in the underlying scientific and economic studies used to configure the benefit and cost models. Gaps in the scientific literature often result in the inability to estimate quantitative changes in health and environmental effects. Gaps in the economics literature often result in the inability to assign economic values even to those health and environmental outcomes that can be quantified. While uncertainties in the underlying scientific and economics literatures (that may result in overestimation or underestimation of benefits) are discussed in detail in the economic analyses and its supporting documents and references, the key uncertainties which have a bearing on the results of the benefit-cost analysis of this rule include the following:

- EPA's inability to quantify potentially significant benefit categories;
- Uncertainties in population growth and baseline incidence rates;
- Uncertainties in projection of emissions inventories and air quality into the future;
- Uncertainty in the estimated relationships of health and welfare effects to changes in pollutant concentrations including the shape of the C–R function, the size of the effect estimates, and the relative toxicity of the many components of the PM mixture;
- Uncertainties in exposure estimation; and
- Uncertainties associated with the effect of potential future actions to limit emissions.

Despite these uncertainties, we believe the benefit-cost analysis provides a reasonable indication of the expected economic benefits of the rulemaking in future years under a set of reasonable assumptions.

In valuing reductions in premature fatalities associated with PM, we used a value of $5.5 million per statistical life. This represents a central value consistent with a range of values from $1 to $10 million suggested by recent meta-analyses of the wage-risk value of statistical life (VSL) literature.[175]

The benefits estimates generated for this rule are subject to a number of assumptions and uncertainties, that are discussed throughout the Regulatory Impact Analysis document [Regulatory

[174] United States Environmental Protection Agency, 2000. Guidelines for Preparing Economic Analyses. *www.yosemitel.epa.gov/ee/epa/eed/hsf/pages/Guideline.html.* Office of Management and Budget, The Executive Office of the President, 2003. Circular A–4. *http://www.whitehouse.gov/omb/circulars.*

NMED Exhibit 7f

Impact Analysis for the Final Clean Air Interstate Rule (March 2005)]. As Table X–2 indicates, total benefits are driven primarily by the reduction in premature fatalities each year. Elaborating on the previous uncertainty discussion, some key assumptions underlying the primary estimate for the premature mortality category include the following:

(1) EPA assumes inhalation of fine particles is causally associated with premature death at concentrations near those experienced by most Americans on a daily basis. Plausible biological mechanisms for this effect have been hypothesized for the endpoints included in the primary analysis and the weight of the available epidemiological evidence supports an assumption of causality.

(2) EPA assumes all fine particles, regardless of their chemical composition, are equally potent in causing premature mortality. This is an important assumption, because the proportion of certain components in the PM mixture produced via precursors emitted from EGUs may differ significantly from direct PM released from automotive engines and other industrial sources, but no clear scientific grounds exist for supporting differential effects estimates by particle type.

(3) EPA assumes the C–R function for fine particles is approximately linear within the range of ambient concentrations under consideration. In the PM Criteria Document, EPA recognizes that for individuals and specific health responses there are likely threshold levels, but there remains little evidence of thresholds for PM-related effects in populations.[176] Where potential threshold levels have been suggested, they are at fairly low levels with increasing uncertainty about effects at lower ends of the $PM_{2.5}$ concentration ranges. Thus, EPA estimates include health benefits from reducing the fine particles in areas with varied concentrations of PM, including both regions that are in attainment with fine particle standard and those that do not meet the standard.

The EPA recognizes the difficulties, assumptions, and inherent uncertainties in the overall enterprise. The analyses upon which the CAIR is based were selected from the peer-reviewed scientific literature. We used up-to-date assessment tools, and we believe the results are highly useful in assessing this rule.

[176] U.S. EPA. (2004). Air Quality Criteria for Particulate Matter. Research Triangle Park, NC: National Center for Environmental Assessment—RTP Office; Report No. EPA/600/P–99/002aD.

There are a number of health and environmental effects that we were unable to quantify or monetize. A complete benefit-cost analysis of the CAIR requires consideration of all benefits and costs expected to result from the rule, not just those benefits and costs which could be expressed here in dollar terms. A listing of the benefit categories that were not quantified or monetized in our estimate are provided in Table X–4. These effects are denoted by ''B'' in Table X–3 above, and are additive to the estimates of benefits.

4. What Are the Unquantified and Unmonetized Benefits of the CAIR Emissions Reductions?

Important benefits beyond the human health and welfare benefits resulting from reductions in ambient levels of $PM_{2.5}$ and ozone are expected to occur from this rule. These other benefits occur both directly from NO_X and SO_2 emissions reductions, and indirectly through reductions in co-pollutants such as mercury. These benefits are listed in Table X–4. Some of the more important examples include: Reductions in NO_X and SO_2 emissions required by the CAIR will reduce acidification and, in the case of NO_X, eutrophication of water bodies. Reduced nitrate contamination of drinking water is another possible benefit of the rule. This final rule will also reduce acid and particulate deposition that cause damages to cultural monuments, as well as, soiling and other materials damage.

To illustrate the important nature of benefit categories we are currently unable to monetize, we discuss two categories of public welfare and environmental impacts related to reductions in emissions required by the CAIR: Reduced acid deposition and reduced eutrophication of water bodies.

a. What Are the Benefits of Reduced Deposition of Sulfur and Nitrogen to Aquatic, Forest, and Coastal Ecosystems?

Atmospheric deposition of sulfur and nitrogen, more commonly known as acid rain, occurs when emissions of SO_2 and NO_X react in the atmosphere (with water, oxygen, and oxidants) to form various acidic compounds. These acidic compounds fall to earth in either a wet form (rain, snow, and fog) or a dry form (gases and particles). Prevailing winds can transport acidic compounds hundreds of miles, across State borders. Acidic compounds (including small particles such as sulfates and nitrates) cause many negative environmental effects, including acidification of lakes and streams, harm to sensitive forests, and harm to sensitive coastal ecosystems.

i. Acid Deposition and Acidification of Lakes and Streams

The extent of adverse effects of acid deposition on freshwater and forest ecosystems depends largely upon the ecosystem's ability to neutralize the acid. The neutralizing ability [key indicator is termed Acid Neutralizing Capacity (ANC)] depends largely on the watershed's physical characteristics: Geology, soils, and size. Waters that are sensitive to acidification tend to be located in small watersheds that have few alkaline minerals and shallow soils. Conversely, watersheds that contain alkaline minerals, such as limestone, tend to have waters with a high ANC. Areas especially sensitive to acidification include portions of the Northeast (particularly, the Adirondack and Catskill Mountains, portions of New England, and streams in the mid-Appalachian highlands) and southeastern streams.

Some of the impacts of today's rulemaking on acidification of water bodies have been quantified. In particular, this rule will result in improvements in the acid buffering capacity for lakes in the Northeast and Adirondack Mountains. Specifically, 12 percent of Adirondack lakes are projected to be chronically acidic in the base case. However, we project that the CAIR rule will eliminate chronic acidification in lakes in the Adirondack Mountains by 2030. In addition, today's rule is expected to decrease the percentage of chronically acidic lakes throughout Northeast from 6 to 1 percent. However, some lakes in the Adirondacks and New England will continue to experience episodic acidification even after implementation of this rule.

In a recent study,[177] Resources for the Future (RFF) estimates total benefits (*i.e.*, the sum of use and nonuse values) of natural resource improvements for the Adirondacks resulting from a program that would reduce acidification in 40 percent of the lakes in the Adirondacks that were of concern for acidification. While this study requires further evaluation, the RFF study suggests that the benefits of acid deposition reductions for the CAIR are likely to be substantial in terms of the total monetized value for ecological endpoints (although likely small in

[177] Banzhaf, Spencer, Dallas Burtraw, David Evans, and Alan Krupnick. ''Valuation of Natural Resource Improvements in the Adirondacks,'' Resources for the Future (RFF), September 2004.

NMED Exhibit 7f

comparison to the estimated premature mortality benefits estimates).

ii. Acid Deposition and Forest Ecosystem Impacts

Current understanding of the effects of acid deposition on forest ecosystems focuses on the effects of ecological processes affecting plant uptake, retention, and cycling of nutrients within forest ecosystems. Recent studies indicate that acid deposition is at least partially responsible for decreases in base cations (calcium, magnesium, potassium, and others) from soils in the northeastern and southeastern United States. Losses of calcium from forest soils and forested watersheds have now been documented as a sensitive early indicator of soil response to acid deposition for a wide range of forest soils in the United States.

In red spruce stands, a clear link exists between acid deposition, calcium supply, and sensitivity to abiotic stress. Red spruce uptake and retention of calcium is impacted by acid deposition in two main ways: Leaching of important stores of calcium from needles and decreased root uptake of calcium due to calcium depletion from the soil and aluminum mobilization. These changes increase the sensitivity of red spruce to winter injuries under normal winter conditions in the Northeast, result in the loss of needles, slow tree growth, and impair the overall health and productivity of forest ecosystems in many areas of the eastern United States. In addition, recent studies of sugar maple decline in the Northeast demonstrate a link between low base cation availability, high levels of aluminum and manganese in the soil, and increased levels of tree mortality due to native defoliating insects.

Although sulfate is the primary cause of base cation leaching, nitrate is a significant contributor in watersheds that are nearly nitrogen saturated. Base cation depletion is a cause for concern because of the role these ions play in surface water acid neutralization and their importance as essential nutrients for tree growth (calcium, magnesium and potassium).

This regulatory action will decrease acid deposition in the transport region and is likely to have positive effects on the health and productivity of forest systems in the region.

iii. Coastal Ecosystems

Since 1990, a large amount of research has been conducted on the impact of nitrogen deposition to coastal waters. Nitrogen is often the limiting nutrient in coastal ecosystems. Increasing the levels of nitrogen in coastal waters can cause significant changes to those ecosystems. In recent decades, human activities have accelerated nitrogen nutrient inputs, causing excessive growth of algae and leading to degraded water quality and associated impairments of estuarine and coastal resources.

Atmospheric deposition of nitrogen is a significant source of nitrogen to many estuaries. The amount of nitrogen entering estuaries due to atmospheric deposition varies widely, depending on the size and location of the estuarine watershed and other sources of nitrogen in the watershed. There are a few estuaries where atmospheric deposition of nitrogen contributes well over 40 percent of the total nitrogen load; however, in most estuaries for which estimates exist, the contribution from atmospheric deposition ranges from 15–30 percent. The area of the country with the highest air deposition rates (30 percent deposition rates) includes many estuaries along the northeast seaboard from Massachusetts to the Chesapeake Bay and along the central Gulf of Mexico coast.

In 1999, National Oceanic and Atmospheric Administration (NOAA) published the results of a 5-year national assessment of the severity and extent of estuarine eutrophication. An estuary is defined as the inland arm of the sea that meets the mouth of a river. The 138 estuaries characterized in the study represent more than 90 percent of total estuarine water surface area and the total number of U.S. estuaries. The study found that estuaries with moderate to high eutrophication represented 65 percent of the estuarine surface area.

Eutrophication is of particular concern in coastal areas with poor or stratified circulation patterns, such as the Chesapeake Bay, Long Island Sound, and the Gulf of Mexico. In such areas, the ''overproduced'' algae tends to sink to the bottom and decay, using all or most of the available oxygen and thereby reducing or eliminating populations of bottom-feeder fish and shellfish, distorting the normal population balance between different aquatic organisms, and in extreme cases, causing dramatic fish kills. Severe and persistent eutrophication often directly impacts human activities. For example, fishery resource losses can be caused directly by fish kills associated with low dissolved oxygen and toxic blooms. Declines in tourism occur when low dissolved oxygen causes noxious smells and floating mats of algal blooms create unfavorable aesthetic conditions. Risks to human health increase when the toxins from algal blooms accumulate in edible fish and shellfish, and when toxins become airborne, causing respiratory problems due to inhalation. According to the NOAA report, more than half of the nation's estuaries have moderate to high expressions of at least one of these symptoms'an indication that eutrophication is well developed in more than half of U.S. estuaries.

This rule is anticipated to reduce nitrogen deposition in the CAIR region. Thus, reductions in the levels of nitrogen deposition will have a positive impact upon current eutrophic conditions in estuaries and coastal areas in the region. While we are unable to monetize the benefits of such reductions, the Chesapeake Bay Program estimated the reduced mass of delivered nitrogen loads likely to result from the CAIR, based upon the CAIR proposal deposition estimates published in January 2004. Atmospheric deposition of nitrogen accounts for a significant portion of the nitrogen loads to the Chesapeake with 28 percent of the nitrogen loads from the watershed coming from air deposition. Based upon the CAIR proposal, nitrogen deposition rates published in the January 2004 proposal, the Chesapeake Bay Program finds that the CAIR will likely reduce the nitrogen loads to the Bay by 10 million pounds per year by 2010.[178] These substantial nitrogen load reductions more than fulfill the EPA's commitment to reduce atmospheric deposition delivered to the Chesapeake Bay by 8 million pounds.

b. Are There Health or Welfare Disbenefits of the CAIR That Have Not Been Quantified?

In contrast to the additional benefits of the rule discussed above, it is also possible that this rule will result in disbenefits in some areas of the region. Current levels of nitrogen deposition in these areas may provide passive fertilization for forest and terrestrial ecosystems where nutrients are a limiting factor and for some croplands.

The effects of ozone and PM on radiative transfer in the atmosphere can also lead to effects of uncertain magnitude and direction on the penetration of ultraviolet light and climate. Ground level ozone makes up a small percentage of total atmospheric ozone (including the stratospheric layer) that attenuates penetration of ultraviolet—b (UVb) radiation to the ground. The EPA's past evaluation of the information indicates that potential disbenefits would be small, variable, and with too many uncertainties to attempt quantification of relatively

[178] Sweeney, Jeff. ''EPA's Chesapeake Bay Program Air Strategy.'' October 26, 2004.

NMED Exhibit 7f

small changes in average ozone levels over the course of a year (EPA, 2005a). The EPA's most recent provisional assessment of the currently available information indicates that potential but unquantifiable benefits may also arise from ozone-related attenuation of UVb radiation (EPA, 2005b). Sulfate and nitrate particles also scatter UVb, which can decrease exposure of horizontal surfaces to UVb, but increase exposure of vertical surfaces. In this case as well, both the magnitude and direction of the effect of reductions in sulfate and nitrate particles are too uncertain to quantify (EPA, 2004). Ozone is a greenhouse gas, and sulfates and nitrates can reduce the amount of solar radiation reaching the earth, but EPA believes that we are unable to quantify any net climate-related disbenefit or benefit associated with the combined ozone and PM reductions in this rule.

TABLE X–4.—UNQUANTIFIED AND NON-MONETIZED EFFECTS OF THE CLEAN AIR INTERSTATE RULE

Pollutant/effects	Effects not included in primary estimates—Changes in:
Ozone Health [a]	Premature mortality [b] Chronic respiratory damage Premature aging of the lungs Non-asthma respiratory emergency room visits Increased exposure to UVb
Ozone Welfare	Yields for –commercial forests –fruits and vegetables –commercial and non-commercial crops Damage to urban ornamental plants Impacts on recreational demand from damaged forest aesthetics Ecosystem functions Increased exposure to UVb
PM Health [c]	Premature mortality—short term exposures [d] Low birth weight Pulmonary function Chronic respiratory diseases other than chronic bronchitis Non-asthma respiratory emergency room visits Exposure to UVb (+/¥) [e]
PM Welfare	Visibility in many Class I areas Residential and recreational visibility in non-Class I areas Soiling and materials damage Damage to ecosystem functions Exposure to UVb (+/¥) [e]
Nitrogen and Sulfate Deposition Welfare	Commercial forests due to acidic sulfate and nitrate deposition Commercial freshwater fishing due to acidic deposition Recreation in terrestrial ecosystems due to acidic deposition Existence values for currently healthy ecosystems Commercial fishing, agriculture, and forests due to nitrogen deposition Recreation in estuarine ecosystems due to nitrogen deposition Ecosystem functions Passive fertilization
Mercury Health	Incidences of neurological disorders Incidences of learning disabilities Incidences of developmental delays Potential reproductive effects [f] Potential cardiovascular effects,[f] including: –Altered blood pressure regulation [f] –Increased heart rate variability [f] –Myocardial infarction [f]
Mercury Deposition Welfare	Impact on birds and mammals (*e.g.*, reproductive effects) Impacts to commercial, subsistence, and recreational fishing

Notes:

[a] In addition to primary economic endpoints, there are a number of biological responses that have been associated with ozone health effects including increased airway responsiveness to stimuli, inflamation in the lung, acute inflammation and respiratory cell damage, and increased susceptibility to respiratory infection. The public health impact of these biological responses may be partly represented by our quantified endpoints.

[b] Premature mortality associated with ozone is not currently included in the primary analysis. Recent evidence suggests that short-term exposures to ozone may have a significant effect on daily mortality rates, independent of exposure to PM. EPA is currently conducting a series of meta-analyses of the ozone mortality epidemiology literature. EPA will consider including ozone mortality in primary benefits analyses once a peer reviewed methodology is available.

[c] In addition to primary economic endpoints, there are a number of biological responses that have been associated with PM health effects including morphological changes and altered host defense mechanisms. The public health impact of these biological responses may be partly represented by our quantified endpoints.

[d] While some of the effects of short term exposures are likely to be captured in the estimates, there may be premature mortality due to short term exposure to PM not captured in the cohort study upon which the primary analysis is based.

[e] May result in benefits or disbenefits.

[f] These are potential effects as the literature is insufficient.

NMED Exhibit 7f

B. Paperwork Reduction Act

In compliance with the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*), EPA submitted a proposed Information Collection Request (ICR) (EPA ICR number 2512.01) to the OMB for review and approval on July 19, 2004 (FR 42720–42722). The ICR describes the nature of the information collection and its estimated burden and cost associated with the final rule. In cases where information is already collected by a related program, the ICR takes into account only the additional burden. This situation arises in States that are also subject to requirements of the Consolidated Emissions Reporting Rule (EPA ICR number 0916.10; OMB control number 2060–0088) or for sources that are subject to the Acid Rain Program (EPA ICR number 1633.13; OMB control number 2060–0258) or NO_X SIP Call (EPA ICR number 1857.03; OMB number 2060–0445) requirements.

The EPA solicited comments on specific aspects of the information collection. The purpose of the ICR is to estimate the anticipated monitoring, reporting, and recordkeeping burden estimates and associated costs for States, local governments, and sources that are expected to result from the CAIR.

The recordkeeping and reporting burden to sources resulting from States choosing to participate in a regional cap and trade program are expected to be less than $42 million annually at the time the monitors are implemented. This estimate includes the annualized cost of installing and operating appropriate SO_2 and NO_X emissions monitoring equipment to measure and report the total emissions of these pollutants from affected EGUs serving generators greater than 25 megawatt electrical. The burden to State and local air agencies includes any necessary SIP revisions, performing monitoring certification, and fulfilling audit responsibilities.

In accordance with the Paperwork Reduction Act, on July 19, 2004, an ICR was made available to the public for comment. The 60-day comment period expired September 19, 2004 with no public comments received specific to the ICR.

C. Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. § 601 et seq.)(RFA), as amended by the Small Business Regulatory Enforcement Fairness Act (Pub. L. 104–121)(SBREFA), provides that whenever an agency is required to publish a general notice of rulemaking, it must prepare and make available an initial regulatory flexibility analysis, unless it certifies that the rule, if promulgated, will not have ''a significant economic impact on a substantial number of small entities.'' 5 U.S.C. 605(b). Small entities include small businesses, small organizations, and small governmental jurisdictions.

For purposes of assessing the impacts of today's rule on small entities, small entity is defined as: (1) A small business that is identified by the North American Industry Classification System (NAICS) Code, as defined by the Small Business Administration (SBA); (2) a small governmental jurisdiction that is a government of a city, county, town, school district or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field. Table X–5 lists entities potentially impacted by this rule with applicable NAICS code.

X–5.—POTENTIALLY REGULATED CATEGORIES AND ENTITIES

Category	[1] NAICS code	Examples of potentially regulated entities
Industry	221112	Fossil fuel-fired electric utility steam generating units.
Federal government	[2] 221112	Fossil fuel-fired electric utility steam generating units owned by the Federal government.
State/local/Tribal government	[2] 221112	Fossil fuel-fired electric utility steam generating units owned by municipalities.
	921150	Fossil fuel-fired electric utility steam generating units in Indian Country.

[1] North American Industry Classification System.
[2] Federal, State, or local government-owned and operated establishments are classified according to the activity in which they are engaged.

According to the SBA size standards for NAICS code 221112 Utilities-Fossil Fuel Electric Power Generation, a firm is small if, including its affiliates, it is primarily engaged in the generation, transmission, and or distribution of electric energy for sale and its total electric output for the preceding fiscal year did not exceed 4 million megawatt hours.

Courts have interpreted the RFA to require a regulatory flexibility analysis only when small entities will be subject to the requirements of the rule. *See Michigan* v. *EPA*, 213 F.3d 663, 668–69 (DC Cir., 2000), *cert. den.* 121 S.Ct. 225, 149 L.Ed.2d 135 (2001).

This rule would not establish requirements applicable to small entities. Instead, it would require States to develop, adopt, and submit SIP revisions that would achieve the necessary SO_2 and NO_X emissions reductions, and would leave to the States the task of determining how to obtain those reductions, including which entities to regulate. Moreover, because affected States would have discretion to choose the sources to regulate and how much emissions reductions each selected source would have to achieve, EPA could not predict the effect of the rule on small entities. Although not required by the RFA, the Agency has conducted a small business analysis.

Overall, about 445 MW of total small entity capacity, or 1.0 percent of total small entity capacity in the CAIR region, is projected to be uneconomic to maintain under the CAIR relative to the base case. In practice, units projected to be uneconomic to maintain may be ''mothballed,'' retired, or kept in service to ensure transmission reliability in certain parts of the grid. Our IPM modeling is unable to distinguish between these potential outcomes.

The EPA modeling identified 264 small entities within the CAIR region based upon the definition of small entity outlined above. From this analysis, EPA excluded 189 small entities that were not projected to have at least one unit with a generating capacity of 25 MW or great operating in the base case. Thus, we found that 75 small entities may potentially be affected by the CAIR. Of these 75 small entities, 28 may experience compliance costs in excess of one percent of revenues in 2010, and 46 may in 2015, based on the Agency's assumptions of how the affected States implement control measures to meet their emissions budgets as set forth in this rulemaking. Potentially affected small entities experiencing compliance costs in excess of 1 percent of revenues have some potential for significant impact resulting from implementation of the CAIR. However, it is the Agency's position that because none of the affected entities currently operate in a competitive market environment, they should be able to pass the costs of complying with the CAIR on to rate-payers. Moreover, the decision to include only units greater than 25 MW in size exempts 185 small entities that would otherwise be potentially affected by the CAIR.

Two other points should be considered when evaluating the impact of the CAIR, specifically, and cap and trade programs more generally, on small entities. First, under the CAIR, the cap and trade program is designed such that States determine how NO_X allowances are to be allocated across units. A State that wishes to mitigate the impact of the rule on small entities might choose to allocate NO_X allowances in a manner that is favorable to small entities. Finally, the use of cap and trade in general will limit impacts on small entities relative to a less flexible command-and-control program.

D. Unfunded Mandates Reform Act

Title II of the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4) (UMRA), establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, and Tribal governments and the private sector. Under section 202 of the UMRA, 2 U.S.C. 1532, EPA generally must prepare a written statement, including a cost-benefit analysis, for any proposed or final rule that ''includes any Federal mandate that may result in the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more * * * in any one year.'' A ''Federal mandate'' is defined under section 421(6), 2 U.S.C. 658(6), to include a ''Federal intergovernmental mandate'' and a ''Federal private sector mandate.'' A ''Federal intergovernmental mandate,'' in turn, is defined to include a regulation that ''would impose an enforceable duty upon State, Local, or Tribal governments,'' section 421(5)(A)(i), 2 U.S.C. 658(5)(A)(i), except for, among other things, a duty that is ''a condition of Federal assistance,'' section 421(5)(A)(i)(I). A ''Federal private sector mandate'' includes a regulation that ''would impose an enforceable duty upon the private sector,'' with certain exceptions, section 421(7)(A), 2 U.S.C. 658(7)(A).

Before promulgating an EPA rule for which a written statement is needed under section 202 of the UMRA, section 205, 2 U.S.C. 1535, of the UMRA generally requires EPA to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, most cost-effective, or least burdensome alternative that achieves the objectives of the rule.

The EPA prepared a written statement for the final rule consistent with the requirements of section 202 of the UMRA. Furthermore, as EPA stated in the rule, EPA is not directly establishing any regulatory requirements that may significantly or uniquely affect small governments, including Tribal governments. Thus, EPA is not obligated to develop under section 203 of the UMRA a small government agency plan. Furthermore, in a manner consistent with the intergovernmental consultation provisions of section 204 of the UMRA, EPA carried out consultations with the governmental entities affected by this rule.

For several reasons, however, EPA is not reaching a final conclusion as to the applicability of the requirements of UMRA to this rulemaking action. First, it is questionable whether a requirement to submit a SIP revision would constitute a Federal mandate in any case. The obligation for a State to revise its SIP that arises out of section 110(a) of the CAA is not legally enforceable by a court of law, and at most is a condition for continued receipt of highway funds. Therefore, it is possible to view an action requiring such a submittal as not creating any enforceable duty within the meaning of section 421(5)(9a)(I) of UMRA (2 U.S.C. 658 (a)(I)). Even if it did, the duty could be viewed as falling within the exception for a condition of Federal assistance under section 421(5)(a)(i)(I) of UMRA (2 U.S.C. 658(5)(a)(i)(I)).

As noted earlier, however, notwithstanding these issues, EPA prepared for the final rule the statement that would be required by UMRA if its statutory provisions applied, and EPA has consulted with governmental entities as would be required by UMRA. Consequently, it is not necessary for EPA to reach a conclusion as to the applicability of the UMRA requirements.

The EPA conducted an analysis of the economic impacts anticipated from the CAIR for government-owned entities. The modeling conducted using the IPM projects that about 340 MW of municipality-owned capacity (about 0.4 percent of all subdivision, State and municipality capacity in the CAIR region) would be uneconomic to maintain under the CAIR, beyond what is projected in the base case. In practice, however, the units projected to be uneconomic to maintain may be 'mothballed,' retired, or kept in service to ensure transmission reliability in certain parts of the grid. For the most part, these units are small and infrequently used generating units that are dispersed throughout the CAIR region.

The EPA modeling identified 265 State or municipally-owned entities, as well as subdivisions, within the CAIR region. The EPA excluded from the analysis government-owned entities that were not projected to have at least one unit with generating capacity of 25 MW or greater in the base case. Thus, we excluded 184 entities from the analysis. We found that 81 government entities will be potentially affected by CAIR. Of the 81 government entities, 20 may experience compliance costs in excess of 1 percent of revenues in 2010, and 39 may in 2015, based on our assumptions of how the affected States implement control measures to meet their emissions budgets as set forth in this rulemaking.

Government entities projected to experience compliance costs in excess of 1 percent of revenues have some potential for significant impact resulting from implementation of the CAIR. However, as noted above, it is EPA's position that because these government entities can pass on their costs of compliance to rate-payers, they will not be significantly impacted. Furthermore, the decision to include only units greater than 25 MW in size exempts 179 government entities that would otherwise be potentially affected by the CAIR.

The above points aside, potentially adverse impacts of the CAIR on State and municipality-owned entities could be limited by the fact that the cap and trade program is designed such that States determine how NO_X allowances are to be allocated across units. A State that wishes to mitigate the impact of the rule on State or municipality-owned entities might choose to allocate NO_X allowances in a manner that is favorable to these entities. Finally, the use of cap and trade in general will limit impacts on entities owned by small governments relative to a less flexible command-and-control program.

E. Executive Order 13132: Federalism

Executive Order 13132, entitled ''Federalism'' (64 FR 43255, August 10, 1999), requires EPA to develop an accountable process to ensure ''meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications.'' ''Policies that have federalism implications'' is defined in the Executive Order to include

NMED Exhibit 7f

regulations that have ''substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.''

This rule does not have federalism implications. It will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, as specified in Executive Order 13132. The CAA establishes the relationship between the Federal Government and the States, and this rule does not impact that relationship. Thus, Executive Order 13132 does not apply to this rule. In the spirit of Executive Order 13132, and consistent with EPA policy to promote communications between EPA and State and local governments, EPA specifically solicited comment on this rule from State and local officials.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, entitled ''Consultation and Coordination with Indian Tribal Governments'' (65 FR 67249, November 9, 2000), requires EPA to develop an accountable process to ensure ''meaningful and timely input by Tribal officials in the development of regulatory policies that have Tribal implications.'' This rule does not have ''Tribal implications'' as specified in Executive Order 13175.

This rule addresses transport of pollution that are precurors for ozone and $PM_{2.5}$. The CAA provides for States and Tribes to develop plans to regulate emissions of air pollutants within their jurisdictions. The regulations clarify the statutory obligations of States and Tribes that develop plans to implement this rule. The Tribal Authority Rule (TAR) give Tribes the opportunity to develop and implement CAA programs, but it leaves to the discretion of the Tribe whether to develop these programs and which programs, or appropriate elements of a program, the Tribe will adopt.

This rule does not have Tribal implications as defined by Executive Order 13175. It does not have a substantial direct effect on one or more Indian Tribes, because no Tribe has implemented a federally-enforceable air quality management program under the CAA at this time. Furthermore, this rule does not affect the relationship or distribution of power and responsibilities between the Federal Government and Indian Tribes. The CAA and the TAR establish the relationship of the Federal Government and Tribes in developing plans to attain the NAAQS, and this rule does nothing to modify that relationship. Because this rule does not have Tribal implications, Executive Order 13175 does not apply.

If one assumes a Tribe is implementing a Tribal Implementation Plan, today's rule could have implications for that Tribe, but it would not impose substantial direct costs upon the Tribe, nor preempt Tribal law. As provided above, EPA has estimated that the total annual private costs for the rule for the CAIR region as implemented by State, local, and Tribal governments is approximately $2.4 billion in 2010 and $3.6 billion in 2015 (1999$). There are currently very few emissions sources in Indian country that could be affected by this rule and the percentage of Tribal land that will be impacted is very small. For Tribes that choose to regulate sources in Indian country, the costs would be attributed to inspecting regulated facilities and enforcing adopted regulations.

Although Executive Order 13175 does not apply to this rule, EPA consulted with Tribal officials in developing this rule. The EPA has encouraged Tribal input at an early stage. Also, EPA held periodic meetings with the States and the Tribes during the technical development of this rule. Three meetings were held with the Crow Tribe, where the Tribe expressed concerns about potential impacts of the rule on their coal mine operations. In addition, EPA held three calls with Tribal environmental professionals to address concerns specific to the Tribes. These discussions have given EPA valuable information about Tribal concerns regarding the development of this rule. The EPA has provided briefings for Tribal representatives and the newly formed National Tribal Air Association (NTAA), and other national Tribal forums. Input from Tribal representatives has been taken into consideration in development of this rule.

G. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

Executive Order 13045, ''Protection of Children from Environmental Health and Safety Risks'' (62 FR 19885, April 23, 1997) applies to any rule that (1) is determined to be ''economically significant'' as defined under Executive Order 12866, and (2) concerns an environmental health or safety risk that EPA has reason to believe may have a disproportionate effect on children. If the regulatory action meets both criteria, Section 5–501 of the Order directs the Agency to evaluate the environmental health or safety effects of the planned rule on children, and explain why the planned regulation is preferable to other potentially effective and reasonably feasible alternatives considered by the Agency.

This final rule is not subject to the Executive Order, because it does not involve decisions on environmental health or safety risks that may disproportionately affect children. The EPA believes that the emissions reductions from the strategies in this rule will further improve air quality and will further improve children's health.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

Executive Order 13211 (66 FR 28355, May 22, 2001) provides that agencies shall prepare and submit to the Administrator of the Office of Regulatory Affairs, OMB, a Statement of Energy Effects for certain actions identified as ''significant energy actions.'' Section 4(b) of Executive Order 13211 defines ''significant energy actions'' as ''any action by an agency (normally published in the **Federal Register**) that promulgates or is expected to lead to the promulgation of a final rule or regulation, including notices of inquiry, advance notices of final rulemaking, and notices of final rulemaking (1) (i) a significant regulatory action under Executive Order 12866 or any successor order, and (ii) likely to have a significant adverse effect on the supply, distribution, or use of energy; or (2) designated by the Administrator of the Office of Information and Regulatory Affairs as a ''significant energy action.'' This final rule is a significant regulatory action under Executive Order 12866, and this rule may have a significant adverse effect on the supply, distribution, or use of energy.

If States choose to obtain the emissions reductions required by this rule by regulating EGUs, EPA projects that approximately 5.3 GWs of coal-fired generation may be removed from operation by 2010. In practice, however, the units projected to be uneconomic to maintain may be 'mothballed,' retired, or kept in service to ensure transmission reliability in certain parts of the grid. For the most part, these units are small and infrequently used generating units that are dispersed throughout the CAIR region. Less conservative assumptions regarding natural gas prices or electricity demand would create a greater incentive to keep these units operational. The EPA projects that the

NMED Exhibit 7f

average annual electricity price will increase by less than 2.7 percent in the CAIR region and that natural gas prices will increase by less than 1.6 percent. The EPA does not believe that this rule will have any other impacts that exceed the significance criteria.

The EPA believes that a number of features of today's rulemaking serve to reduce its impact on energy supply. First, the optional trading program provides considerable flexibility to the power sector and enables industry to comply with the emission reduction requirements in the most cost-effective manner, thus minimizing overall costs and the ultimate impact on energy supply. The ability to use banked allowances from the existing title IV SO_2 trading program and the NO_X SIP Call Trading Program also provide additional flexibility. Second, the CAIR caps are set in two phases and provide adequate time for EGUs to install pollution controls. For more details concerning energy impacts, see the Regulatory Impact Analysis for the Final Clean Air Interstate Rule (March 2005).

I. National Technology Transfer Advancement Act

Section 12(d) of the National Technology Transfer and Advancement Act (NTTAA) of 1995 (Pub. L. 104–113; 15 U.S.C. 272 note) directs EPA to use voluntary consensus standards in its regulatory and procurement activities unless to do so would be inconsistent with applicable law or otherwise impractical. Voluntary consensus standards are technical standards (*e.g.*, materials specifications, test methods, sampling procedures, business practices) developed or adopted by one or more voluntary consensus bodies. The NTTAA directs EPA to provide Congress, through annual reports to OMB, with explanations when an agency does not use available and applicable voluntary consensus standards.

This rule would require all sources that participate in the trading program under part 96 to meet the applicable monitoring requirements of part 75. Part 75 already incorporates a number of voluntary consensus standards. Consistent with the Agency's Performance Based Measurement System (PBMS), part 75 sets forth performance criteria that allow the use of alternative methods to the ones set forth in part 75. The PBMS approach is intended to be more flexible and cost-effective for the regulated community; it is also intended to encourage innovation in analytical technology and improved data quality. At this time, EPA is not recommending any revisions to part 75; however, EPA periodically revises the test procedures set forth in part 75. When EPA revises the test procedures set forth in part 75 in the future, EPA will address the use of any new voluntary consensus standards that are equivalent. Currently, even if a test procedure is not set forth in part 75 EPA is not precluding the use of any method, whether it constitutes a voluntary consensus standard or not, as long as it meets the performance criteria specified; however, any alternative methods must be approved through the petition process under Sec. 75.66 before they are used under part 75.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

Executive Order 12898, ''Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations,'' requires Federal agencies to consider the impact of programs, policies, and activities on minority populations and low-income populations. According to EPA guidance,[179] agencies are to assess whether minority or low-income populations face risks or a rate of exposure to hazards that are significant and that ''appreciably exceed or is likely to appreciably exceed the risk or rate to the general population or to the appropriate comparison group.'' (EPA, 1998)

In accordance with Executive Order 12898, the Agency has considered whether this rule may have disproportionate negative impacts on minority or low income populations. The Agency expects this rule to lead to reductions in air pollution and exposures generally. For this reason, negative impacts to these sub-populations that appreciably exceed similar impacts to the general population are not expected.

K. Congressional Review Act

The Congressional Review Act, 5 U.S.C. 801 *et seq.*, as added by the Small Business Regulatory Enforcement Fairness Act of 1996, generally provides that before a rule may take effect, the agency promulgating the rule must submit a rule report, which includes a copy of the rule, to each House of the Congress and to the Comptroller General of the United States. The EPA will submit a report containing this rule and other required information to the U.S. Senate, the U.S. House of Representatives, and the Comptroller General of the United States prior to publication of the rule in the **Federal Register**. A Major rule cannot take effect until 60 days after it is published in the **Federal Register**. This action is a ''major rule'' as defined by 5 U.S.C. 804(2).

L. Judicial Review

Section 307(b)(1) of the CAA indicates which Federal Courts of Appeal have venue for petitions of review of final actions by EPA. This Section provides, in part, that petitions for review must be filed in the Court of Appeals for the District of Columbia Circuit if (i) the agency action consists of ''nationally applicable regulations promulgated, or final action taken, by the Administrator,'' or (ii) such action is locally or regionally applicable, if ''such action is based on a determination of nationwide scope or effect and if in taking such action the Administrator finds and publishes that such action is based on such a determination.''

Any final action related to CAIR is ''nationally applicable'' within the meaning of section 307(b)(1). As an initial matter, through this rule, EPA interprets section 110 of the CAA, a provision which has nationwide applicability. In addition, CAIR applies to 28 States and the District of Columbia. CAIR is also based on a common core of factual findings and analyses concerning the transport of pollutants between the different States subject to it. Finally, EPA has established uniform approvability criteria that would be applied to all States subject to CAIR. For these reasons, the Administrator also is determining that any final action regarding CAIR is of nationwide scope and effect for purposes of section 307(b)(1). Thus, any petitions for review of final actions regarding CAIR must be filed in the Court of Appeals for the District of Columbia Circuit within 60 days from the date final action is published in the **Federal Register**.

List of Subjects

40 CFR Part 51

Administrative practice and procedure, Air pollution control, Intergovernmental relations, Nitrogen oxides, Ozone, Particulate matter, Regional haze, Reporting and recordkeeping requirements, Sulfur dioxide.

40 CFR Parts 72, 73, 74, 77 and 78

Acid rain, Administrative practice and procedure, Air pollution control, Electric utilities, Intergovernmental

[179] U.S. Environmental Protection Agency, 1998. Guidance for Incorporating Environmental Justice Concerns in EPA's NEPA Compliance Analyses. Office of Federal Activities, Washington, DC, April, 1998.

NMED Exhibit 7f

relations, Nitrogen oxides, Reporting and recordkeeping requirements, Sulfur dioxide.

40 CFR Part 96

Administrative practice and procedure, Air pollution control, Electric utilities, Nitrogen oxides, Reporting and recordkeeping requirements, Sulfur dioxide.

Dated: March 10, 2005.

Stephen L. Johnson,

Acting Administrator.

■ Title 40, chapter I, of the Code of Federal Regulations is amended as follows:

PART 51—[AMENDED]

■ 1. The authority citation for Part 51 continues to read as follows:

Authority: 23 U.S.C. 101; 42 U.S.C. 7401–7671q.

§ 51.121 [Amended]

■ 2. Section 51.121 is amended by adding a new paragraph (r) to read as follows:

§ 51.121 Findings and requirements for submission of State implementation plan revisions relating to emissions of oxides of nitrogen.

* * * * *

(r)(1) Notwithstanding any provisions of paragraph (p) of this section, subparts A through I of part 96 of this chapter, and any State's SIP to the contrary, the Administrator will not carry out any of the functions set forth for the Administrator in subparts A through I of part 96 of this chapter, or in any emissions trading program in a State's SIP approved under paragraph (p) of this section, with regard to any ozone season that occurs after September 30, 2008.

(2) Except as provided in § 51.123(bb), a State whose SIP is approved as meeting the requirements of this section and that includes an emissions trading program approved under paragraph (p) of this section must revise the SIP to adopt control measures that satisfy the same portion of the State's NO_X emission reduction requirements under this section as the State projected such emissions trading program would satisfy.

■ 3. Revise § 51.122 of subpart G to read as follows:

§ 51.122 Emissions reporting requirements for SIP revisions relating to budgets for NO_X emissions.

(a) For its transport SIP revision under § 51.121, each State must submit to EPA NO_X emissions data as described in this section.

(b) Each revision must provide for periodic reporting by the State of NO_X emissions data to demonstrate whether the State's emissions are consistent with the projections contained in its approved SIP submission.

(1) Annual reporting. Each revision must provide for annual reporting of NO_X emissions data as follows:

(i) The State must report to EPA emissions data from all NO_X sources within the State for which the State specified control measures in its SIP submission under § 51.121(g) of this part. This would include all sources for which the State has adopted measures that differ from the measures incorporated into the baseline inventory for the year 2007 that the State developed in accordance with § 51.121(g).

(ii) If sources report NO_X emissions data to EPA annually pursuant to a trading program approved under § 51.121(p) or pursuant to the monitoring and reporting requirements of subpart H of 40 CFR part 75, then the State need not provide annual reporting to EPA for such sources.

(2) Triennial reporting. Each plan must provide for triennial (*i.e.*, every third year) reporting of NO_X emissions data from all sources within the State.

(3) The data availability requirements in § 51.116 must be followed for all data submitted to meet the requirements of paragraphs (b)(1) and (2) of this section.

(c) The data reported in paragraph (b) of this section for stationary point sources must meet the following minimum criteria:

(1) For annual data reporting purposes the data must include the following minimum elements:

(i) Inventory year.
(ii) State Federal Information Placement System code.
(iii) County Federal Information Placement System code.
(iv) Federal ID code (plant).
(v) Federal ID code (point).
(vi) Federal ID code (process).
(vii) Federal ID code (stack).
(viii) Site name.
(ix) Physical address.
(x) SCC.
(xi) Pollutant code.
(xii) Ozone season emissions.
(xiii) Area designation.

(2) In addition, the annual data must include the following minimum elements as applicable to the emissions estimation methodology.

(i) Fuel heat content (annual).
(ii) Fuel heat content (seasonal).
(iii) Source of fuel heat content data.
(iv) Activity throughput (annual).
(v) Activity throughput (seasonal).
(vi) Source of activity/throughput data.
(vii) Spring throughput (%).
(viii) Summer throughput (%).
(ix) Fall throughput (%).
(x) Work weekday emissions.
(xi) Emission factor.
(xii) Source of emission factor.
(xiii) Hour/day in operation.
(xiv) Operations Start time (hour).
(xv) Day/week in operation.
(xvi) Week/year in operation.

(3) The triennial inventories must include the following data elements:

(i) The data required in paragraphs (c)(1) and (c)(2) of this section.
(ii) X coordinate (longitude).
(iii) Y coordinate (latitude).
(iv) Stack height.
(v) Stack diameter.
(vi) Exit gas temperature.
(vii) Exit gas velocity.
(viii) Exit gas flow rate.
(ix) SIC.
(x) Boiler/process throughput design capacity.
(xi) Maximum design rate.
(xii) Maximum capacity.
(xiii) Primary control efficiency.
(xiv) Secondary control efficiency.
(xv) Control device type.

(d) The data reported in paragraph (b) of this section for non-point sources must include the following minimum elements:

(1) For annual inventories it must include:

(i) Inventory year.
(ii) State FIPS code.
(iii) County FIPS code.
(iv) SCC.
(v) Emission factor.
(vi) Source of emission factor.
(vii) Activity/throughput level (annual).
(viii) Activity throughput level (seasonal).
(ix) Source of activity/throughput data.
(x) Spring throughput (%).
(xi) Summer throughput (%).
(xii) Fall throughput (%).
(xiii) Control efficiency (%).
(xiv) Pollutant code.
(xv) Ozone season emissions.
(xvi) Source of emissions data.
(xvii) Hour/day in operation.
(xviii) Day/week in operation.
(xix) Week/year in operations.

(2) The triennial inventories must contain, at a minimum, all the data required in paragraph (d)(1) of this section.

(e) The data reported in paragraph (b) of this section for mobile sources must meet the following minimum criteria:

(1) For the annual and triennial inventory purposes, the following data must be reported:

(i) Inventory year.
(ii) State FIPS code.

NMED Exhibit 7f

(iii) County FIPS code.
(iv) SCC.
(v) Emission factor.
(vi) Source of emission factor.
(vii) Activity (this must be reported for both highway and nonroad activity. Submit nonroad activity in the form of hours of activity at standard load (either full load or average load) for each engine type, application, and horsepower range. Submit highway activity in the form of vehicle miles traveled (VMT) by vehicle class on each roadway type. Report both highway and nonroad activity for a typical ozone season weekday day, if the State uses EPA's default weekday/weekend activity ratio. If the State uses a different weekday/weekend activity ratio, submit separate activity level information for weekday days and weekend days.)
(viii) Source of activity data.
(ix) Pollutant code.
(x) Summer work weekday emissions.
(xi) Ozone season emissions.
(xii) Source of emissions data.
(2) [Reserved.]

(f) Approval of ozone season calculation by EPA. Each State must submit for EPA approval an example of the calculation procedure used to calculate ozone season emissions along with sufficient information for EPA to verify the calculated value of ozone season emissions.

(g) *Reporting schedules.* (1) Data collection is to begin during the ozone season one year prior to the State's NO_X SIP Call compliance date.

(2) Reports are to be submitted according to paragraph (b) of this section and the schedule in Table 1. After 2008, trienniel reports are to be submitted every third year and annual reports are to be submitted each year that a trienniel report is not required.

TABLE 1.—SCHEDULE FOR SUBMITTING REPORTS

Data collection year	Type of report required
2002	Trienniel.
2003	Annual.
2004	Annual.
2005	Trienniel.
2006	Annual.
2007	Annual.
2008	Trienniel.

(3) States must submit data for a required year no later than 12 months after the end of the calendar year for which the data are collected.

(h) *Data Reporting Procedures.* When submitting a formal NO_X budget emissions report and associated data, States shall notify the appropriate EPA Regional Office.

(1) States are required to report emissions data in an electronic format to EPA. Several options are available for data reporting. States can obtain information on the current formats at the following Internet address: *http://www.epa.gov/ttn/chief,* by calling the EPA Info CHIEF help desk at (919) 541–1000 or by sending an e-mail to *info.chief@epa.gov.* Because electronic reporting technology continually changes, States are to contact the Emission Inventory Group (EIG) for the latest specific formats.

(2) For annual reporting (not for triennial reports), a State may have sources submit the data directly to EPA to the extent the sources are subject to a trading program that qualifies for approval under § 51.121(q), and the State has agreed to accept data in this format. The EPA will make both the raw data submitted in this format and summary data available to any State that chooses this option.

(i) *Definitions.* As used in this section, the following words and terms shall have the meanings set forth below:

(1) *Annual emissions.* Actual emissions for a plant, point, or process, either measured or calculated.

(2) *Ash content.* Inert residual portion of a fuel.

(3) *Area designation.* The designation of the area in which the reporting source is located with regard to the ozone NAAQS. This would include attainment or nonattainment designations. For nonattainment designations, the classification of the nonattainment area must be specified, *i.e.*, transitional, marginal, moderate, serious, severe, or extreme.

(4) *Boiler design capacity.* A measure of the size of a boiler, based on the reported maximum continuous steam flow. Capacity is calculated in units of MMBtu/hr.

(5) *Control device type.* The name of the type of control device (*e.g.*, wet scrubber, flaring, or process change).

(6) *Control efficiency.* The emissions reduction efficiency of a primary control device, which shows the amount of reductions of a particular pollutant from a process's emissions due to controls or material change. Control efficiency is usually expressed as a percentage or in tenths.

(7) *Day/week in operations.* Days per week that the emitting process operates.

(8) *Emission factor.* Ratio relating emissions of a specific pollutant to an activity or material throughput level.

(9) *Exit gas flow rate.* Numeric value of stack gas flow rate.

(10) *Exit gas temperature.* Numeric value of an exit gas stream temperature.

(11) *Exit gas velocity.* Numeric value of an exit gas stream velocity.

(12) *Fall throughput (%).* Portion of throughput for the 3 fall months (September, October, November). This represents the expression of annual activity information on the basis of four seasons, typically spring, summer, fall, and winter. It can be represented either as a percentage of the annual activity (*e.g.*, production in summer is 40 percent of the year's production), or in terms of the units of the activity (*e.g.*, out of 600 units produced, spring = 150 units, summer = 250 units, fall = 150 units, and winter = 50 units).

(13) *Federal ID code (plant).* Unique codes for a plant or facility, containing one or more pollutant-emitting sources.

(14) *Federal ID code (point).* Unique codes for the point of generation of emissions, typically a physical piece of equipment.

(15) *Federal ID code (stack number).* Unique codes for the point where emissions from one or more processes are released into the atmosphere.

(16) *Federal Information Placement System (FIPS).* The system of unique numeric codes developed by the government to identify States, counties, towns, and townships for the entire United States, Puerto Rico, and Guam.

(17) *Heat content.* The thermal heat energy content of a solid, liquid, or gaseous fuel. Fuel heat content is typically expressed in units of Btu/lb of fuel, Btu/gal of fuel, joules/kg of fuel, etc.

(18) *Hr/day in operations.* Hours per day that the emitting process operates.

(19) *Maximum design rate.* Maximum fuel use rate based on the equipment's or process' physical size or operational capabilities.

(20) *Maximum nameplate capacity.* A measure of the size of a generator which is put on the unit's nameplate by the manufacturer. The data element is reported in megawatts (MW) or kilowatts (KW).

(21) *Mobile source.* A motor vehicle, nonroad engine or nonroad vehicle, where:

(i) Motor vehicle means any self-propelled vehicle designed for transporting persons or property on a street or highway;

(ii) Nonroad engine means an internal combustion engine (including the fuel system) that is not used in a motor vehicle or a vehicle used solely for competition, or that is not subject to standards promulgated under section 111 or section 202 of the CAA;

(iii) Nonroad vehicle means a vehicle that is powered by a nonroad engine and that is not a motor vehicle or a vehicle used solely for competition.

(22) *Ozone season.* The period May 1 through September 30 of a year.

(23) *Physical address.* Street address of facility.

(24) *Point source.* A non-mobile source which emits 100 tons of NO_X or more per year unless the State designates as a point source a non-mobile source emitting at a specified level lower than 100 tons of NO_X per year. A non-mobile source which emits less NO_X per year than the point source threshold is a non-point source.

(25) *Pollutant code.* A unique code for each reported pollutant that has been assigned in the EIIP Data Model. Character names are used for criteria pollutants, while Chemical Abstracts Service (CAS) numbers are used for all other pollutants. Some States may be using storage and retrieval of aerometric data (SAROAD) codes for pollutants, but these should be able to be mapped to the EIIP Data Model pollutant codes.

(26) *Process rate/throughput.* A measurable factor or parameter that is directly or indirectly related to the emissions of an air pollution source. Depending on the type of source category, activity information may refer to the amount of fuel combusted, the amount of a raw material processed, the amount of a product that is manufactured, the amount of a material that is handled or processed, population, employment, number of units, or miles traveled. Activity information is typically the value that is multiplied against an emission factor to generate an emissions estimate.

(27) *SCC.* Source category code. A process-level code that describes the equipment or operation emitting pollutants.

(28) *Secondary control efficiency (%).* The emissions reductions efficiency of a secondary control device, which shows the amount of reductions of a particular pollutant from a process' emissions due to controls or material change. Control efficiency is usually expressed as a percentage or in tenths.

(29) *SIC.* Standard Industrial Classification code. U.S. Department of Commerce's categorization of businesses by their products or services.

(30) *Site name.* The name of the facility.

(31) *Spring throughput (%).* Portion of throughput or activity for the 3 spring months (March, April, May). See the definition of Fall Throughput.

(32) *Stack diameter.* Stack physical diameter.

(33) *Stack height.* Stack physical height above the surrounding terrain.

(34) *Start date (inventory year).* The calendar year that the emissions estimates were calculated for and are applicable to.

(35) *Start time (hour).* Start time (if available) that was applicable and used for calculations of emissions estimates.

(36) *Summer throughput (%).* Portion of throughput or activity for the 3 summer months (June, July, August). See the definition of Fall Throughput.

(37) *Summer work weekday emissions.* Average day's emissions for a typical day.

(38) *VMT by Roadway Class.* This is an expression of vehicle activity that is used with emission factors. The emission factors are usually expressed in terms of grams per mile of travel. Since VMT does not directly correlate to emissions that occur while the vehicle is not moving, these non-moving emissions are incorporated into EPA's MOBILE model emission factors.

(39) *Week/year in operation.* Weeks per year that the emitting process operates.

(40) *Work Weekday.* Any day of the week except Saturday or Sunday.

(41) *X coordinate (longitude).* An object's east-west geographical coordinate.

(42) *Y coordinate (latitude).* An object's north-south geographical coordinate.

■ 4. Part 51 is amended by adding § 51.123 to Subpart G to read as follows:

§ 51.123 Findings and requirements for submission of State implementation plan revisions relating to emissions of oxides of nitrogen pursuant to the Clean Air Interstate Rule.

(a)(1) Under section 110(a)(1) of the CAA, 42 U.S.C. 7410(a)(1), the Administrator determines that each State identified in paragraph (c)(1) and (2) of this section must submit a SIP revision to comply with the requirements of section 110(a)(2)(D)(i)(I) of the CAA, 42 U.S.C. 7410(a)(2)(D)(i)(I), through the adoption of adequate provisions prohibiting sources and other activities from emitting NO_X in amounts that will contribute significantly to nonattainment in, or interfere with maintenance by, one or more other States with respect to the fine particles ($PM_{2.5}$) NAAQS.

(2)(a) Under section 110(a)(1) of the CAA, 42 U.S.C. 7410(a)(1), the Administrator determines that each State identified in paragraph (c)(1) and (3) of this section must submit a SIP revision to comply with the requirements of section 110(a)(2)(D)(i)(I) of the CAA, 42 U.S.C. 7410(a)(2)(D)(i)(I), through the adoption of adequate provisions prohibiting sources and other activities from emitting NO_X in amounts that will contribute significantly to nonattainment in, or interfere with maintenance by, one or more other States with respect to the 8-hour ozone NAAQS.

(b) For each State identified in paragraph (c) of this section, the SIP revision required under paragraph (a) of this section will contain adequate provisions, for purposes of complying with section 110(a)(2)(D)(i)(I) of the CAA, 42 U.S.C. 7410(a)(2)(D)(i)(I), only if the SIP revision contains control measures that assure compliance with the applicable requirements of this section.

(c) In addition to being subject to the requirements in paragraphs (b) and (d) of this section:

(1) Alabama, Florida, Illinois, Indiana, Iowa, Kentucky, Louisiana, Maryland, Michigan, Mississippi, Missouri, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Virginia, West Virginia, Wisconsin, and the District of Columbia shall be subject to the requirements contained in paragraphs (e) through (cc) of this section;

(2) Georgia, Minnesota, and Texas shall be subject to the requirements in paragraphs (e) through (o) and (cc) of this section; and

(3) Arkansas, Connecticut, Delaware, Massachusetts, and New Jersey shall be subject to the requirements contained in paragraphs (q) through (cc) of this section.

(d)(1) The State's SIP revision under paragraph (a) of this section must be submitted to EPA by no later than September 11, 2006.

(2) The requirements of appendix V to this part shall apply to the SIP revision under paragraph (a) of this section.

(3) The State shall deliver 5 copies of the SIP revision under paragraph (a) of this section to the appropriate Regional Office, with a letter giving notice of such action.

(e) The State's SIP revision shall contain control measures and demonstrate that they will result in compliance with the State's Annual EGU NO_X Budget, if applicable, and achieve the State's Annual Non-EGU NO_X Reduction Requirement, if applicable, for the appropriate periods. The amounts of the State's Annual EGU NO_X Budget and Annual Non-EGU NO_X Reduction Requirement shall be determined as follows:

(1)(i) The Annual EGU NO_X Budget for the State is defined as the total amount of NO_X emissions from all EGUs in that State for a year, if the State meets the requirements of paragraph (a)(1) of this section by imposing control measures, at least in part, on EGUs. If the State imposes control measures

NMED Exhibit 7f

under this section on only EGUs, the Annual EGU NO_X Budget for the State shall not exceed the amount, during the indicated periods, specified in paragraph (e)(2) of this section.

(ii) The Annual Non-EGU NO_X Reduction Requirement, if applicable, is defined as the total amount of NO_X emission reductions that the State demonstrates, in accordance with paragraph (g) of this section, it will achieve from non-EGUs during the appropriate period. If the State meets the requirements of paragraph (a)(1) of this section by imposing control measures on only non-EGUs, then the State's Annual Non-EGU NO_X Reduction Requirement shall equal or exceed, during the appropriate periods, the amount determined in accordance with paragraph (e)(3) of this section.

(iii) If a State meets the requirements of paragraph (a)(1) of this section by imposing control measures on both EGUs and non-EGUs, then:

(A) The Annual Non-EGU NO_X Reduction Requirement shall equal or exceed the difference between the amount specified in paragraph (e)(2) of this section for the appropriate period and the amount of the State's Annual EGU NO_X Budget specified in the SIP revision for the appropriate period; and

(B) The Annual EGU NO_X Budget shall not exceed, during the indicated periods, the amount specified in paragraph (e)(2) of this section plus the amount of the Annual Non-EGU NO_X Reduction Requirement under paragraph (e)(1)(iii)(A) of this section for the appropriate period.

(2) For a State that complies with the requirements of paragraph (a)(1) of this section by imposing control measures on only EGUs, the amount of the Annual EGU NO_X Budget, in tons of NO_X per year, shall be as follows, for the indicated State for the indicated period:

State	Annual EGU NO_X budget for 2009–2014 (tons)	Annual EGU NO_X budget for 2015 and thereafter (tons)
Alabama	69,020	57,517
District of Columbia	144	120
Florida	99,445	82,871
Georgia	66,321	55,268
Illinois	76,230	63,525
Indiana	108,935	90,779
Iowa	32,692	27,243
Kentucky	83,205	69,337
Louisiana	35,512	29,593
Maryland	27,724	23,104
Michigan	65,304	54,420
Minnesota	31,443	26,203
Mississippi	17,807	14,839
Missouri	59,871	49,892
New York	45,617	38,014
North Carolina	62,183	51,819
Ohio	108,667	90,556
Pennsylvania	99,049	82,541
South Carolina	32,662	27,219
Tennessee	50,973	42,478
Texas	181,014	150,845
Virginia	36,074	30,062
West Virginia	74,220	61,850
Wisconsin	40,759	33,966

(3) For a State that complies with the requirements of paragraph (a)(1) of this section by imposing control measures on only non-EGUs, the amount of the Annual Non-EGU NO_X Reduction Requirement, in tons of NO_X per year, shall be determined, for the State for 2009 and thereafter, by subtracting the amount of the State's Annual EGU NO_X Budget for the appropriate year, specified in paragraph (e)(2) of this section from the amount of the State's NO_X baseline EGU emissions inventory projected for the appropriate year, specified in Table 5 of ''Regional and State SO_2 and NO_X Budgets'', March 2005 (available at *http://www.epa.gov/cleanairinterstaterule*).

(4)(i) Notwithstanding the State's obligation to comply with paragraph (e)(2) or (3) of this section, the State's SIP revision may allow sources required by the revision to implement control measures to demonstrate compliance using credit issued from the State's compliance supplement pool, as set forth in paragraph (e)(4)(ii) of this section.

(ii) The State-by-State amounts of the compliance supplement pool are as follows:

State	Compliance supplement pool
Alabama	10,166
District of Columbia	0
Florida	8,335
Georgia	12,397
Illinois	11,299
Indiana	20,155
Iowa	6,978
Kentucky	14,935
Louisiana	2,251
Maryland	4,670
Michigan	8,347
Minnesota	6,528
Mississippi	3,066
Missouri	9,044
New York	0
North Carolina	0
Ohio	25,037
Pennsylvania	16,009
South Carolina	2,600
Tennessee	8,944
Texas	772
Virginia	5,134
West Virginia	16,929
Wisconsin	4,898

(iii) The SIP revision may provide for the distribution of credits from the compliance supplement pool to sources

NMED Exhibit 7f

that are required to implement control measures using one or both of the following two mechanisms:

(A) The State may issue credit from compliance supplement pool to sources that are required by the SIP revision to implement NO_X emission control measures and that implement NO_X emission reductions in 2007 and 2008 that are not necessary to comply with any State or federal emissions limitation applicable at any time during such years. Such a source may be issued one credit from the compliance supplement pool for each ton of such emission reductions in 2007 and 2008.

(1) The State shall complete the issuance process by January 1, 2010.

(2) The emissions reductions for which credits are issued must have been demonstrated by the owners and operators of the source to have occurred during 2007 and 2008 and not to be necessary to comply with any applicable State or federal emissions limitation.

(3) The emissions reductions for which credits are issued must have been quantified by the owners and operators of the source:

(i) For EGUs and for fossil-fuel-fired non-EGUs that are boilers or combustion turbines with a maximum design heat input greater than 250 mmBut/hr, using emissions data determined in accordance with subpart H of part 75 of this chapter; and

(ii) For non-EGUs not described in paragraph (e)(4)(iii)(A)(3)(i) of this section, using emissions data determined in accordance with subpart H of part 75 of this chapter or, if the State demonstrates that compliance with subpart H of part 75 of this chapter is not practicable, determined, to the extent practicable, with the same degree of assurance with which emissions data are determined for sources subject to subpart H of part 75.

(4) If the SIP revision contains approved provisions for an emissions trading program, the owners and operators of sources that receive credit according to the requirements of this paragraph may transfer the credit to other sources or persons according to the provisions in the emissions trading program.

(B) The State may issue credit from the compliance supplement pool to sources that are required by the SIP revision to implement NO_X emission control measures and whose owners and operators demonstrate a need for an extension, beyond 2009, of the deadline for the source for implementing such emission controls.

(1) The State shall complete the issuance process by January 1, 2010.

(2) The State shall issue credit to a source only if the owners and operators of the source demonstrate that:

(i) For a source used to generate electricity, implementation of the SIP revision's applicable control measures by 2009 would create undue risk for the reliability of the electricity supply. This demonstration must include a showing that it would not be feasible for the owners and operators of the source to obtain a sufficient amount of electricity, to prevent such undue risk, from other electricity generation facilities during the installation of control technology at the source necessary to comply with the SIP revision.

(ii) For a source not used to generate electricity, compliance with the SIP revision's applicable control measures by 2009 would create undue risk for the source or its associated industry to a degree that is comparable to the risk described in paragraph (e)(4)(iii)(B)(2)(i) of this section.

(iii) This demonstration must include a showing that it would not be possible for the source to comply with applicable control measures by obtaining sufficient credits under paragraph (e)(4)(iii)(A) of this section, or by acquiring sufficient credits from other sources or persons, to prevent undue risk.

(f) Each SIP revision must set forth control measures to meet the amounts specified in paragraph (e) of this section, as applicable, including the following:

(1) A description of enforcement methods including, but not limited to:

(i) Procedures for monitoring compliance with each of the selected control measures;

(ii) Procedures for handling violations; and

(iii) A designation of agency responsibility for enforcement of implementation.

(2)(i) If a State elects to impose control measures on EGUs, then those measures must impose an annual NO_X mass emissions cap on all such sources in the State.

(ii) If a State elects to impose control measures on fossil fuel-fired non-EGUs that are boilers or combustion turbines with a maximum design heat input greater than 250 mmBtu/hr, then those measures must impose an annual NO_X mass emissions cap on all such sources in the State.

(iii) If a State elects to impose control measures on non-EGUs other than those described in paragraph (f)(2)(ii) of this section, then those measures must impose an annual NO_X mass emissions cap on all such sources in the State or the State must demonstrate why such emissions cap is not practicable and adopt alternative requirements that ensure that the State will comply with its requirements under paragraph (e) of this section, as applicable, in 2009 and subsequent years.

(g)(1) Each SIP revision that contains control measures covering non-EGUs as part or all of a State's obligation in meeting its requirement under paragraph (a)(1) of this section must demonstrate that such control measures are adequate to provide for the timely compliance with the State's Annual Non-EGU NO_X Reduction Requirement under paragraph (e) of this section and are not adopted or implemented by the State, as of May 12, 2005, and are not adopted or implemented by the Federal government, as of the date of submission of the SIP revision by the State to EPA.

(2) The demonstration under paragraph (g)(1) of this section must include the following, with respect to each source category of non-EGUs for which the SIP revision requires control measures:

(i) A detailed historical baseline inventory of NO_X mass emissions from the source category in a representative year consisting, at the State's election, of 2002, 2003, 2004, or 2005, or an average of 2 or more of those years, absent the control measures specified in the SIP revision.

(A) This inventory must represent estimates of actual emissions based on monitoring data in accordance with subpart H of part 75 of this chapter, if the source category is subject to monitoring requirements in accordance with subpart H of part 75 of this chapter.

(B) In the absence of monitoring data in accordance with subpart H of part 75 of this chapter, actual emissions must be quantified, to the maximum extent practicable, with the same degree of assurance with which emissions are quantified for sources subject to subpart H of part 75 of this chapter and using source-specific or source-category-specific assumptions that ensure a source's or source category's actual emissions are not overestimated. If a State uses factors to estimate emissions, production or utilization, or effectiveness of controls or rules for a source category, such factors must be chosen to ensure that emissions are not overestimated.

(C) For measures to reduce emissions from motor vehicles, emission estimates must be based on an emissions model that has been approved by EPA for use in SIP development and must be consistent with the planning assumptions regarding vehicle miles

NMED Exhibit 7f

traveled and other factors current at the time of the SIP development.

(D) For measures to reduce emissions from nonroad engines or vehicles, emission estimates methodologies must be approved by EPA.

(ii) A detailed baseline inventory of NO_X mass emissions from the source category in the years 2009 and 2015, absent the control measures specified in the SIP revision and reflecting changes in these emissions from the historical baseline year to the years 2009 and 2015, based on projected changes in the production input or output, population, vehicle miles traveled, economic activity, or other factors as applicable to this source category.

(A) These inventories must account for implementation of any control measures that are otherwise required by final rules already promulgated, as of May 12, 2005, or adopted or implemented by any federal agency, as of the date of submission of the SIP revision by the State to EPA, and must exclude any control measures specified in the SIP revision to meet the NO_X emissions reduction requirements of this section.

(B) Economic and population forecasts must be as specific as possible to the applicable industry, State, and county of the source or source category and must be consistent with both national projections and relevant official planning assumptions, including estimates of population and vehicle miles traveled developed through consultation between State and local transportation and air quality agencies. However, if these official planning assumptions are inconsistent with official U.S. Census projections of population or with energy consumption projections contained in the U.S. Department of Energy's most recent Annual Energy Outlook, then the SIP revision must make adjustments to correct the inconsistency or must demonstrate how the official planning assumptions are more accurate.

(C) These inventories must account for any changes in production method, materials, fuels, or efficiency that are expected to occur between the historical baseline year and 2009 or 2015, as appropriate.

(iii) A projection of NO_X mass emissions in 2009 and 2015 from the source category assuming the same projected changes as under paragraph (g)(2)(ii) of this section and resulting from implementation of each of the control measures specified in the SIP revision.

(A) These inventories must address the possibility that the State's new control measures may cause production or utilization, and emissions, to shift to unregulated or less stringently regulated sources in the source category in the same or another State, and these inventories must include any such amounts of emissions that may shift to such other sources.

(B) The State must provide EPA with a summary of the computations, assumptions, and judgments used to determine the degree of reduction in projected 2009 and 2015 NO_X emissions that will be achieved from the implementation of the new control measures compared to the relevant baseline emissions inventory.

(iv) The result of subtracting the amounts in paragraph (g)(2)(iii) of this section for 2009 and 2015, respectively, from the lower of the amounts in paragraph (g)(2)(i) or (g)(2)(ii) of this section for 2009 and 2015, respectively, may be credited towards the State's Annual Non-EGU NO_X Reduction Requirement in paragraph (e)(3) of this section for the appropriate period.

(v) Each SIP revision must identify the sources of the data used in each estimate and each projection of emissions.

(h) Each SIP revision must comply with § 51.116 (regarding data availability).

(i) Each SIP revision must provide for monitoring the status of compliance with any control measures adopted to meet the State's requirements under paragraph (e) of this section as follows:

(1) The SIP revision must provide for legally enforceable procedures for requiring owners or operators of stationary sources to maintain records of, and periodically report to the State:

(i) Information on the amount of NO_X emissions from the stationary sources; and

(ii) Other information as may be necessary to enable the State to determine whether the sources are in compliance with applicable portions of the control measures;

(2) The SIP revision must comply with § 51.212 (regarding testing, inspection, enforcement, and complaints);

(3) If the SIP revision contains any transportation control measures, then the SIP revision must comply with § 51.213 (regarding transportation control measures);

(4)(i) If the SIP revision contains measures to control EGUs, then the SIP revision must require such sources to comply with the monitoring, recordkeeping, and reporting provisions of subpart H of part 75 of this chapter.

(ii) If the SIP revision contains measures to control fossil fuel-fired non-EGUs that are boilers or combustion turbines with a maximum design heat input greater than 250 mmBtu/hr, then the SIP revision must require such sources to comply with the monitoring, recordkeeping, and reporting provisions of subpart H of part 75 of this chapter.

(iii) If the SIP revision contains measures to control any other non-EGUs that are not described in paragraph (i)(4)(ii) of this section, then the SIP revision must require such sources to comply with the monitoring, recordkeeping, and reporting provisions of subpart H of part 75 of this chapter, or the State must demonstrate why such requirements are not practicable and adopt alternative requirements that ensure that the required emissions reductions will be quantified, to the maximum extent practicable, with the same degree of assurance with which emissions are quantified for sources subject to subpart H of part 75 of this chapter.

(j) Each SIP revision must show that the State has legal authority to carry out the SIP revision, including authority to:

(1) Adopt emissions standards and limitations and any other measures necessary for attainment and maintenance of the State's relevant Annual EGU NO_X Budget or the Annual Non-EGU NO_X Reduction Requirement, as applicable, under paragraph (e) of this section;

(2) Enforce applicable laws, regulations, and standards and seek injunctive relief;

(3) Obtain information necessary to determine whether air pollution sources are in compliance with applicable laws, regulations, and standards, including authority to require recordkeeping and to make inspections and conduct tests of air pollution sources; and

(4)(i) Require owners or operators of stationary sources to install, maintain, and use emissions monitoring devices and to make periodic reports to the State on the nature and amounts of emissions from such stationary sources; and

(ii) Make the data described in paragraph (j)(4)(i) of this section available to the public within a reasonable time after being reported and as correlated with any applicable emissions standards or limitations.

(k)(1) The provisions of law or regulation that the State determines provide the authorities required under this section must be specifically identified, and copies of such laws or regulations must be submitted with the SIP revision.

(2) Legal authority adequate to fulfill the requirements of paragraphs (j)(3) and (4) of this section may be delegated to the State under section 114 of the CAA.

NMED Exhibit 7f

(l)(1) A SIP revision may assign legal authority to local agencies in accordance with § 51.232.

(2) Each SIP revision must comply with § 51.240 (regarding general plan requirements).

(m) Each SIP revision must comply with § 51.280 (regarding resources).

(n) Each SIP revision must provide for State compliance with the reporting requirements in § 51.125.

(o)(1) Notwithstanding any other provision of this section, if a State adopts regulations substantively identical to subparts AA through II of part 96 of this chapter (CAIR NO_X Annual Trading Program), incorporates such subparts by reference into its regulations, or adopts regulations that differ substantively from such subparts only as set forth in paragraph (o)(2) of this section, then such emissions trading program in the State's SIP revision is automatically approved as meeting the requirements of paragraph (e) of this section, provided that the State has the legal authority to take such action and to implement its responsibilities under such regulations.

(2) If a State adopts an emissions trading program that differs substantively from subparts AA through II of part 96 of this chapter only as follows, then the emissions trading program is approved as set forth in paragraph (o)(1) of this section.

(i) The State may decline to adopt the CAIR NO_X opt-in provisions of:

(A) Subpart II of this part and the provisions applicable only to CAIR NO_X opt-in units in subparts AA through HH of this part;

(B) Section 96.188(b) of this chapter and the provisions of subpart II of this part applicable only to CAIR NO_X opt-in units under § 96.188(b); or

(C) Section 96.188(c) of this chapter and the provisions of subpart II of this part applicable only to CAIR NO_X opt-in units under § 96.188(c).

(ii) The State may decline to adopt the allocation provisions set forth in subpart EE of part 96 of this chapter and may instead adopt any methodology for allocating CAIR NO_X allowances to individual sources, as follows:

(A) The State's methodology must not allow the State to allocate CAIR NO_X allowances for a year in excess of the amount in the State's Annual EGU NO_X Budget for such year;

(B) The State's methodology must require that, for EGUs commencing operation before January 1, 2001, the State will determine, and notify the Administrator of, each unit's allocation of CAIR NO_X allowances by October 31, 2006 for 2009, 2010, and 2011 and by October 31, 2008 and October 31 of each year thereafter for the year after the year of the notification deadline; and

(C) The State's methodology must require that, for EGUs commencing operation on or after January 1, 2001, the State will determine, and notify the Administrator of, each unit's allocation of CAIR NO_X allowances by October 31 of the year for which the CAIR NO_X allowances are allocated.

(3) A State that adopts an emissions trading program in accordance with paragraph (o)(1) or (2) of this section is not required to adopt an emissions trading program in accordance with paragraph (aa)(1) or (2) of this section or § 96.124(o)(1) or (2).

(4) If a State adopts an emissions trading program that differs substantively from subparts AA through HH of part 96 of this chapter, other than as set forth in paragraph (o)(2) of this section, then such emissions trading program is not automatically approved as set forth in paragraph (o)(1) or (2) of this section and will be reviewed by the Administrator for approvability in accordance with the other provisions of this section, provided that the NO_X allowances issued under such emissions trading program shall not, and the SIP revision shall state that such NO_X allowances shall not, qualify as CAIR NO_X allowances or CAIR NO_X Ozone Season allowances under any emissions trading program approved under paragraphs (o)(1) or (2) or (aa)(1) or (2) of this section.

(p) [Reserved]

(q) The State's SIP revision shall contain control measures and demonstrate that they will result in compliance with the State's Ozone Season EGU NO_X Budget, if applicable, and achieve the State's Ozone Season Non-EGU NO_X Reduction Requirement, if applicable, for the appropriate periods. The amounts of the State's Ozone Season EGU NO_X Budget and Ozone Season Non-EGU NO_X Reduction Requirement shall be determined as follows:

(1)(i) The Ozone Season EGU NO_X Budget for the State is defined as the total amount of NO_X emissions from all EGUs in that State for an ozone season, if the State meets the requirements of paragraph (a)(2) of this section by imposing control measures, at least in part, on EGUs. If the State imposes control measures under this section on only EGUs, the Ozone Season EGU NO_X Budget for the State shall not exceed the amount, during the indicated periods, specified in paragraph (q)(2) of this section.

(ii) The Ozone Season Non-EGU NO_X Reduction Requirement, if applicable, is defined as the total amount of NO_X emission reductions that the State demonstrates, in accordance with paragraph (s) of this section, it will achieve from non-EGUs during the appropriate period. If the State meets the requirements of paragraph (a)(2) of this section by imposing control measures on only non-EGUs, then the State's Ozone Season Non-EGU NO_X Reduction Requirement shall equal or exceed, during the appropriate periods, the amount determined in accordance with paragraph (q)(3) of this section.

(iii) If a State meets the requirements of paragraph (a)(2) of this section by imposing control measures on both EGUs and non-EGUs, then:

(A) The Ozone Season Non-EGU NO_X Reduction Requirement shall equal or exceed the difference between the amount specified in paragraph (q)(2) of this section for the appropriate period and the amount of the State's Ozone Season EGU NO_X Budget specified in the SIP revision for the appropriate period; and

(B) The Ozone Season EGU NO_X Budget shall not exceed, during the indicated periods, the amount specified in paragraph (e)(2) of this section plus the amount of the Ozone Season Non-EGU NO_X Reduction Requirement under paragraph (q)(1)(iii)(A) of this section for the appropriate period.

(2) For a State that complies with the requirements of paragraph (a)(2) of this section by imposing control measures on only EGUs, the amount of the Ozone Season EGU NO_X Budget, in tons of NO_X per ozone season, shall be as follows, for the indicated State for the indicated period:

State	Ozone season EGU NO_X budget for 2009–2014 (tons)	Ozone season EGU NO_X budget for 2015 and thereafter (tons)
Alabama	32,182	26,818

NMED Exhibit 7f

State	Ozone season EGU NO_X budget for 2009–2014 (tons)	Ozone season EGU NO_X budget for 2015 and thereafter (tons)
Arkansas	11,515	9,596
Connecticut	2,559	2,559
Delaware	2,226	1,855
District of Columbia	112	94
Florida	47,912	39,926
Illinois	30,701	28,981
Indiana	45,952	39,273
Iowa	14,263	11,886
Kentucky	36,045	30,587
Louisiana	17,085	14,238
Maryland	12,834	10,695
Massachusetts	7,551	6,293
Michigan	28,971	24,142
Mississippi	8,714	7,262
Missouri	26,678	22,231
New Jersey	6,654	5,545
New York	20,632	17,193
North Carolina	28,392	23,660
Ohio	45,664	39,945
Pennsylvania	42,171	35,143
South Carolina	15,249	12,707
Tennessee	22,842	19,035
Virginia	15,994	13,328
West Virginia	26,859	26,525
Wisconsin	17,987	14,989

(3) For a State that complies with the requirements of paragraph (a)(2) of this section by imposing control measures on only non-EGUs, the amount of the Ozone Season Non-EGU NO_X Reduction Requirement, in tons of NO_X per ozone season, shall be determined, for the State for 2009 and thereafter, by subtracting the amount of the State's Ozone Season EGU NO_X Budget for the appropriate year, specified in paragraph (e)(2) of this section, from the amount of the State's NO_X baseline EGU emissions inventory projected for the ozone season in the appropriate year, specified in Table 7 of "Regional and State SO_2 and NO_X Budgets", March 2005 (available at: *http://www.epa.gov/cleanairinterstaterule*).

(4) Notwithstanding the State's obligation to comply with paragraph (q)(2) or (3) of this section, the State's SIP revision may allow sources required by the revision to implement NO_X emission control measures to demonstrate compliance using NO_X SIP Call allowances allocated under the NO_X Budget Trading Program for any ozone season during 2003 through 2008 that have not been deducted by the Administrator under the NO_X Budget Trading Program, if the SIP revision ensures that such allowances will not be available for such deduction under the NO_X Budget Trading Program.

(r) Each SIP revision must set forth control measures to meet the amounts specified in paragraph (q) of this section, as applicable, including the following:

(1) A description of enforcement methods including, but not limited to:

(i) Procedures for monitoring compliance with each of the selected control measures;

(ii) Procedures for handling violations; and

(iii) A designation of agency responsibility for enforcement of implementation.

(2)(i) If a State elects to impose control measures on EGUs, then those measures must impose an ozone season NO_X mass emissions cap on all such sources in the State.

(ii) If a State elects to impose control measures on fossil fuel-fired non-EGUs that are boilers or combustion turbines with a maximum design heat input greater than 250 mmBtu/hr, then those measures must impose an ozone season NO_X mass emissions cap on all such sources in the State.

(iii) If a State elects to impose control measures on non-EGUs other than those described in paragraph (r)(2)(ii) of this section, then those measures must impose an ozone season NO_X mass emissions cap on all such sources in the State or the State must demonstrate why such emissions cap is not practicable and adopt alternative requirements that ensure that the State will comply with its requirements under paragraph (q) of this section, as applicable, in 2009 and subsequent years.

(s)(1) Each SIP revision that contains control measures covering non-EGUs as part or all of a State's obligation in meeting its requirement under paragraph (a)(2) of this section must demonstrate that such control measures are adequate to provide for the timely compliance with the State's Ozone Season Non-EGU NO_X Reduction Requirement under paragraph (q) of this section and are not adopted or implemented by the State, as of May 12, 2005, and are not adopted or implemented by the federal government, as of the date of submission of the SIP revision by the State to EPA.

(2) The demonstration under paragraph (s)(1) of this section must include the following, with respect to each source category of non-EGUs for which the SIP revision requires control measures:

(i) A detailed historical baseline inventory of NO_X mass emissions from the source category in a representative ozone season consisting, at the State's election, of the ozone season in 2002, 2003, 2004, or 2005, or an average of 2 or more of those ozone seasons, absent the control measures specified in the SIP revision.

(A) This inventory must represent estimates of actual emissions based on monitoring data in accordance with subpart H of part 75 of this chapter, if the source category is subject to

NMED Exhibit 7f

monitoring requirements in accordance with subpart H of part 75 of this chapter.

(B) In the absence of monitoring data in accordance with subpart H of part 75 of this chapter, actual emissions must be quantified, to the maximum extent practicable, with the same degree of assurance with which emissions are quantified for sources subject to subpart H of part 75 of this chapter and using source-specific or source-category-specific assumptions that ensure a source's or source category's actual emissions are not overestimated. If a State uses factors to estimate emissions, production or utilization, or effectiveness of controls or rules for a source category, such factors must be chosen to ensure that emissions are not overestimated.

(C) For measures to reduce emissions from motor vehicles, emission estimates must be based on an emissions model that has been approved by EPA for use in SIP development and must be consistent with the planning assumptions regarding vehicle miles traveled and other factors current at the time of the SIP development.

(D) For measures to reduce emissions from nonroad engines or vehicles, emission estimates methodologies must be approved by EPA.

(ii) A detailed baseline inventory of NO_X mass emissions from the source category in ozone seasons 2009 and 2015, absent the control measures specified in the SIP revision and reflecting changes in these emissions from the historical baseline ozone season to the ozone seasons 2009 and 2015, based on projected changes in the production input or output, population, vehicle miles traveled, economic activity, or other factors as applicable to this source category.

(A) These inventories must account for implementation of any control measures that are adopted or implemented by the State, as of May 12, 2005, or adopted or implemented by the federal government, as of the date of submission of the SIP revision by the State to EPA, and must exclude any control measures specified in the SIP revision to meet the NO_X emissions reduction requirements of this section.

(B) Economic and population forecasts must be as specific as possible to the applicable industry, State, and county of the source or source category and must be consistent with both national projections and relevant official planning assumptions including estimates of population and vehicle miles traveled developed through consultation between State and local transportation and air quality agencies. However, if these official planning assumptions are inconsistent with official U.S. Census projections of population or with energy consumption projections contained in the U.S. Department of Energy's most recent Annual Energy Outlook, then the SIP revision must make adjustments to correct the inconsistency or must demonstrate how the official planning assumptions are more accurate.

(C) These inventories must account for any changes in production method, materials, fuels, or efficiency that are expected to occur between the historical baseline ozone season and ozone season 2009 or ozone season 2015, as appropriate.

(iii) A projection of NO_X mass emissions in ozone season 2009 and ozone season 2015 from the source category assuming the same projected changes as under paragraph (s)(2)(ii) of this section and resulting from implementation of each of the control measures specified in the SIP revision.

(A) These inventories must address the possibility that the State's new control measures may cause production or utilization, and emissions, to shift to unregulated or less stringently regulated sources in the source category in the same or another State, and these inventories must include any such amounts of emissions that may shift to such other sources.

(B) The State must provide EPA with a summary of the computations, assumptions, and judgments used to determine the degree of reduction in projected ozone season 2009 and ozone season 2015 NO_X emissions that will be achieved from the implementation of the new control measures compared to the relevant baseline emissions inventory.

(iv) The result of subtracting the amounts in paragraph (s)(2)(iii) of this section for ozone season 2009 and ozone season 2015, respectively, from the lower of the amounts in paragraph (s)(2)(i) or (s)(2)(ii) of this section for ozone season 2009 and ozone season 2015, respectively, may be credited towards the State's Ozone Season Non-EGU NO_X Reduction Requirement in paragraph (q)(3) of this section for the appropriate period.

(v) Each SIP revision must identify the sources of the data used in each estimate and each projection of emissions.

(t) Each SIP revision must comply with § 51.116 (regarding data availability).

(u) Each SIP revision must provide for monitoring the status of compliance with any control measures adopted to meet the State's requirements under paragraph (q) of this section as follows:

(1) The SIP revision must provide for legally enforceable procedures for requiring owners or operators of stationary sources to maintain records of, and periodically report to the State:

(i) Information on the amount of NO_X emissions from the stationary sources; and

(ii) Other information as may be necessary to enable the State to determine whether the sources are in compliance with applicable portions of the control measures;

(2) The SIP revision must comply with § 51.212 (regarding testing, inspection, enforcement, and complaints);

(3) If the SIP revision contains any transportation control measures, then the SIP revision must comply with § 51.213 (regarding transportation control measures);

(4)(i) If the SIP revision contains measures to control EGUs, then the SIP revision must require such sources to comply with the monitoring, recordkeeping, and reporting provisions of subpart H of part 75 of this chapter.

(ii) If the SIP revision contains measures to control fossil fuel-fired non-EGUs that are boilers or combustion turbines with a maximum design heat input greater than 250 mmBtu/hr, then the SIP revision must require such sources to comply with the monitoring, recordkeeping, and reporting provisions of subpart H of part 75 of this chapter.

(iii) If the SIP revision contains measures to control any other non-EGUs that are not described in paragraph (u)(4)(ii) of this section, then the SIP revision must require such sources to comply with the monitoring, recordkeeping, and reporting provisions of subpart H of part 75 of this chapter, or the State must demonstrate why such requirements are not practicable and adopt alternative requirements that ensure that the required emissions reductions will be quantified, to the maximum extent practicable, with the same degree of assurance with which emissions are quantified for sources subject to subpart H of part 75 of this chapter.

(v) Each SIP revision must show that the State has legal authority to carry out the SIP revision, including authority to:

(1) Adopt emissions standards and limitations and any other measures necessary for attainment and maintenance of the State's relevant Ozone Season EGU NO_X Budget or the Ozone Season Non-EGU NO_X Reduction Requirement, as applicable, under paragraph (q) of this section;

NMED Exhibit 7f

(2) Enforce applicable laws, regulations, and standards and seek injunctive relief;

(3) Obtain information necessary to determine whether air pollution sources are in compliance with applicable laws, regulations, and standards, including authority to require recordkeeping and to make inspections and conduct tests of air pollution sources; and

(4)(i) Require owners or operators of stationary sources to install, maintain, and use emissions monitoring devices and to make periodic reports to the State on the nature and amounts of emissions from such stationary sources; and

(ii) Make the data described in paragraph (v)(4)(i) of this section available to the public within a reasonable time after being reported and as correlated with any applicable emissions standards or limitations.

(w)(1) The provisions of law or regulation that the State determines provide the authorities required under this section must be specifically identified, and copies of such laws or regulations must be submitted with the SIP revision.

(2) Legal authority adequate to fulfill the requirements of paragraphs (v)(3) and (4) of this section may be delegated to the State under section 114 of the CAA.

(x)(1) A SIP revision may assign legal authority to local agencies in accordance with § 51.232.

(2) Each SIP revision must comply with § 51.240 (regarding general plan requirements).

(y) Each SIP revision must comply with § 51.280 (regarding resources).

(z) Each SIP revision must provide for State compliance with the reporting requirements in § 51.125.

(aa)(1) Notwithstanding any other provision of this section, if a State adopts regulations substantively identical to subparts AAAA through IIII of part 96 of this chapter (CAIR Ozone Season NO_X Trading Program), incorporates such subparts by reference into its regulations, or adopts regulations that differ substantively from such subparts only as set forth in paragraph (aa)(2) of this section, then such emissions trading program in the State's SIP revision is automatically approved as meeting the requirements of paragraph (q) of this section, provided that the State has the legal authority to take such action and to implement its responsibilities under such regulations.

(2) If a State adopts an emissions trading program that differs substantively from subparts AAAA through IIII of part 96 of this chapter only as follows, then the emissions trading program is approved as set forth in paragraph (aa)(1) of this section.

(i) The State may expand the applicability provisions in § 96.304 to include all non-EGUs subject to the State's emissions trading program approved under § 51.121(p).

(ii) The State may decline to adopt the CAIR NO_X Ozone Season opt-in provisions of:

(A) Subpart IIII of this part and the provisions applicable only to CAIR NO_X Ozone Season opt-in units in subparts AAAA through HHHH of this part;

(B) Section 96.388(b) of this chapter and the provisions of subpart IIII of this part applicable only to CAIR NO_X Ozone Season opt-in units under § 96.388(b); or

(C) Section 96.388(c) of this chapter and the provisions of subpart IIII of this part applicable only to CAIR NO_X Ozone Season opt-in units under § 96.388(c).

(iii) The State may decline to adopt the allocation provisions set forth in subpart EEEE of part 96 of this chapter and may instead adopt any methodology for allocating CAIR NO_X Ozone Season allowances to individual sources, as follows:

(A) The State may provide for issuance of an amount of CAIR Ozone Season NO_X allowances for an ozone season, in addition to the amount in the State's Ozone Season EGU NO_X Budget for such ozone season, not exceeding the amount of NO_X SIP Call allowances allocated for the ozone season under the NO_X Budget Trading Program to non-EGUs that the applicability provisions in § 96.304 are expanded to include under paragraph (aa)(2)(i) of this section;

(B) The State's methodology must not allow the State to allocate CAIR Ozone Season NO_X allowances for an ozone season in excess of the amount in the State's Ozone Season EGU NO_X Budget for such ozone season plus any additional amount of CAIR Ozone Season NO_X allowances issued under paragraph (aa)(2)(iii)(A) of this section for such ozone season;

(C) The State's methodology must require that, for EGUs commencing operation before January 1, 2001, the State will determine, and notify the Administrator of, each unit's allocation of CAIR NO_X allowances by October 31, 2006 for the ozone seasons 2009, 2010, and 2011 and by October 31, 2008 and October 31 of each year thereafter for the ozone season in the 4th year after the year of the notification deadline; and

(D) The State's methodology must require that, for EGUs commencing operation on or after January 1, 2001, the State will determine, and notify the Administrator of, each unit's allocation of CAIR Ozone Season NO_X allowances by July 31 of the calendar year of the ozone season for which the CAIR Ozone Season NO_X allowances are allocated.

(3) A State that adopts an emissions trading program in accordance with paragraph (aa)(1) or (2) of this section is not required to adopt an emissions trading program in accordance with paragraph (o)(1) or (2) of this section or § 51.153(o)(1) or (2).

(4) If a State adopts an emissions trading program that differs substantively from subparts AAAA through IIII of part 96 of this chapter, other than as set forth in paragraph (aa)(2) of this section, then such emissions trading program is not automatically approved as set forth in paragraph (aa)(1) or (2) of this section and will be reviewed by the Administrator for approvability in accordance with the other provisions of this section, provided that the NO_X allowances issued under such emissions trading program shall not, and the SIP revision shall state that such NO_X allowances shall not, qualify as CAIR NO_X allowances or CAIR Ozone Season NO_X allowances under any emissions trading program approved under paragraphs (o)(1) or (2) or (aa)(1) or (2) of this section.

(bb)(1)(i) The State may revise its SIP to provide that, for each ozone season during which a State implements control measures on EGUs or non-EGUs through an emissions trading program approved under paragraph (aa)(1) or (2) of this section, such EGUs and non-EGUs shall not be subject to the requirements of the State's SIP meeting the requirements of § 51.121, if the State meets the requirement in paragraph (bb)(1)(ii) of this section.

(ii) For a State under paragraph (bb)(1)(i) of this section, if the State's amount of tons specified in paragraph (q)(2) of this section exceeds the State's amount of NO_X SIP Call allowances allocated for the ozone season in 2009 or in any year thereafter for the same types and sizes of units as those covered by the amount of tons specified in paragraph (q)(2) of this section, then the State must replace the former amount for such ozone season by the latter amount for such ozone season in applying paragraph (q) of this section.

(2) Rhode Island may revise its SIP to provide that, for each ozone season during which Rhode Island implements control measures on EGUs and non-EGUs through an emissions trading program adopted in regulations that differ substantively from subparts AAAA through IIII of part 96 of this

NMED Exhibit 7f

chapter as set forth in this paragraph, such EGUs and non-EGUs shall not be subject to the requirements of the State's SIP meeting the requirements of § 51.121.

(i) Rhode Island must expand the applicability provisions in § 96.304 to include all non-EGUs subject to Rhode Island's emissions trading program approved under § 51.121(p).

(ii) Rhode Island may decline to adopt the CAIR NO_X Ozone Season opt-in provisions of:

(A) Subpart IIII of this part and the provisions applicable only to CAIR NO_X Ozone Season opt-in units in subparts AAAA through HHHH of this part;

(B) Section 96.388(b) of this chapter and the provisions of subpart IIII of this part applicable only to CAIR NO_X Ozone Season opt-in units under § 96.388(b); or

(C) Section 96.388(c) of this chapter and the provisions of subpart IIII of this part applicable only to CAIR NO_X Ozone Season opt-in units under § 96.388(c).

(iii) Rhode Island may adopt the allocation provisions set forth in subpart EEEE of part 96 of this chapter, provided that Rhode Island must provide for issuance of an amount of CAIR Ozone Season NO_X allowances for an ozone season not exceeding 936 tons for 2009 and thereafter;

(iv) Rhode Island may adopt any methodology for allocating CAIR NO_X Ozone Season allowances to individual sources, as follows:

(A) Rhode Island's methodology must not allow Rhode Island to allocate CAIR Ozone Season NO_X allowances for an ozone season in excess of 936 tons for 2009 and thereafter;

(B) Rhode Island's methodology must require that, for EGUs commencing operation before January 1, 2001, Rhode Island will determine, and notify the Administrator of, each unit's allocation of CAIR NO_X allowances by October 31, 2006 for the ozone seasons 2009, 2010, and 2011 and by October 31, 2008 and October 31 of each year thereafter for the ozone season in the 4th year after the year of the notification deadline; and

(C) Rhode Island's methodology must require that, for EGUs commencing operation on or after January 1, 2001, Rhode Island will determine, and notify the Administrator of, each unit's allocation of CAIR Ozone Season NO_X allowances by July 31 of the calendar year of the ozone season for which the CAIR Ozone Season NO_X allowances are allocated.

(3) Notwithstanding a SIP revision by a State authorized under paragraph (bb)(1) of this section or by Rhode Island under paragraph (bb)(2) of this section, if the State's or Rhode Island's SIP that, without such SIP revision, imposes control measures on EGUs or non-EGUs under § 51.121 is determined by the Administrator to meet the requirements of § 51.121, such SIP shall be deemed to continue to meet the requirements of § 51.121.

(cc) The terms used in this section shall have the following meanings:

Administrator means the Administrator of the United States Environmental Protection Agency or the Administrator's duly authorized representative.

Allocate or *allocation* means, with regard to allowances, the determination of the amount of allowances to be initially credited to a source.

Boiler means an enclosed fossil- or other-fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

Bottoming-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful thermal energy and at least some of the reject heat from the useful thermal energy application or process is then used for electricity production.

Clean Air Act or *CAA* means the Clean Air Act, 42 U.S.C. 7401, *et seq.*

Cogeneration unit means a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine:

(1) Having equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through the sequential use of energy; and

(2) Producing during the 12-month period starting on the date the unit first produces electricity and during any calendar year after which the unit first produces electricity—

(i) For a topping-cycle cogeneration unit,

(A) Useful thermal energy not less than 5 percent of total energy output; and

(B) Useful power that, when added to one-half of useful thermal energy produced, is not less then 42.5 percent of total energy input, if useful thermal energy produced is 15 percent or more of total energy output, or not less than 45 percent of total energy input, if useful thermal energy produced is less than 15 percent of total energy output.

(ii) For a bottoming-cycle cogeneration unit, useful power not less than 45 percent of total energy input.

Combustion turbine means:

(1) An enclosed device comprising a compressor, a combustor, and a turbine and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine; and

(2) If the enclosed device under paragraph (1) of this definition is combined cycle, any associated heat recovery steam generator and steam turbine.

Commence operation means to have begun any mechanical, chemical, or electronic process, including, with regard to a unit, start-up of a unit's combustion chamber.

Electric generating unit or *EGU* means:

(1) Except as provided in paragraph (2) of this definition, a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine serving at any time, since the start-up of the unit's combustion chamber, a generator with nameplate capacity of more than 25 MWe producing electricity for sale.

(2) For a unit that qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity and continues to qualify as a cogeneration unit, a cogeneration unit serving at any time a generator with nameplate capacity of more than 25 MWe and supplying in any calendar year more than one-third of the unit's potential electric output capacity or 219,000 MWh, whichever is greater, to any utility power distribution system for sale. If a unit qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity but subsequently no longer qualifies as a cogeneration unit, the unit shall be subject to paragraph (1) of this definition starting on the day on which the unit first no longer qualifies as a cogeneration unit.

Fossil fuel means natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material.

Fossil-fuel-fired means, with regard to a unit, combusting any amount of fossil fuel in any calendar year.

Generator means a device that produces electricity.

Maximum design heat input means:

(1) Starting from the initial installation of a unit, the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis as specified by the manufacturer of the unit;

(2)(i) Except as provided in paragraph (2)(ii) of this definition, starting from the completion of any subsequent physical change in the unit resulting in an increase in the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis, such increased maximum amount

NMED Exhibit 7f

as specified by the person conducting the physical change; or

(ii) For purposes of applying the definition of the term ''potential electrical output capacity,'' starting from the completion of any subsequent physical change in the unit resulting in a decrease in the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis, such decreased maximum amount as specified by the person conducting the physical change.

NAAQS means National Ambient Air Quality Standard.

Nameplate capacity means, starting from the initial installation of a generator, the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other deratings) as specified by the manufacturer of the generator or, starting from the completion of any subsequent physical change in the generator resulting in an increase in the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other deratings), such increased maximum amount as specified by the person conducting the physical change.

Non-EGU means a source of NO_X emissions that is not an EGU.

NO_X Budget Trading Program means a multi-state nitrogen oxides air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts A through I of this part and § 51.121, as a means of mitigating interstate transport of ozone and nitrogen oxides.

NO_X SIP Call allowance means a limited authorization issued by the Administrator under the NO_X Budget Trading Program to emit up to one ton of nitrogen oxides during the ozone season of the specified year or any year thereafter, provided that the provision in §51.121(b)(2)(ii)(E) shall not be used in applying this definition.

Ozone season means the period, which begins May 1 and ends September 30 of any year.

Potential electrical output capacity means 33 percent of a unit's maximum design heat input, divided by 3,413 Btu/kWh, divided by 1,000 kWh/MWh, and multiplied by 8,760 hr/yr.

Sequential use of energy means:

(1) For a topping-cycle cogeneration unit, the use of reject heat from electricity production in a useful thermal energy application or process; or

(2) For a bottoming-cycle cogeneration unit, the use of reject heat from useful thermal energy application or process in electricity production.

Topping-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful power, including electricity, and at least some of the reject heat from the electricity production is then used to provide useful thermal energy.

Total energy input means, with regard to a cogeneration unit, total energy of all forms supplied to the cogeneration unit, excluding energy produced by the cogeneration unit itself.

Total energy output means, with regard to a cogeneration unit, the sum of useful power and useful thermal energy produced by the cogeneration unit.

Unit means a stationary, fossil-fuel-fired boiler or a stationary, fossil-fuel-fired combustion turbine.

Useful power means, with regard to a cogeneration unit, electricity or mechanical energy made available for use, excluding any such energy used in the power production process (which process includes, but is not limited to, any on-site processing or treatment of fuel combusted at the unit and any on-site emission controls).

Useful thermal energy means, with regard to a cogeneration unit, thermal energy that is:

(1) Made available to an industrial or commercial process, excluding any heat contained in condensate return or makeup water;

(2) Used in a heat application (*e.g.*, space heating or domestic hot water heating); or

(3) Used in a space cooling application (*i.e.*, thermal energy used by an absorption chiller).

Utility power distribution system means the portion of an electricity grid owned or operated by a utility and dedicated to delivering electricity to customers.

(dd) New Hampshire may revise its SIP to implements control measures on EGUs and non-EGUs through an emissions trading program adopted in regulations that differ substantively from subparts AAAA through IIII of part 96 of this chapter as set forth in this paragraph.

(1) New Hampshire must expand the applicability provisions in § 96.304 of this chapter to include all non-EGUs subject to New Hampshire's emissions trading program at New Hampshire Code of Administrative Rules, chapter Env-A 3200 (2004).

(2) New Hampshire may decline to adopt the CAIR NO_X Ozone Season opt-in provisions of:

(i) Subpart IIII of this part and the provisions applicable only to CAIR NO_X Ozone Season opt-in units in subparts AAAA through HHHH of this part;

(ii) Section 96.388(b) of this chapter and the provisions of subpart IIII of this part applicable only to CAIR NO_X Ozone Season opt-in units under § 96.388(b); or

(iii) Section 96.388(c) of this chapter and the provisions of subpart IIII of this part applicable only to CAIR NO_X Ozone Season opt-in units under § 96.388(c).

(3) New Hampshire may adopt the allocation provisions set forth in subpart EEEE of part 96 of this chapter, provided that New Hampshire must provide for issuance of an amount of CAIR Ozone Season NO_X allowances for an ozone season not exceeding 3,000 tons for 2009 and thereafter;

(4) New Hampshire may adopt any methodology for allocating CAIR NO_X Ozone Season allowances to individual sources, as follows:

(i) New Hampshire's methodology must not allow New Hampshire to allocate CAIR Ozone Season NO_X allowances for an ozone season in excess of 3,000 tons for 2009 and thereafter;

(ii) New Hampshire's methodology must require that, for EGUs commencing operation before January 1, 2001, New Hampshire will determine, and notify the Administrator of, each unit's allocation of CAIR NO_X allowances by October 31, 2006 for the ozone seasons 2009, 2010, and 2011 and by October 31, 2008 and October 31 of each year thereafter for the ozone season in the 4th year after the year of the notification deadline; and

(iii) New Hampshire's methodology must require that, for EGUs commencing operation on or after January 1, 2001, New Hampshire will determine, and notify the Administrator of, each unit's allocation of CAIR Ozone Season NO_X allowances by July 31 of the calendar year of the ozone season for which the CAIR Ozone Season NO_X allowances are allocated.

■ 5. Part 51 is amended by adding § 51.124 to Subpart G to read as follows:

§ 51.124 Findings and requirements for submission of State implementation plan revisions relating to emissions of sulfur dioxide pursuant to the Clean Air Interstate Rule.

(a) Under section 110(a)(1) of the CAA, 42 U.S.C. 7410(a)(1), the Administrator determines that each State identified in paragraph (c) of this

NMED Exhibit 7f

section must submit a SIP revision to comply with the requirements of section 110(a)(2)(D)(i)(I) of the CAA, 42 U.S.C. 7410(a)(2)(D)(i)(I), through the adoption of adequate provisions prohibiting sources and other activities from emitting SO_2 in amounts that will contribute significantly to nonattainment in, or interfere with maintenance by, one or more other States with respect to the fine particles ($PM_{2.5}$) NAAQS.

(b) For each State identified in paragraph (c) of this section, the SIP revision required under paragraph (a) of this section will contain adequate provisions, for purposes of complying with section 110(a)(2)(D)(i)(I) of the CAA, 42 U.S.C. 7410(a)(2)(D)(i)(I), only if the SIP revision contains control measures that assure compliance with the applicable requirements of this section.

(c) The following States are subject to the requirements of this section: Alabama, Florida, Georgia, Illinois, Indiana, Iowa, Kentucky, Louisiana, Maryland, Michigan, Minnesota, Mississippi, Missouri, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Texas, Virginia, West Virginia, and Wisconsin, and the District of Columbia.

(d)(1) The SIP revision under paragraph (a) of this section must be submitted to EPA by no later than September 11, 2006.

(2) The requirements of appendix V to this part shall apply to the SIP revision under paragraph (a) of this section.

(3) The State shall deliver 5 copies of the SIP revision under paragraph (a) of this section to the appropriate Regional Office, with a letter giving notice of such action.

(e) The State's SIP revision shall contain control measures and demonstrate that they will result in compliance with the State's Annual EGU SO_2 Budget, if applicable, and achieve the State's Annual Non-EGU SO_2 Reduction Requirement, if applicable, for the appropriate periods. The amounts of the State's Annual EGU SO_2 Budget and Annual Non-EGU SO_2 Reduction Requirement shall be determined as follows:

(1)(i) The Annual EGU SO_2 Budget for the State is defined as the total amount of SO_2 emissions from all EGUs in that State for a year, if the State meets the requirements of paragraph (a) of this section by imposing control measures, at least in part, on EGUs. If the State imposes control measures under this section on only EGUs, the Annual EGU SO_2 Budget for the State shall not exceed the amount, during the indicated periods, specified in paragraph (e)(2) of this section.

(ii) The Annual Non-EGU SO_2 Reduction Requirement, if applicable, is defined as the total amount of SO_2 emission reductions that the State demonstrates, in accordance with paragraph (g) of this section, it will achieve from non-EGUs during the appropriate period. If the State meets the requirements of paragraph (a) of this section by imposing control measures on only non-EGUs, then the State's Annual Non-EGU SO_2 Reduction Requirement shall equal or exceed, during the appropriate periods, the amount determined in accordance with paragraph (e)(3) of this section.

(iii) If a State meets the requirements of paragraph (a) of this section by imposing control measures on both EGUs and non-EGUs, then:

(A) The Annual Non-EGU SO_2 Reduction Requirement shall equal or exceed the difference between the amount specified in paragraph (e)(2) of this section for the appropriate period and the amount of the State's Annual EGU SO_2 Budget specified in the SIP revision for the appropriate period; and

(B) The Annual EGU SO_2 Budget shall not exceed, during the indicated periods, the amount specified in paragraph (e)(2) of this section plus the amount of the Annual Non-EGU SO_2 Reduction Requirement under paragraph (e)(1)(iii)(A) of this section for the appropriate period.

(2) For a State that complies with the requirements of paragraph (a) of this section by imposing control measures on only EGUs, the amount of the Annual EGU SO_2 Budget, in tons of SO_2 per year, shall be as follows, for the indicated State for the indicated period:

State	Annual EGU SO_2 budget for 2010–2014 (tons)	Annual EGU SO_2 budget for 2015 and thereafter (tons)
Alabama	157,582	110,307
District of Columbia	708	495
Florida	253,450	177,415
Georgia	213,057	149,140
Illinois	192,671	134,869
Indiana	254,599	178,219
Iowa	64,095	44,866
Kentucky	188,773	132,141
Louisiana	59,948	41,963
Maryland	70,697	49,488
Michigan	178,605	125,024
Minnesota	49,987	34,991
Mississippi	33,763	23,634
Missouri	137,214	96,050
New York	135,139	94,597
North Carolina	137,342	96,139
Ohio	333,520	233,464
Pennsylvania	275,990	193,193
South Carolina	57,271	40,089
Tennessee	137,216	96,051
Texas	320,946	224,662
Virginia	63,478	44,435
West Virginia	215,881	151,117
Wisconsin	87,264	61,085

NMED Exhibit 7f

(3) For a State that complies with the requirements of paragraph (a) of this section by imposing control measures on only non-EGUs, the amount of the Annual Non-EGU SO_2 Reduction Requirement, in tons of SO_2 per year, shall be determined, for the State for 2010 and thereafter, by subtracting the amount of the State's Annual EGU SO_2 Budget for the appropriate year, specified in paragraph (e)(2) of this section, from an amount equal to 2 times the State's Annual EGU SO_2 Budget for 2010 through 2014, specified in paragraph (e)(2) of this section.

(f) Each SIP revision must set forth control measures to meet the amounts specified in paragraph (e) of this section, as applicable, including the following:

(1) A description of enforcement methods including, but not limited to:

(i) Procedures for monitoring compliance with each of the selected control measures;

(ii) Procedures for handling violations; and

(iii) A designation of agency responsibility for enforcement of implementation.

(2)(i) If a State elects to impose control measures on EGUs, then those measures must impose an annual SO_2 mass emissions cap on all such sources in the State.

(ii) If a State elects to impose control measures on fossil fuel-fired non-EGUs that are boilers or combustion turbines with a maximum design heat input greater than 250 mmBtu/hr, then those measures must impose an annual SO_2 mass emissions cap on all such sources in the State.

(iii) If a State elects to impose control measures on non-EGUs other than those described in paragraph (f)(2)(ii) of this section, then those measures must impose an annual SO_2 mass emissions cap on all such sources in the State, or the State must demonstrate why such emissions cap is not practicable, and adopt alternative requirements that ensure that the State will comply with its requirements under paragraph (e) of this section, as applicable, in 2010 and subsequent years.

(g)(1) Each SIP revision that contains control measures covering non-EGUs as part or all of a State's obligation in meeting its requirement under paragraph (a) of this section must demonstrate that such control measures are adequate to provide for the timely compliance with the State's Annual Non-EGU SO_2 Reduction Requirement under paragraph (e) of this section and are not adopted or implemented by the State, as of May 12, 2005, and are not adopted or implemented by the federal government, as of the date of submission of the SIP revision by the State to EPA.

(2) The demonstration under paragraph (g)(1) of this section must include the following, with respect to each source category of non-EGUs for which the SIP revision requires control measures:

(i) A detailed historical baseline inventory of SO_2 mass emissions from the source category in a representative year consisting, at the State's election, of 2002, 2003, 2004, or 2005, or an average of 2 or more of those years, absent the control measures specified in the SIP revision.

(A) This inventory must represent estimates of actual emissions based on monitoring data in accordance with part 75 of this chapter, if the source category is subject to part 75 monitoring requirements in accordance with part 75 of this chapter.

(B) In the absence of monitoring data in accordance with part 75 of this chapter, actual emissions must be quantified, to the maximum extent practicable, with the same degree of assurance with which emissions are quantified for sources subject to part 75 of this chapter and using source-specific or source-category-specific assumptions that ensure a source's or source category's actual emissions are not overestimated. If a State uses factors to estimate emissions, production or utilization, or effectiveness of controls or rules for a source category, such factors must be chosen to ensure that emissions are not overestimated.

(C) For measures to reduce emissions from motor vehicles, emission estimates must be based on an emissions model that has been approved by EPA for use in SIP development and must be consistent with the planning assumptions regarding vehicle miles traveled and other factors current at the time of the SIP development.

(D) For measures to reduce emissions from nonroad engines or vehicles, emission estimates methodologies must be approved by EPA.

(ii) A detailed baseline inventory of SO_2 mass emissions from the source category in the years 2010 and 2015, absent the control measures specified in the SIP revision and reflecting changes in these emissions from the historical baseline year to the years 2010 and 2015, based on projected changes in the production input or output, population, vehicle miles traveled, economic activity, or other factors as applicable to this source category.

(A) These inventories must account for implementation of any control measures that are adopted or implemented by the State, as of May 12, 2005, or adopted or implemented by the federal government, as of the date of submission of the SIP revision by the State to EPA, and must exclude any control measures specified in the SIP revision to meet the SO_2 emissions reduction requirements of this section.

(B) Economic and population forecasts must be as specific as possible to the applicable industry, State, and county of the source or source category and must be consistent with both national projections and relevant official planning assumptions, including estimates of population and vehicle miles traveled developed through consultation between State and local transportation and air quality agencies. However, if these official planning assumptions are inconsistent with official U.S. Census projections of population or with energy consumption projections contained in the U.S. Department of Energy's most recent Annual Energy Outlook, then the SIP revision must make adjustments to correct the inconsistency or must demonstrate how the official planning assumptions are more accurate.

(C) These inventories must account for any changes in production method, materials, fuels, or efficiency that are expected to occur between the historical baseline year and 2010 or 2015, as appropriate.

(iii) A projection of SO_2 mass emissions in 2010 and 2015 from the source category assuming the same projected changes as under paragraph (g)(2)(ii) of this section and resulting from implementation of each of the control measures specified in the SIP revision.

(A) These inventories must address the possibility that the State's new control measures may cause production or utilization, and emissions, to shift to unregulated or less stringently regulated sources in the source category in the same or another State, and these inventories must include any such amounts of emissions that may shift to such other sources.

(B) The State must provide EPA with a summary of the computations, assumptions, and judgments used to determine the degree of reduction in projected 2010 and 2015 SO_2 emissions that will be achieved from the implementation of the new control measures compared to the relevant baseline emissions inventory.

(iv) The result of subtracting the amounts in paragraph (g)(2)(iii) of this section for 2010 and 2015, respectively, from the lower of the amounts in paragraph (g)(2)(i) or (g)(2)(ii) of this section for 2010 and 2015, respectively,

NMED Exhibit 7f

may be credited towards the State's Annual Non-EGU SO_2 Reduction Requirement in paragraph (e)(3) of this section for the appropriate period.

(v) Each SIP revision must identify the sources of the data used in each estimate and each projection of emissions.

(h) Each SIP revision must comply with § 51.116 (regarding data availability).

(i) Each SIP revision must provide for monitoring the status of compliance with any control measures adopted to meet the State's requirements under paragraph (e) of this section, as follows:

(1) The SIP revision must provide for legally enforceable procedures for requiring owners or operators of stationary sources to maintain records of, and periodically report to the State:

(i) Information on the amount of SO_2 emissions from the stationary sources; and

(ii) Other information as may be necessary to enable the State to determine whether the sources are in compliance with applicable portions of the control measures;

(2) The SIP revision must comply with § 51.212 (regarding testing, inspection, enforcement, and complaints);

(3) If the SIP revision contains any transportation control measures, then the SIP revision must comply with § 51.213 (regarding transportation control measures);

(4)(i) If the SIP revision contains measures to control EGUs, then the SIP revision must require such sources to comply with the monitoring, recordkeeping, and reporting provisions of part 75 of this chapter.

(ii) If the SIP revision contains measures to control fossil fuel-fired non-EGUs that are boilers or combustion turbines with a maximum design heat input greater than 250 mmBtu/hr, then the SIP revision must require such sources to comply with the monitoring, recordkeeping, and reporting provisions of part 75 of this chapter.

(iii) If the SIP revision contains measures to control any other non-EGUs that are not described in paragraph (i)(4)(ii) of this section, then the SIP revision must require such sources to comply with the monitoring, recordkeeping, and reporting provisions of part 75 of this chapter, or the State must demonstrate why such requirements are not practicable and adopt alternative requirements that ensure that the required emissions reductions will be quantified, to the maximum extent practicable, with the same degree of assurance with which emissions are quantified for sources subject to part 75 of this chapter.

(j) Each SIP revision must show that the State has legal authority to carry out the SIP revision, including authority to:

(1) Adopt emissions standards and limitations and any other measures necessary for attainment and maintenance of the State's relevant Annual EGU SO_2 Budget or the Annual Non-EGU SO_2 Reduction Requirement, as applicable, under paragraph (e) of this section;

(2) Enforce applicable laws, regulations, and standards and seek injunctive relief;

(3) Obtain information necessary to determine whether air pollution sources are in compliance with applicable laws, regulations, and standards, including authority to require recordkeeping and to make inspections and conduct tests of air pollution sources; and

(4)(i) Require owners or operators of stationary sources to install, maintain, and use emissions monitoring devices and to make periodic reports to the State on the nature and amounts of emissions from such stationary sources; and

(ii) Make the data described in paragraph (j)(4)(i) of this section available to the public within a reasonable time after being reported and as correlated with any applicable emissions standards or limitations.

(k)(1) The provisions of law or regulation that the State determines provide the authorities required under this section must be specifically identified, and copies of such laws or regulations must be submitted with the SIP revision.

(2) Legal authority adequate to fulfill the requirements of paragraphs (j)(3) and (4) of this section may be delegated to the State under section 114 of the CAA.

(l)(1) A SIP revision may assign legal authority to local agencies in accordance with § 51.232.

(2) Each SIP revision must comply with § 51.240 (regarding general plan requirements).

(m) Each SIP revision must comply with § 51.280 (regarding resources).

(n) Each SIP revision must provide for State compliance with the reporting requirements in § 51.125.

(o)(1) Notwithstanding any other provision of this section, if a State adopts regulations substantively identical to subparts AAA through III of part 96 of this chapter (CAIR SO_2 Trading Program), incorporates such subparts by reference into its regulations, or adopts regulations that differ substantively from such subparts only as set forth in paragraph (o)(2) of this section, then such emissions trading program in the State's SIP revision is automatically approved as meeting the requirements of paragraph (e) of this section, provided that the State has the legal authority to take such action and to implement its responsibilities under such regulations.

(2) If a State adopts an emissions trading program that differs substantively from subparts AAA through III of part 96 of this chapter only as follows, then the emissions trading program is approved as set forth in paragraph (o)(1) of this section.

(i) The State may decline to adopt the CAIR SO_2 opt-in provisions of subpart III of this part and the provisions applicable only to CAIR SO_2 opt-in units in subparts AAA through HHH of this part.

(ii) The State may decline to adopt the CAIR SO_2 opt-in provisions of § 96.288(b) of this chapter and the provisions of subpart III of this part applicable only to CAIR SO_2 opt-in units under § 96.288(b).

(iii) The State may decline to adopt the CAIR SO_2 opt-in provisions of § 96.288(c) of this chapter and the provisions of subpart II of this part applicable only to CAIR SO_2 opt-in units under § 96.288(c).

(3) A State that adopts an emissions trading program in accordance with paragraph (o)(1) or (2) of this section is not required to adopt an emissions trading program in accordance with § 96.123 (o)(1) or (2) or (aa)(1) or (2) of this chapter.

(4) If a State adopts an emissions trading program that differs substantively from subparts AAA through III of part 96 of this chapter, other than as set forth in paragraph (o)(2) of this section, then such emissions trading program is not automatically approved as set forth in paragraph (o)(1) or (2) of this section and will be reviewed by the Administrator for approvability in accordance with the other provisions of this section, provided that the SO_2 allowances issued under such emissions trading program shall not, and the SIP revision shall state that such SO_2 allowances shall not, qualify as CAIR SO_2 allowances under any emissions trading program approved under paragraph (o)(1) or (2) of this section.

(p) If a State's SIP revision does not contain an emissions trading program approved under paragraph (o)(1) or (2) of this section but contains control measures on EGUs as part or all of a State's obligation in meeting its requirement under paragraph (a) of this section:

(1) The SIP revision shall provide, for each year that the State has such

NMED Exhibit 7f

obligation, for the permanent retirement of an amount of Acid Rain allowances allocated to sources in the State for that year and not deducted by the Administrator under the Acid Rain Program and any emissions trading program approved under paragraph (o)(1) or (2) of this section, equal to the difference between—

(A) The total amount of Acid Rain allowances allocated under the Acid Rain Program to the sources in the State for that year; and

(B) If the State's SIP revision contains only control measures on EGUs, the State's Annual EGU SO_2 Budget for the appropriate period as specified in paragraph (e)(2) of this section or, if the State's SIP revision contains control measures on EGUs and non-EGUs, the State's Annual EGU SO_2 Budget for the appropriate period as specified in the SIP revision.

(2) The SIP revision providing for permanent retirement of Acid Rain allowances under paragraph (p)(1) of this section must ensure that such allowances are not available for deduction by the Administrator under the Acid Rain Program and any emissions trading program approved under paragraph (o)(1) or (2) of this section.

(q) The terms used in this section shall have the following meanings:

Acid Rain allowance means a limited authorization issued by the Administrator under the Acid Rain Program to emit up to one ton of sulfur dioxide during the specified year or any year thereafter, except as otherwise provided by the Administrator.

Acid Rain Program means a multi-State sulfur dioxide and nitrogen oxides air pollution control and emissions reduction program established by the Administrator under title IV of the CAA and parts 72 through 78 of this chapter.

Administrator means the Administrator of the United States Environmental Protection Agency or the Administrator's duly authorized representative.

Allocate or *allocation* means, with regard to allowances, the determination of the amount of allowances to be initially credited to a source.

Boiler means an enclosed fossil- or other-fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

Bottoming-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful thermal energy and at least some of the reject heat from the useful thermal energy application or process is then used for electricity production.

Clean Air Act or *CAA* means the Clean Air Act, 42 U.S.C. 7401, *et seq.*

Cogeneration unit means a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine:

(1) Having equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through the sequential use of energy; and

(2) Producing during the 12-month period starting on the date the unit first produces electricity and during any calendar year after which the unit first produces electricity—

(i) For a topping-cycle cogeneration unit,

(A) Useful thermal energy not less than 5 percent of total energy output; and

(B) Useful power that, when added to one-half of useful thermal energy produced, is not less then 42.5 percent of total energy input, if useful thermal energy produced is 15 percent or more of total energy output, or not less than 45 percent of total energy input, if useful thermal energy produced is less than 15 percent of total energy output.

(ii) For a bottoming-cycle cogeneration unit, useful power not less than 45 percent of total energy input.

Combustion turbine means:

(1) An enclosed device comprising a compressor, a combustor, and a turbine and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine; and

(2) If the enclosed device under paragraph (1) of this definition is combined cycle, any associated heat recovery steam generator and steam turbine.

Commence operation means to have begun any mechanical, chemical, or electronic process, including, with regard to a unit, start-up of a unit's combustion chamber.

Electric generating unit or *EGU* means:

(1) Except as provided in paragraph (2) of this definition, a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine serving at any time, since the start-up of the unit's combustion chamber, a generator with nameplate capacity of more than 25 MWe producing electricity for sale.

(2) For a unit that qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity and continues to qualify as a cogeneration unit, a cogeneration unit serving at any time a generator with nameplate capacity of more than 25 MWe and supplying in any calendar year more than one-third of the unit's potential electric output capacity or 219,000 MWh, whichever is greater, to any utility power distribution system for sale. If a unit qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity but subsequently no longer qualifies as a cogeneration unit, the unit shall be subject to paragraph (1) of this definition starting on the day on which the unit first no longer qualifies as a cogeneration unit.

Fossil fuel means natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material.

Fossil-fuel-fired means, with regard to a unit, combusting any amount of fossil fuel in any calendar year.

Generator means a device that produces electricity.

Maximum design heat input means:

(1) Starting from the initial installation of a unit, the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis as specified by the manufacturer of the unit;

(2)(i) Except as provided in paragraph (2)(ii) of this definition, starting from the completion of any subsequent physical change in the unit resulting in an increase in the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis, such increased maximum amount as specified by the person conducting the physical change; or

(ii) For purposes of applying the definition of the term "potential electrical output capacity," starting from the completion of any subsequent physical change in the unit resulting in a decrease in the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis, such decreased maximum amount as specified by the person conducting the physical change.

NAAQS means National Ambient Air Quality Standard.

Nameplate capacity means, starting from the initial installation of a generator, the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other deratings) as specified by the manufacturer of the generator or, starting from the completion of any subsequent physical change in the generator resulting in an increase in the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other

NMED Exhibit 7f

deratings), such increased maximum amount as specified by the person conducting the physical change.

Non-EGU means a source of SO_2 emissions that is not an EGU.

Potential electrical output capacity means 33 percent of a unit's maximum design heat input, divided by 3,413 Btu/kWh, divided by 1,000 kWh/MWh, and multiplied by 8,760 hr/yr.

Sequential use of energy means:

(1) For a topping-cycle cogeneration unit, the use of reject heat from electricity production in a useful thermal energy application or process; or

(2) For a bottoming-cycle cogeneration unit, the use of reject heat from useful thermal energy application or process in electricity production.

Topping-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful power, including electricity, and at least some of the reject heat from the electricity production is then used to provide useful thermal energy.

Total energy input means, with regard to a cogeneration unit, total energy of all forms supplied to the cogeneration unit, excluding energy produced by the cogeneration unit itself.

Total energy output means, with regard to a cogeneration unit, the sum of useful power and useful thermal energy produced by the cogeneration unit.

Unit means a stationary, fossil-fuel-fired boiler or a stationary, fossil-fuel fired combustion turbine.

Useful power means, with regard to a cogeneration unit, electricity or mechanical energy made available for use, excluding any such energy used in the power production process (which process includes, but is not limited to, any on-site processing or treatment of fuel combusted at the unit and any on-site emission controls).

Useful thermal energy means, with regard to a cogeneration unit, thermal energy that is:

(1) Made available to an industrial or commercial process, excluding any heat contained in condensate return or makeup water;

(2) Used in a heat application (*e.g.*, space heating or domestic hot water heating); or

(3) Used in a space cooling application (*i.e.*, thermal energy used by an absorption chiller).

Utility power distribution system means the portion of an electricity grid owned or operated by a utility and dedicated to delivering electricity to customers.

■ 6. Part 51 is amended by adding § 51.125 to Subpart G to read as follows:

§ 51.125 Emissions reporting requirements for SIP revisions relating to budgets for SO_2 and NO_X emissions.

(a) For its transport SIP revision under § 51.123 and/or 51.124, each State must submit to EPA SO_2 and/or NO_X emissions data as described in this section.

(1) Alabama, Florida, Georgia, Illinois, Indiana, Iowa, Kentucky, Louisiana, Maryland, Michigan, Minnesota, Mississippi, Missouri, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Texas, Virginia, West Virginia, Wisconsin and the District of Columbia, must report annual (12 months) emissions of SO_2 and NO_X.

(2) Alabama, Arkansas, Connecticut, Deleware, Florida, Illinois, Indinia, Iowa, Kentucky, Lousianna, Maryland, Massachusetts, Michigan, Mississippi, Missouri, New Jersey, New York, North Carolina, Ohio, Pennsylvania, South Carolina, Tennessee, Virginia, West Virginia, Wisconsin and the District of Columbia must report ozone season (May 1 through September 30) emissions of NO_X.

(b) Each revision must provide for periodic reporting by the State of SO_2 and/or NO_X emissions data as specified in paragraph (a) of this section to demonstrate whether the State's emissions are consistent with the projections contained in its approved SIP submission.

(1) Every-year reporting cycle. As applicable, each revision must provide for reporting of SO_2 and NO_X emissions data every year as follows:

(i) The States identified in paragraph (a)(1) of this section must report to EPA annual emissions data every year from all SO_2 and NO_X sources within the State for which the State specified control measures in its SIP submission under §§ 51.123 and/or 51.124.

(ii) The States identified in paragraph (a)(2) of this section must report to EPA ozone season and summer daily emissions data every year from all NO_X sources within the State for which the State specified control measures in its SIP submission under § 51.123.

(iii) If sources report SO_2 and NO_X emissions data to EPA in a given year pursuant to a trading program approved under § 51.123(o) or § 51.124(o) of this part or pursuant to the monitoring and reporting requirements of 40 CFR part 75, then the State need not provide annual reporting of these pollutants to EPA for such sources.

(2) *Three-year reporting cycle.* As applicable, each plan must provide for triennial (*i.e.*, every third year) reporting of SO_2 and NO_X emissions data from all sources within the State.

(i) The States identified in paragraph (a)(1) of this section must report to EPA annual emissions data every third year from all SO_2 and NO_X sources within the State.

(ii) The States identified in paragraph (a)(2) of this section must report to EPA ozone season and ozone daily emissions data every third year from all NO_X sources within the State.

(3) The data availability requirements in § 51.116 must be followed for all data submitted to meet the requirements of paragraphs (b)(1) and (2) of this section.

(c) The data reported in paragraph (b) of this section must meet the requirements of subpart A of this part.

(d) Approval of annual and ozone season calculation by EPA. Each State must submit for EPA approval an example of the calculation procedure used to calculate annual and ozone season emissions along with sufficient information for EPA to verify the calculated value of annual and ozone season emissions.

(e) *Reporting schedules.* (1) Reports are to begin with data for emissions occurring in the year 2008, which is the first year of the 3-year cycle.

(2) After 2008, 3-year cycle reports are to be submitted every third year and every-year cycle reports are to be submitted each year that a triennial report is not required.

(3) States must submit data for a required year no later than 17 months after the end of the calendar year for which the data are collected.

(f) Data reporting procedures are given in subpart A of this part. When submitting a formal NO_X budget emissions report and associated data, States shall notify the appropriate EPA Regional Office.

(g) *Definitions.* (1) As used in this section, "ozone season" is defined as follows:

Ozone season.—The five month period from May 1 through September 30.

(2) Other words and terms shall have the meanings set forth in appendix A of subpart A of this part.

PART 72—PERMITS REGULATION

■ 1. The authority citation for part 72 continues to read as follows:

Authority: 42 U.S.C. 7601 and 7651, *et seq.*

§ 72.2 [Amended]

■ 2. Section 72.2 is amended by:

■ a. Amend the definition of "Acid rain emissions limitation" by replacing, in paragraph (1)(i), the words "an affected unit" with the words "the affected units

NMED Exhibit 7f

at a source'' and replacing, in paragraph (1)(ii)(C), the words ''compliance subaccount for that unit'' with the words ''compliance account for that source'';

■ b. Amend the definition of ''Advance allowance'' by replacing the word ''unit's'' with the word ''source'';

■ c. Amend the definition of ''Allocate or allocation'' by replacing the words ''unit account'' with the words ''compliance account'';

■ d. Amend the definition of ''Allowance deduction, or deduct'' by replacing the words ''compliance subaccount, or future year subaccount,'' with the words ''compliance account'' and replacing the words ''from an affected unit'' with the words ''from the affected units at an affected source'';

■ e. Amend the definition of ''Allowance transfer deadline'' by replacing the words ''affected unit's compliance subaccount'' with the words ''an affected source's compliance account'' and replacing the words ''the unit's'' with the words ''the source's'';

■ f. Amend the definition of ''Authorized account representative'' by replacing the words ''unit account'' with the words ''compliance account'' and replacing the words ''affected unit'' with the words ''affected source and the affected units at the source'';

■ g. Amend the definition of ''Compliance use date'' by replacing the word ''unit's'' with the word ''source's'';

■ h. Amend the definition of ''Excess emissions'' by, in paragraph (1), replacing the words ''an affected unit'' with the words ''the affected units at an affected source'' and replacing the words ''for the unit'' with the words ''for the source'';

■ i. Amend the definition of ''General account'' by replacing the words ''unit account'' with the words ''compliance account'';

■ j. Amend the definition of ''Offset Plan'' by replacing the word ''unit'' with the word ''source'';

■ k. Amend the definition of ''Recordation, record, or recorded'' by removing the words ''or subaccount'';

■ l. Amend the definition of ''Source'' by replacing the words ''under the Act.'' with the words ''under the Act, provided that one or more combustion or process sources that have, under § 74.4(c) of this chapter, a different designated representative than the designated representative for one or more affected utility units at a source shall be treated as being included in a separate source from the source that includes such utility units for purposes of parts 72 through 78 of this chapter, but shall be treated as being included in the same source as the source that includes such utility units for purposes of section 502(c) of the Act.''

■ m. Amend the definition of ''Spot allowance'' by replacing the word ''unit's'' with the word ''source's''; and

■ n. Revise the definition of ''Cogeneration unit'';

■ o. Add a new definition of ''Compliance account''; and

■ p. Remove the definitions of ''Compliance subaccount'', ''Current year subaccount'', ''Direct Sale Subaccount'', ''Future year subaccount'', and ''Unit account''.

§ 72.2 Definitions.

* * * * *

Cogeneration unit means a unit that has equipment used to produce electric energy and forms of useful thermal energy (such as heat or steam) for industrial, commercial, heating, or cooling purposes, through sequential use of energy.

* * * * *

Compliance account means an Allowance Tracking System account, established by the Administrator under § 73.31(a) or (b) of this chapter or § 74.40(a) of this chapter for an affected source and for each affected unit at the source.

* * * * *

§ 72.7 [Amended]

■ 3. Section 72.7 is amended in paragraph (c)(1)(ii), in the first sentence, by replacing the word ''unit's Allowance Tracking System account'' with the words ''compliance account of the source that includes the unit'', and by removing the third sentence of paragraph (c)(1)(ii).

§ 72.9 [Amended]

■ 4. Section 72.9 is amended by:

■ a. In paragraph (b)(2), replace the word ''unit'' with the words ''source or unit, as appropriate,'';

■ b. In paragraph (c)(1)(i), replace the words ''unit's compliance subaccount'' with the words ''source's compliance account'' and replace the words ''from the unit'' with the words ''from the affected units at the source'';

■ c. In paragraphs (e)(1) and (e)(2) introductory text, replace the words ''an affected unit'' with the words ''an affected source'';

■ d. In paragraph (g)(6), remove the second sentence; and

■ e. In paragraph (h)(2), replace the word ''unit'' with the word ''source'' wherever it appears.

§ 72.21 [Amended]

■ 5. Section 72.21 is amended by:

■ a. In paragraph (b)(1), remove the word ''affected'' wherever it appears; and

■ b. In paragraph (e)(2), replace the words ''unit account'' with the words ''compliance account''.

§ 72.24 [Amended]

■ 6. Section 72.24 is amended by removing and reserving paragraphs (a)(5), (a)(7), and (a)(10).

§ 72.40 [Amended]

■ 7–8. Section 72.40 is amended, in paragraph (a)(1), replace the words ''unit's compliance subaccount'' with the words ''compliance account of the source where the unit is located''; remove the words '', or in the compliance subaccount of another affected unit at the source to the extent provided in § 73.35(b)(3),''; and replace the words ''from the unit'' with the words ''from the affected units at the source''.

§ 72.72 [Amended]

■ 9. Section 72.72 is amended by:

■ a. In paragraph (a)(1), add the words ''or affected source'' after the words ''affected unit'';

■ b. In paragraph (a)(2), add the words ''or an affected source's'' after the words ''affected unit's''; and

■ c. In paragraph (a)(3), add the words ''or affected source'' after the words ''affected unit'' whenever they appear.

§ 72.73 [Amended]

■ 10. Section 72.73 is amended in paragraph (b)(2) by replacing the words ''the first Acid Rain permit'' with the words ''an Acid Rain permit''.

§ 72.90 [Amended]

■ 11. Section 72.90 is amended by, in paragraph (a), add, after the words ''each calendar year'', the words ''during 1995 through 2005''.

§ 72.95 [Amended]

■ 12. Section 72.95 is amended by:

■ a. In the introductory text, replace the words ''an affected unit's compliance subaccount'' with the words ''an affected source's compliance account''; and

■ b. In paragraph (a), replace the words ''by the unit'' with the words ''by the affected units at the source''.

§ 72.96 [Amended]

■ 13. Section 72.96 is amended in paragraph (b), by replacing the words ''unit''s Allowance Tracking System account'' with the words ''source's compliance account''.

PART 73—SULFUR DIOXIDE ALLOWANCE SYSTEM

■ 1. The authority citation for part 73 continues to read as follows:

Authority: 42 U.S.C. 7601 and 7651, *et seq.*

NMED Exhibit 7f

§ 73.10 [Amended]

■ 2. Section 73.10 is amended by:

■ a. In paragraph (a), replace the words ''unit account for each'' with the words ''compliance account for each source that includes a'' and remove the words ''in each future year subaccount''; and

■ b. In paragraphs (b)(1) and (b)(2), replace the words ''unit account for each'' with the words ''compliance account for each source that includes a'' and replace the words ''in the future year subaccounts representing calendar years'' with the words ''for the years''.

§ 73.27 [Amended]

■ 3. Section 73.27 is amended in paragraphs (c)(3) and (c)(5) by replacing the words ''unit's Allowance Tracking System account'' with the words ''compliance account of the source that includes the unit''.

§ 73.30 [Amended]

■ 4. Section 73.30 is amended by:

■ a. In paragraph (a), add the word ''compliance'' after the word ''establish''; replace the words ''affected units'' with the words ''affected sources''; and replace the words ''unit's Allowance Tracking System account'' with the words ''source's compliance account''; and

■ b. In paragraph (b), replace the word ''unit'' with the word ''source'' and replace the words ''Allowance Tracking System account'' with the words ''general account''.

§ 73.31 [Amended]

■ 5. Section 73.31 is amended by:

■ a. In paragraph (a), replace the words ''an Allowance Tracking System account'' with the words ''a compliance account'' and replace the words ''each unit'' with the words ''each source that includes a unit'';

■ b. In paragraph (b), replace the words ''an Allowance Tracking System account for the unit.'' with the words ''a compliance account for the source that includes the unit, unless the source already has a compliance account.''; and

■ c. In paragraph (c)(1)(v), replace the words ''Allowance Tracking System account'' with the words ''general account'' and remove the words ''I shall abide by any fiduciary responsibilities assigned pursuant to the binding agreement.''.

§ 73.32 [Removed and Reserved]

■ 6. Section 73.32 is removed and reserved.

§ 73.33 [Amended]

■ 7. Section 73.33 is amended by removing and reserving paragraphs (b) and (c).

§ 73.34 [Amended]

■ 8. Section 73.34 is amended by:

■ a. Revise paragraphs (a) and (b) to read as set forth below;

■ b. In paragraph (c) introductory text, remove the paragraph heading and replace the words ''compliance, current year, and future year'' with the words ''compliance account and general account''.

§ 73.34 Recordation in accounts.

(a) After a compliance account is established under § 73.31(a) or (b), the Administrator will record in the compliance account any allowance allocated to any affected unit at the source for 30 years starting with the later of 1995 or the year in which the compliance account is established and any allowance allocated for 30 years starting with the later of 1995 or the year in which the compliance account is established and transferred to the source with the transfer submitted in accordance with § 73.50. In 1996 and each year thereafter, after Administrator has completed the deductions pursuant to § 73.35(b), the Administrator will record in the compliance account any allowance allocated to any affected unit at the source for the new 30th year (*i.e.*, the year that is 30 years after the calendar year for which such deductions are made) and any allowance allocated for the new 30th year and transferred to the source with the transfer submitted in accordance with § 73.50.

(b) After a general account is established under § 73.31(c), the Administrator will record in the general account any allowance allocated for 30 years starting with the later of 1995 or the year in which the general account is established and transferred to the general account with the transfer submitted in accordance with § 73.50. In 1996 and each year thereafter, after the Administrator has completed the deductions pursuant to § 73.35(b), the Administrator will record in the general account any allowance allocated for the new 30th year (*i.e.*, the year that is 30 years after the calendar year for which such deductions are made) and transferred to the general account with the transfer submitted in accordance with § 73.50.

* * * * *

§ 73.35 [Amended]

■ 9. Section 73.35 is amended by:

■ a. In paragraph (a) introductory text and paragraph (a)(1), replace the words ''unit's'' with the word ''source's'';

■ b. In paragraph (a)(2), replace the word ''Such'' with the word ''The'';

■ c. In paragraph (a)(2)(i), replace the words ''the unit's compliance subaccount'' with the words ''the source's compliance account'';

■ d. In paragraph (a)(2)(ii), replace the words ''the unit's compliance subaccount'' with the words ''the source's compliance account'', replace the words ''compliance subaccount for the unit'' with the words ''source's compliance account'', and replace the word ''or'' with the word ''and'';

■ e. Remove paragraph (a)(2)(iii);

■ f. Add a new paragraph (a)(3);

■ g. In paragraph (b)(1), replace the words ''compliance subaccount'' with the words ''compliance account'', add the words ''available for deduction under paragraph (a) of this section'' after the words ''deduct allowances'', and replace the words ''each affected unit's compliance subaccount'' with the words ''each affected source's compliance account'';

■ h. In paragraph (b)(2), replace the words ''allowances remain in the compliance subaccount'' with the words ''allowances available for deduction under paragraph (a) of this section remain in the compliance account'';

■ i. Remove paragraph (b)(3);

■ j. Revise paragraph (c)(1) to read as set forth below;

■ k. In paragraph (c)(2), replace the words ''for the unit'' with the words ''for the units at the source'', replace the words ''in its compliance subaccount.'' with the words ''in the source's compliance account.'', replace the words ''from the compliance subaccount'' with the words ''from the compliance account'', and replace the words ''unit's compliance subaccount'' with the words ''source's compliance account'';

■ l. In paragraph (d), replace the words ''for each unit'' with the words ''for each source'' and replace the word ''unit's'' with the word ''source's''; and

■ m. Remove paragraph (e).

§ 73.35 Compliance.

(a) * * *

(3) The allowance was not previously deducted by the Administrator in accordance with a State SO_2 mass emissions reduction program under § 51.124(o) of this chapter or otherwise permanently retired in accordance with § 51.124(p) of this chapter.

* * * * *

(c)(1) *Identification of allowances by serial number.* The authorized account representative for a source's compliance account may request that specific allowances, identified by serial number, in the compliance account be deducted for a calendar year in accordance with paragraph (b) or (d) of this section. Such request shall be submitted to the

NMED Exhibit 7f

Administrator by the allowance transfer deadline for the year and include, in a format prescribed by the Administrator, the identification of the source and the appropriate serial numbers.

* * * * *

§ 73.36 [Amended]

■ 10. Section 73.36 is amended by:
■ a. In paragraph (a), replace the words ''Unit accounts.'' with the words ''Compliance accounts.'' and replace with words ''compliance subaccount'' with the words ''compliance account'' whenever they appear; and
■ b. In paragraph (b), replace the words ''current year subaccount'' with the words ''general account'' whenever they appear and replace the words ''at the end of the current calendar year'' with the words ''not transferred pursuant to subpart D to another Allowance Tracking System account''.
■ 11. Section 73.37 is revised to read as follows:

§ 73.37 Account error.

The Administrator may, at his or her sole discretion and on his or her own motion, correct any error in any Allowance Tracking System account. Within 10 business days of making such correction, the Administrator will notify the authorized account representative for the account.

§ 73.38 [Amended]

■ 12. Section 73.38 is amended by:
■ a. In paragraph (a), replace the words ''delete the general account from the Allowance Tracking System.'' with the words ''close the general account.''; and
■ b. In paragraph (b), replace the words ''for a period of a year or more'' with the words ''for a 12-month period or longer''; remove the words ''in its subaccounts''; replace the words ''will notify'' with the words ''may notify''; remove the words ''and eliminated from the Allowance Tracking System''; and remove the last sentence.

§ 73.50 [Amended]

■ 13. Section 73.50 is amended by:
■ a. In paragraph (a), remove the words '', including, but not limited to, transfers of an allowance to and from contemporaneous future year subaccounts, and transfers of an allowance to and from compliance subaccounts and current year subaccounts, and transfers of all allowances allocated for a unit for each calendar year in perpetuity'';
■ b. In paragraph (b)(1)(ii), remove the words '', or correct indication on the allowance transfer where a request involves the transfer of the unit's allowance in perpetuity'';
■ c. In paragraph (b)(2)(ii), remove the words ''Allowance Tracking System'' and ''under 40 CFR part 73, or any other remedies'' and remove the comma after the words ''under State or Federal law''; and
■ d. Remove paragraph (b)(3).

§ 73.51 [Removed and Reserved]

■ 14. Section 73.51 is removed and reserved.

§ 73.52 [Amended]

■ 15. Section 73.52 is amended by:
■ a. In paragraph (a) introductory text, remove the words ''§ 73.50, § 73.51, and'' and add the words ''(or longer as necessary to perform a transfer in perpetuity of allowances allocated to a unit)'' after the words ''five business days'';
■ b. Revise paragraphs (a)(1), (a)(2) and (a)(3);
■ c. Remove paragraph (a)(4);
■ d. Revise paragraph (b); and
■ e. Add a new paragraph (c) to read as follows:

§ 73.52 EPA recordation.

(a) * * *

(1) The transfer is correctly submitted under § 73.50;

(2) The transferor account includes each allowance identified by serial number in the transfer; and

(3) If the allowances identified by serial number specified pursuant to § 73.50(b)(1)(ii) are subject to the limitation on transfer imposed pursuant to § 72.44(h)(1)(i) of this chapter, §74.42 of this chapter, or § 74.47(c) of this chapter, the transfer is in accordance with such limitation.

(b) To the extent an allowance transfer submitted for recordation after the allowance transfer deadline includes allowances allocated for any year before the year in which the allowance transfer deadline occurs, the transfer of such allowance will not be recorded until after completion of the deductions pursuant to § 73.35(b) for year before the year in which the allowance transfer deadline occurs.

(c) Where an allowance transfer submitted for recordation fails to meet the requirements of paragraph (a) of this section, the Administrator will not record such transfer.

§ 73.70 [Amended]

■ 16. Section 73.70 is amended by:
■ a. In paragraph (e), remove the last two sentences.
■ b. In paragraph (f), replace the words ''the subaccount'' by the words ''the Allowance Tracking System account''; and
■ c. In paragraph (i)(1), add the words ''source that includes a'' after the words ''Allowance Tracking System account of each''.

PART 74—SULFUR DIOXIDE OPT-INS

■ 1. The authority citation for part 74 continues to read as follows:

Authority: 42 U.S.C. 7601 and 7651, *et seq.*

§ 74.4 [Amended]

■ 2. Section 74.4 is amended by:
■ a. In paragraph (c)(1), replace the words ''a combustion or process source that is located'' with the words ''one or more combustion or process sources that are located'', replace the words ''such combustion or process source and thereafter, does'' with the words ''such combustion or process sources and thereafter, do'', and replace the words ''designate, for such combustion or process source'' with the words ''designate, for such combustion or process sources''; and
■ b. In paragraph (c)(2), replace the words ''the combustion or process source'' with the words ''the combustion or process sources'' whenever they occur and replace the word ''meets'' with the word ''meet'' in the first sentence.

§ 74.18 [Amended]

■ 3. Section 74.18 is amended in paragraph (d) by removing the last sentence.

§ 74.40 [Amended]

■ 4. Section 74.40 is amended by:
■ a. In paragraph (a), replace the words ''an opt-in account'' with the words ''a compliance account'', replace the words ''an account'' with the words ''a compliance account (unless the source that includes the opt-in source already has a compliance account or the opt-in source has, under § 74.4(c), a different designated representative than the designated representative for the source)'', and remove the last sentence.
■ b. In paragraph (b), replace the words ''allowance account in the Allowance Tracking System'' with the words ''compliance account (unless the source that includes the opt-in source already has a compliance account or the opt-in source has, under § 74.4(c), a different designated representative than the designated representative for the source)''.
■ 5. Section 74.42 is revised to read as follows:

§ 74.42 Limitation on transfers.

(a) With regard to a transfer request submitted for recordation during the period starting January 1 and ending with the allowance transfer deadline in the same year, the Administrator will not record a transfer of an opt-in

NMED Exhibit 7f

allowance that is allocated to an opt-in source for the year in which the transfer request is submitted or a subsequent year.

(b) With regard to a transfer request during the period starting with the day after an allowance transfer deadline and ending December 31 in the same year, the Administrator will not record a transfer of an opt-in allowance that is allocated to an opt-in source for a year after the year in which the transfer request is submitted.

§ 74.43 [Amended]

■ 6. Section 74.43 is amended by:
■ a. In paragraph (a), remove the words "in lieu of any annual compliance certification report required under subpart I of part 72 of this chapter";
■ b. In paragraph (b)(7), replace the word "At" with the words, "In an annual compliance certification report for a year during 1995 through 2005, at"; and
■ c. In paragraph (b)(8), replace the word "The" with the words, "In an annual compliance certification report for a year during 1995 through 2005, the".

§ 74.44 [Amended]

■ 7. Section 74.44 is amended by:
■ a. In paragraph (c)(1)(ii), remove the words "opt-in source's" and add the words "of the source that includes the opt-in source" after the word "System";
■ b. In paragraphs (c)(2)(iii)(C), (c)(2)(iii)(D), (c)(2)(iii)(E) introductory text, and (c)(2)(iii)(E)(3), replace the words "opt-in source's compliance subaccount" with the words "compliance account of the source that includes the opt-in source" whenever they occur; and
■ c. In paragraph (c)(2)(iii)(F), replace the words "opt-in source's compliance subaccount" with the words "compliance account of the source that includes the opt-in source" and replace the words "source's compliance subaccount" with the words "compliance account of the source that includes the opt-in source".

§ 74.46 [Amended]

■ 8. Section 74.46 is amended by removing and reserving paragraph (b)(2).

§ 74.47 [Amended]

■ 9. Section 74.47 is amended by:
■ a. In paragraph (a)(3)(iv), remove the words "opt-in source's" and add the words "of the source that includes the opt-in source" after the word "System";
■ b. In paragraph (a)(3)(v), replace the word "Each" with the word "The", remove the words "replacement unit's" and "(ATS)", and add the words "of each source that includes a replacement unit" after the word "System";
■ c. In paragraph (a)(6), replace the words "Allowance Tracking System account of each replacement unit" with the words "compliance account of each source that includes a replacement unit";
■ d. In paragraph (c), replace the words "unit account" with the words "compliance account of the source that includes the replacement unit" and replace the words "account in the Allowance Tracking System" with the words "Allowance Tracking System account";
■ e. In paragraph (d)(1)(ii)(C), remove the words "opt-in source's" and "(ATS)" and add the words "of the source that includes the opt-in source" after the word "System";
■ f. In paragraph (d)(1)(ii)(D), replace the words "(ATS) for each" with the words "of each source that includes a";
■ g. In paragraph (d)(2)(i), replace the words "Allowance Tracking System accounts for the opt-in source and for each replacement unit" with the words "compliance account for each source that includes the opt-in source or a replacement unit";
■ h. In paragraph (d)(2)(i)(B), replace the words "Allowance Tracking System account of the opt-in source" with the words "compliance account of the source that includes the opt-in source"; and
■ i. In paragraph (d)(2)(ii), replace the words "Allowance Tracking System accounts for the opt-in source and for each replacement unit" with the words "compliance account for each source that includes the opt-in source or a replacement unit".

§ 74.49 [Amended]

■ 10. Section 74.49 is amended, in paragraph (a) introductory text, by replacing the words "an opt-in source's compliance subaccount" with the words "the compliance account of a source that includes an opt-in source".

§ 74.50 [Amended]

■ 11. Section 74.50 is amended by:
■ a. In paragraph (a)(2) introductory text, add the words "source that includes" after the words "the account of the";
■ b. In paragraph (a)(2)(i), replace the words "opt-in source's compliance subaccount" with the words "the compliance account of the source that includes the opt-in source"; and
■ c. In paragraph (b), replace the words "the opt-in source's unit account" with the words "the compliance account of the source that includes the opt-in source"; and
■ d. In paragraph (d), replace the words "an opt-in source does not hold" with the words "the source that includes the opt-in source does not hold".

PART 77—EXCESS EMISSIONS

■ 1. The authority citation for part 77 continues to read as follows:

Authority: 42 U.S.C. 7601 and 7651, *et seq.*

§ 77.3 [Amended]

■ 2. Section 77.3 is amended by:
■ a. In paragraph (a), replace the words "affected unit" with the words "affected source" and replace the word "unit's Allowance Tracking System account" with the words "source's compliance account";
■ b. In paragraphs (b) and (c), replace the word "unit" with the word "source" wherever it appears; and
■ c. In paragraph (d) introductory text and paragraphs (d)(1) and (d)(2), replace the word "unit" with the word "source" whenever it appears;
■ d. In paragraphs (d)(3) and (d)(4), replace the words "unit's Allowance Tracking System account" with the words "source's compliance account's" whenever they appear; and
■ e. In paragraph (d)(5), replace the words "unit's compliance subaccount" with the words "source's compliance account".

§ 77.4 [Amended]

■ 3. Section 77.4 is amended by:
■ a. In paragraph (b)(1), replace the words "unit's compliance subaccount" with the words "source's compliance account"; and
■ b. In paragraphs (c)(1)(ii)(A), (d)(1), (d)(2), (d)(3), (e)(iv), (g)(2)(ii), (g)(3)(ii), and (g)(3)(iii), replace the word "unit" with the word "source"; and
■ c. In paragraph (k)(2), replace the words "unit's compliance subaccount" with the words "source's compliance account" and replace the word "unit" with the word "source".

§ 77.5 [Amended]

■ 4. Section 77.5 is amended by:
■ a. In paragraph (b), replace the words "compliance subaccount" with the words "compliance account";
■ b. In paragraph (c), replace the words ", from the unit's compliance subaccount" with the words "allocated for the year after the year in which the source has excess emissions, from the source's compliance account", and replace the word "unit's" with the word "source's"; and
■ c. Remove paragraph (d).

§ 77.6 [Amended]

■ 5. Section 77.6 is amended by:
■ a. In paragraph (a)(1), add the words "occur at the affected source" after the

words ''sulfur dioxide'' and replace the words ''owners and operators of the affected unit'' with the words ''owners and operators respectively of the affected source and the affected units at the source or of the affected unit'';

■ b. In paragraph (b)(1)(i)(A), replace the word ''unit'' with the words ''source or unit as appropriate''; and

■ c. In paragraphs (b)(3),(c), and (f), replace the word ''unit'' with the words ''source or unit as appropriate''.

PART 78—APPEAL PROCEDURES

■ 1. The title of part 78 is revised to read as set forth above.

■ 2. The authority citation for part 78 continues to read as follows:

Authority: 42 U.S.C. 7401, 7403, 7410, 7426, 7601, and 7651, *et seq.*

§ 78.1 [Amended]

■ 3. Section 78.1 is amended by:

■ a. In paragraph (a)(1), replace the words ''parts 72, 73, 74, 75, 76, or 77 of this chapter or part 97 of this chapter'' with the words ''part 72, 73, 74, 75, 76, or 77 of this chapter, subparts AA through II of part 96 of this chapter, subparts AAA through III of part 96 of this chapter, and subparts AAAA through subparts IIII of part 96 of this chapter, or part 97 of this chapter'';

■ b. Revise paragraph (b)(2)(i);

■ c. Add new paragraphs (b)(7), (b)(8), and (b)(9) to read as follows:

§ 78.1 Purpose and scope.

* * * * *

(b) * * *

(2) * * *

(i) The correction of an error in an Allowance Tracking System account;

* * * * *

(7) Under subparts AA through II of part 96 of this chapter,

(i) The decision on the allocation of CAIR NO_X allowances under § 96.141(b)(2) or (c)(2) of this chapter.

(ii) The decision on the deduction of CAIR NO_X allowances, and the adjustment of the information in a submission and the decision on the deduction or transfer of CAIR NO_X allowances based on the information as adjusted, under § 96.154 of this chapter;

(iii) The correction of an error in a CAIR NO_X Allowance Tracking System account under § 96.156 of this chapter;

(iv) The decision on the transfer of CAIR NO_X allowances under § 96.161 of this chapter;

(v) The finalization of control period emissions data, including retroactive adjustment based on audit;

(vi) The approval or disapproval of a petition under § 96.175 of this chapter.

(8) Under subparts AAA through III of part 96 of this chapter,

(i) The decision on the deduction of CAIR SO_2 allowances, and the adjustment of the information in a submission and the decision on the deduction or transfer of CAIR SO_2 allowances based on the information as adjusted, under § 96.254 of this chapter;

(ii) The correction of an error in a CAIR SO_2 Allowance Tracking System account under § 97.256 of this chapter;

(iii) The decision on the transfer of CAIR SO_2 allowances under § 96.261 of this chapter;

(iv) The finalization of control period emissions data, including retroactive adjustment based on audit;

(v) The approval or disapproval of a petition under § 96.275 of this chapter.

(9) Under subparts AAAA through IIII of part 96 of this chapter,

(i) The decision on the allocation of CAIR NO_X Ozone Season allowances under § 96.341(b)(2) or (c)(2)of this chapter.

(ii) The decision on the deduction of CAIR NO_X Ozone Season allowances, and the adjustment of the information in a submission and the decision on the deduction or transfer of CAIR NO_X Ozone Season allowances based on the information as adjusted, under § 96.354 of this chapter;

(iii) The correction of an error in a CAIR NO_X Ozone Season Allowance Tracking System account under § 96.356 of this chapter;

(iv) The decision on the transfer of CAIR NO_X Ozone Season allowances under § 96.361;

(v) The finalization of control period emissions data, including retroactive adjustment based on audit;

(vi) The approval or disapproval of a petition under § 96.375 of this chapter.

* * * * *

§ 78.3 [Amended]

■ 4. Section 78.3 is amended by:

■ a. In paragraph (b)(3)(i), add the words ''or the CAIR designated representative or CAIR authorized account representative under paragraph (a)(4), (5), or (6) of this section (unless the CAIR designated representative or CAIR authorized account representative is the petitioner)'' after the words ''(unless the NO_X authorized account representative is the petitioner)'';

■ b. In paragraph (c)(7), replace the words ''or part 97 of this chapter, as appropriate'' with the words '', subparts AA through II of part 96 of this chapter, subparts AAA through III of part 96 of this chapter, subparts AAAA through IIII of part 96 of this chapter, or part 97 of this chapter, as appropriate'';

■ c. In paragraph (d)(3), add the words ''or on an account certificate of representation submitted by a CAIR designated representative or an application for a general account submitted by a CAIR authorized account representative under subparts AA through II, subparts AAA through III, or subparts AAAA through IIII of part 96 of this chapter'' after the words ''under the NO_X Budget Trading Program'';

■ d. Add new paragraphs (a)(4), (a)(5), (a)(6), (d)(5), (d)(6), and (d)(7) to read as follows:

§ 78.3 Petition for administrative review and request for evidentiary hearing.

(a) * * *

(4) The following persons may petition for administrative review of a decision of the Administrator that is made under subparts AA through II of part 96 of this chapter and that is appealable under § 78.1(a):

(i) The CAIR designated representative for a unit or source, or the CAIR authorized account representative for any CAIR NO_X Allowance Tracking System account, covered by the decision; or

(ii) Any interested person.

(5) The following persons may petition for administrative review of a decision of the Administrator that is made under subparts AAA through III of part 96 of this chapter and that is appealable under § 78.1(a):

(i) The CAIR designated representative for a unit or source, or the CAIR authorized account representative for any CAIR SO_2 Allowance Tracking System account, covered by the decision; or

(ii) Any interested person.

(6) The following persons may petition for administrative review of a decision of the Administrator that is made under subparts AAAA through IIII of part 96 of this chapter and that is appealable under § 78.1(a):

(i) The CAIR designated representative for a unit or source, or the CAIR authorized account representative for any CAIR Ozone Season NO_X Allowance Tracking System account, covered by the decision; or

(ii) Any interested person.

* * * * *

(d) * * *

(5) Any provision or requirement of subparts AA through II of part 96 of this chapter, including the standard requirements under § 96.106 of this chapter and any emission monitoring or reporting requirements.

(6) Any provision or requirement of subparts AAA through III of part 96 of this chapter, including the standard requirements under § 96.206 of this

chapter and any emission monitoring or reporting requirements.

(7) Any provision or requirement of subparts AAAA through IIII of part 96 of this chapter, including the standard requirements under § 96.306 of this chapter and any emission monitoring or reporting requirements.

§ 78.4 [Amended]

■ 5. Section 78.4 is amended by adding two new sentences after the fifth sentence in paragraph (a) to read as follows:

§ 78.4 Filings.

(a) * * * Any filings on behalf of owners and operators of a CAIR NO_X, SO_2, or NO_X Ozone Season unit or source shall be signed by the CAIR designated representative. Any filings on behalf of persons with an interest in CAIR NO_X allowances, CAIR SO_2 allowances, or CAIR NO_X Ozone Season allowances in a general account shall be signed by the CAIR authorized account representative. * * *

* * * * *

§ 78.5 [Amended]

■ 6. Section 78.5 is amended, in paragraph (a), by removing the words ", or a claim or error notification was submitted," the words "or in the claim of error notification", and the words "or the period for submitting a claim of error notification".

§ 78.12 [Amended]

■ 7. Section 78.12 is amended by:

■ a. In paragraph (a) introductory text, remove the words ", or to submit a claim of error notification"; and

■ b. In paragraph (a)(2), replace the words "NO_X Budget permit" with the words ", NO_X Budget permit, CAIR permit,".

§ 78.13 [Amended]

■ 8. Section 78.13 is amended by, in paragraph (b), removing the word "also".

PART 96—[AMENDED]

■ 1. Authority citation for Part 96 is revised to read as follows:

Authority: 42 U.S.C. 7401, 7403, 7410, 7601, and 7651, *et seq.*

■ 2. Part 96 is amended by adding subparts AA through II, to read as follows:

Subpart AA—CAIR NO_X Annual Trading Program General Provisions

Sec.

Subpart BB—CAIR Designated Representative for CAIR NO_X Sources

Subpart CC—Permits

Subpart DD—[Reserved]

Subpart EE—CAIR NO_X Allowance Allocations

Subpart FF—CAIR NO_X Allowance Tracking System

Subpart GG—CAIR NO_X Allowance Transfers

Subpart HH—Monitoring and Reporting

Subpart II—CAIR NO_X Opt-in Units

Subpart AA—CAIR NO_X Annual Trading Program General Provisions

§ 96.101 Purpose.

This subpart and subparts BB through II establish the model rule comprising general provisions and the designated representative, permitting, allowance, monitoring, and opt-in provisions for the State Clean Air Interstate Rule (CAIR) NO_X Annual Trading Program, under section 110 of the Clean Air Act and § 51.123 of this chapter, as a means of mitigating interstate transport of fine particulates and nitrogen oxides. The owner or operator of a unit or a source shall comply with the requirements of this subpart and subparts BB through II as a matter of federal law only if the State with jurisdiction over the unit and the source incorporates by reference such subparts or otherwise adopts the requirements of such subparts in accordance with § 51.123(o)(1) or (2) of this chapter, the State submits to the Administrator one or more revisions of the State implementation plan that include such adoption, and the Administrator approves such revisions. If the State adopts the requirements of such subparts in accordance with § 51.123(o)(1) or (2) of this chapter, then the State authorizes the Administrator to assist the State in implementing the CAIR NO_X Annual Trading Program by carrying out the functions set forth for the Administrator in such subparts.

§ 96.102 Definitions.

The terms used in this subpart and subparts BB through II shall have the meanings set forth in this section as follows:

Account number means the identification number given by the Administrator to each CAIR NO_X Allowance Tracking System account.

Acid Rain emissions limitation means a limitation on emissions of sulfur dioxide or nitrogen oxides under the Acid Rain Program.

Acid Rain Program means a multi-state sulfur dioxide and nitrogen oxides air pollution control and emission reduction program established by the Administrator under title IV of the CAA and parts 72 through 78 of this chapter.

Administrator means the Administrator of the United States Environmental Protection Agency or the Administrator's duly authorized representative.

NMED Exhibit 7f

Allocate or allocation means, with regard to CAIR NO_X allowances issued under subpart EE, the determination by the permitting authority or the Administrator of the amount of such CAIR NO_X allowances to be initially credited to a CAIR NO_X unit or a new unit set-aside and, with regard to CAIR NO_X allowances issued under § 96.188, the determination by the permitting authority of the amount of such CAIR NO_X allowances to be initially credited to a CAIR NO_X unit.

Allowance transfer deadline means, for a control period, midnight of March 1, if it is a business day, or, if March 1 is not a business day, midnight of the first business day thereafter immediately following the control period and is the deadline by which a CAIR NO_X allowance transfer must be submitted for recordation in a CAIR NO_X source's compliance account in order to be used to meet the source's CAIR NO_X emissions limitation for such control period in accordance with § 96.154.

Alternate CAIR designated representative means, for a CAIR NO_X source and each CAIR NO_X unit at the source, the natural person who is authorized by the owners and operators of the source and all such units at the source in accordance with subparts BB and II of this part, to act on behalf of the CAIR designated representative in matters pertaining to the CAIR NO_X Annual Trading Program. If the CAIR NO_X source is also a CAIR SO_2 source, then this natural person shall be the same person as the alternate CAIR designated representative under the CAIR SO_2 Trading Program. If the CAIR NO_X source is also a CAIR NO_X Ozone Season source, then this natural person shall be the same person as the alternate CAIR designated representative under the CAIR NO_X Ozone Season Trading Program. If the CAIR NO_X source is also subject to the Acid Rain Program, then this natural person shall be the same person as the alternate designated representative under the Acid Rain Program.

Automated data acquisition and handling system or *DAHS* means that component of the continuous emission monitoring system, or other emissions monitoring system approved for use under subpart HH of this part, designed to interpret and convert individual output signals from pollutant concentration monitors, flow monitors, diluent gas monitors, and other component parts of the monitoring system to produce a continuous record of the measured parameters in the measurement units required by subpart HH of this part.

Boiler means an enclosed fossil- or other-fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

Bottoming-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful thermal energy and at least some of the reject heat from the useful thermal energy application or process is then used for electricity production.

CAIR authorized account representative means, with regard to a general account, a responsible natural person who is authorized, in accordance with subparts BB and II of this part, to transfer and otherwise dispose of CAIR NO_X allowances held in the general account and, with regard to a compliance account, the CAIR designated representative of the source.

CAIR designated representative means, for a CAIR NO_X source and each CAIR NO_X unit at the source, the natural person who is authorized by the owners and operators of the source and all such units at the source, in accordance with subparts BB and II of this part, to represent and legally bind each owner and operator in matters pertaining to the CAIR NO_X Annual Trading Program. If the CAIR NO_X source is also a CAIR SO_2 source, then this natural person shall be the same person as the CAIR designated representative under the CAIR SO_2 Trading Program. If the CAIR NO_X source is also a CAIR NO_X Ozone Season source, then this natural person shall be the same person as the CAIR designated representative under the CAIR NO_X Ozone Season Trading Program. If the CAIR NO_X source is also subject to the Acid Rain Program, then this natural person shall be the same person as the designated representative under the Acid Rain Program.

CAIR NO_X allowance means a limited authorization issued by the permitting authority under subpart EE of this part or § 96.188 to emit one ton of nitrogen oxides during a control period of the specified calendar year for which the authorization is allocated or of any calendar year thereafter under the CAIR NO_X Program. An authorization to emit nitrogen oxides that is not issued under provisions of a State implementation plan that are approved under § 51.123(o)(1) or (2) of this chapter shall not be a CAIR NO_X allowance.

CAIR NO_X allowance deduction or *deduct CAIR NO_X allowances* means the permanent withdrawal of CAIR NO_X allowances by the Administrator from a compliance account in order to account for a specified number of tons of total nitrogen oxides emissions from all CAIR NO_X units at a CAIR NO_X source for a control period, determined in accordance with subpart HH of this part, or to account for excess emissions.

CAIR NO_X Allowance Tracking System means the system by which the Administrator records allocations, deductions, and transfers of CAIR NO_X allowances under the CAIR NO_X Annual Trading Program. Such allowances will be allocated, held, deducted, or transferred only as whole allowances.

CAIR NO_X Allowance Tracking System account means an account in the CAIR NO_X Allowance Tracking System established by the Administrator for purposes of recording the allocation, holding, transferring, or deducting of CAIR NO_X allowances.

CAIR NO_X allowances held or *hold CAIR NO_X allowances* means the CAIR NO_X allowances recorded by the Administrator, or submitted to the Administrator for recordation, in accordance with subparts FF, GG, and II of this part, in a CAIR NO_X Allowance Tracking System account.

CAIR NO_X Annual Trading Program means a multi-state nitrogen oxides air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts AA through II of this part and § 51.123 of this chapter, as a means of mitigating interstate transport of fine particulates and nitrogen oxides.

CAIR NO_X emissions limitation means, for a CAIR NO_X source, the tonnage equivalent of the CAIR NO_X allowances available for deduction for the source under § 96.154(a) and (b) for a control period.

CAIR NO_X Ozone Season source means a source that includes one or more CAIR NO_X Ozone Season units.

CAIR NO_X Ozone Season Trading Program means a multi-state nitrogen oxides air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts AAAA through IIII of this part and § 51.123 of this chapter, as a means of mitigating interstate transport of ozone and nitrogen oxides.

CAIR NO_X Ozone Season unit means a unit that is subject to the CAIR NO_X Ozone Season Trading Program under § 96.304 and a CAIR NO_X Ozone Season opt-in unit under subpart IIII of this part.

CAIR NO_X source means a source that includes one or more CAIR NO_X units.

CAIR NO_X unit means a unit that is subject to the CAIR NO_X Annual Trading Program under § 96.104 and, except for purposes of § 96.105 and

NMED Exhibit 7f

subpart EE of this part, a CAIR NO_X opt-in unit under subpart II of this part.

CAIR permit means the legally binding and federally enforceable written document, or portion of such document, issued by the permitting authority under subpart CC of this part, including any permit revisions, specifying the CAIR NO_X Annual Trading Program requirements applicable to a CAIR NO_X source, to each CAIR NO_X unit at the source, and to the owners and operators and the CAIR designated representative of the source and each such unit.

CAIR SO_2 source means a source that includes one or more CAIR SO_2 units.

CAIR SO_2 Trading Program means a multi-state sulfur dioxide air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts AAA through III of this part and § 51.124 of this chapter, as a means of mitigating interstate transport of fine particulates and sulfur dioxide.

CAIR SO_2 unit means a unit that is subject to the CAIR SO_2 Trading Program under § 96.204 and a CAIR SO_2 opt-in unit under subpart III of this part.

Clean Air Act or *CAA* means the Clean Air Act, 42 U.S.C. 7401, *et seq.*

Coal means any solid fuel classified as anthracite, bituminous, subbituminous, or lignite.

Coal-derived fuel means any fuel (whether in a solid, liquid, or gaseous state) produced by the mechanical, thermal, or chemical processing of coal.

Coal-fired means:

(1) Except for purposes of subpart EE of this part, combusting any amount of coal or coal-derived fuel, alone or in combination with any amount of any other fuel, during any year; or

(2) For purposes of subpart EE of this part, combusting any amount of coal or coal-derived fuel, alone or in combination with any amount of any other fuel, during a specified year.

Cogeneration unit means a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine:

(1) Having equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through the sequential use of energy; and

(2) Producing during the 12-month period starting on the date the unit first produces electricity and during any calendar year after which the unit first produces electricity—

(i) For a topping-cycle cogeneration unit,

(A) Useful thermal energy not less than 5 percent of total energy output; and

(B) Useful power that, when added to one-half of useful thermal energy produced, is not less then 42.5 percent of total energy input, if useful thermal energy produced is 15 percent or more of total energy output, or not less than 45 percent of total energy input, if useful thermal energy produced is less than 15 percent of total energy output.

(ii) For a bottoming-cycle cogeneration unit, useful power not less than 45 percent of total energy input.

Combustion turbine means:

(1) An enclosed device comprising a compressor, a combustor, and a turbine and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine; and

(2) If the enclosed device under paragraph (1) of this definition is combined cycle, any associated heat recovery steam generator and steam turbine.

Commence commercial operation means, with regard to a unit serving a generator:

(1) To have begun to produce steam, gas, or other heated medium used to generate electricity for sale or use, including test generation, except as provided in § 96.105.

(i) For a unit that is a CAIR NO_X unit under § 96.104 on the date the unit commences commercial operation as defined in paragraph (1) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of commercial operation.

(ii) For a unit that is a CAIR NO_X unit under § 96.104 on the date the unit commences commercial operation as defined in paragraph (1) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of commercial operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(2) Notwithstanding paragraph (1) of this definition and except as provided in § 96.105, for a unit that is not a CAIR NO_X unit under § 96.104 on the date the unit commences commercial operation as defined in paragraph (1) of this definition and is not a unit under paragraph (3) of this definition, the unit's date for commencement of commercial operation shall be the date on which the unit becomes a CAIR NO_X unit under § 96.104.

(i) For a unit with a date for commencement of commercial operation as defined in paragraph (2) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of commercial operation.

(ii) For a unit with a date for commencement of commercial operation as defined in paragraph (2) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of commercial operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(3) Notwithstanding paragraph (1) of this definition and except as provided in § 96.184(h) or § 96.187(b)(3), for a CAIR NO_X opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart II of this part, the unit's date for commencement of commercial operation shall be the date on which the owner or operator is required to start monitoring and reporting the NO_X emissions rate and the heat input of the unit under § 96.184(b)(1)(i).

(i) For a unit with a date for commencement of commercial operation as defined in paragraph (3) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of commercial operation.

(ii) For a unit with a date for commencement of commercial operation as defined in paragraph (3) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of commercial operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(4) Notwithstanding paragraphs (1) through (3) of this definition, for a unit not serving a generator producing electricity for sale, the unit's date of commencement of operation shall also be the unit's date of commencement of commercial operation.

Commence operation means:

(1) To have begun any mechanical, chemical, or electronic process, including, with regard to a unit, start-up of a unit's combustion chamber, except as provided in § 96.105.

(i) For a unit that is a CAIR NO_X unit under § 96.104 on the date the unit commences operation as defined in paragraph (1) of this definition and that subsequently undergoes a physical change (other than replacement of the

NMED Exhibit 7f

unit by a unit at the same source), such date shall remain the unit's date of commencement of operation.

(ii) For a unit that is a CAIR NO_X unit under § 96.104 on the date the unit commences operation as defined in paragraph (1) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(2) Notwithstanding paragraph (1) of this definition and except as provided in § 96.105, for a unit that is not a CAIR NO_X unit under § 96.104 on the date the unit commences operation as defined in paragraph (1) of this definition and is not a unit under paragraph (3) of this definition, the unit's date for commencement of operation shall be the date on which the unit becomes a CAIR NO_X unit under § 96.104.

(i) For a unit with a date for commencement of operation as defined in paragraph (2) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of operation.

(ii) For a unit with a date for commencement of operation as defined in paragraph (2) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(3) Notwithstanding paragraph (1) of this definition and except as provided in § 96.184(h) or § 96.187(b)(3), for a CAIR NO_X opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart II of this part, the unit's date for commencement of operation shall be the date on which the owner or operator is required to start monitoring and reporting the NO_X emissions rate and the heat input of the unit under § 96.184(b)(1)(i).

(i) For a unit with a date for commencement of operation as defined in paragraph (3) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of operation.

(ii) For a unit with a date for commencement of operation as defined in paragraph (3) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

Common stack means a single flue through which emissions from 2 or more units are exhausted.

Compliance account means a CAIR NO_X Allowance Tracking System account, established by the Administrator for a CAIR NO_X source under subpart FF or II of this part, in which any CAIR NO_X allowance allocations for the CAIR NO_X units at the source are initially recorded and in which are held any CAIR NO_X allowances available for use for a control period in order to meet the source's CAIR NO_X emissions limitation in accordance with § 96.154.

Continuous emission monitoring system or *CEMS* means the equipment required under subpart HH of this part to sample, analyze, measure, and provide, by means of readings recorded at least once every 15 minutes (using an automated data acquisition and handling system (DAHS)), a permanent record of nitrogen oxides emissions, stack gas volumetric flow rate, stack gas moisture content, and oxygen or carbon dioxide concentration (as applicable), in a manner consistent with part 75 of this chapter. The following systems are the principal types of continuous emission monitoring systems required under subpart HH of this part:

(1) A flow monitoring system, consisting of a stack flow rate monitor and an automated data acquisition and handling system and providing a permanent, continuous record of stack gas volumetric flow rate, in standard cubic feet per hour (scfh);

(2) A nitrogen oxides concentration monitoring system, consisting of a NO_X pollutant concentration monitor and an automated data acquisition and handling system and providing a permanent, continuous record of NO_X emissions, in parts per million (ppm);

(3) A nitrogen oxides emission rate (or NO_X-diluent) monitoring system, consisting of a NO_X pollutant concentration monitor, a diluent gas (CO_2 or O_2) monitor, and an automated data acquisition and handling system and providing a permanent, continuous record of NO_X concentration, in parts per million (ppm), diluent gas concentration, in percent CO_2 or O_2; and NO_X emission rate, in pounds per million British thermal units (lb/mmBtu);

(4) A moisture monitoring system, as defined in § 75.11(b)(2) of this chapter and providing a permanent, continuous record of the stack gas moisture content, in percent H_2O;

(5) A carbon dioxide monitoring system, consisting of a CO_2 pollutant concentration monitor (or an oxygen monitor plus suitable mathematical equations from which the CO_2 concentration is derived) and an automated data acquisition and handling system and providing a permanent, continuous record of CO_2 emissions, in percent CO_2; and

(6) An oxygen monitoring system, consisting of an O_2 concentration monitor and an automated data acquisition and handling system and providing a permanent, continuous record of O_2, in percent O_2.

Control period means the period beginning January 1 of a calendar year and ending on December 31 of the same year, inclusive.

Emissions means air pollutants exhausted from a unit or source into the atmosphere, as measured, recorded, and reported to the Administrator by the CAIR designated representative and as determined by the Administrator in accordance with subpart HH of this part.

Excess emissions means any ton of nitrogen oxides emitted by the CAIR NO_X units at a CAIR NO_X source during a control period that exceeds the CAIR NO_X emissions limitation for the source.

Fossil fuel means natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material.

Fossil-fuel-fired means, with regard to a unit, combusting any amount of fossil fuel in any calendar year.

Fuel oil means any petroleum-based fuel (including diesel fuel or petroleum derivatives such as oil tar) and any recycled or blended petroleum products or petroleum by-products used as a fuel whether in a liquid, solid, or gaseous state.

General account means a CAIR NO_X Allowance Tracking System account, established under subpart FF of this part, that is not a compliance account.

Generator means a device that produces electricity.

Gross electrical output means, with regard to a cogeneration unit, electricity made available for use, including any such electricity used in the power production process (which process includes, but is not limited to, any on-site processing or treatment of fuel combusted at the unit and any on-site emission controls).

Heat input means, with regard to a specified period of time, the product (in mmBtu/time) of the gross calorific value of the fuel (in Btu/lb) divided by 1,000,000 Btu/mmBtu and multiplied by the fuel feed rate into a combustion

NMED Exhibit 7f

device (in lb of fuel/time), as measured, recorded, and reported to the Administrator by the CAIR designated representative and determined by the Administrator in accordance with subpart HH of this part and excluding the heat derived from preheated combustion air, recirculated flue gases, or exhaust from other sources.

Heat input rate means the amount of heat input (in mmBtu) divided by unit operating time (in hr) or, with regard to a specific fuel, the amount of heat input attributed to the fuel (in mmBtu) divided by the unit operating time (in hr) during which the unit combusts the fuel.

Life-of-the-unit, firm power contractual arrangement means a unit participation power sales agreement under which a utility or industrial customer reserves, or is entitled to receive, a specified amount or percentage of nameplate capacity and associated energy generated by any specified unit and pays its proportional amount of such unit's total costs, pursuant to a contract:

(1) For the life of the unit;

(2) For a cumulative term of no less than 30 years, including contracts that permit an election for early termination; or

(3) For a period no less than 25 years or 70 percent of the economic useful life of the unit determined as of the time the unit is built, with option rights to purchase or release some portion of the nameplate capacity and associated energy generated by the unit at the end of the period.

Maximum design heat input means, starting from the initial installation of a unit, the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis as specified by the manufacturer of the unit, or, starting from the completion of any subsequent physical change in the unit resulting in a decrease in the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis, such decreased maximum amount as specified by the person conducting the physical change.

Monitoring system means any monitoring system that meets the requirements of subpart HH of this part, including a continuous emissions monitoring system, an alternative monitoring system, or an excepted monitoring system under part 75 of this chapter.

Most stringent State or Federal NO_X emissions limitation means, with regard to a unit, the lowest NO_X emissions limitation (in terms of lb/mmBtu) that is applicable to the unit under State or Federal law, regardless of the averaging period to which the emissions limitation applies.

Nameplate capacity means, starting from the initial installation of a generator, the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other deratings) as specified by the manufacturer of the generator or, starting from the completion of any subsequent physical change in the generator resulting in an increase in the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other deratings), such increased maximum amount as specified by the person conducting the physical change.

Oil-fired means, for purposes of subpart EE of this part, combusting fuel oil for more than 15.0 percent of the annual heat input in a specified year.

Operator means any person who operates, controls, or supervises a CAIR NO_X unit or a CAIR NO_X source and shall include, but not be limited to, any holding company, utility system, or plant manager of such a unit or source.

Owner means any of the following persons:

(1) With regard to a CAIR NO_X source or a CAIR NO_X unit at a source, respectively:

(i) Any holder of any portion of the legal or equitable title in a CAIR NO_X unit at the source or the CAIR NO_X unit;

(ii) Any holder of a leasehold interest in a CAIR NO_X unit at the source or the CAIR NO_X unit; or

(iii) Any purchaser of power from a CAIR NO_X unit at the source or the CAIR NO_X unit under a life-of-the-unit, firm power contractual arrangement; provided that, unless expressly provided for in a leasehold agreement, owner shall not include a passive lessor, or a person who has an equitable interest through such lessor, whose rental payments are not based (either directly or indirectly) on the revenues or income from such CAIR NO_X unit; or

(2) With regard to any general account, any person who has an ownership interest with respect to the CAIR NO_X allowances held in the general account and who is subject to the binding agreement for the CAIR authorized account representative to represent the person's ownership interest with respect to CAIR NO_X allowances.

Permitting authority means the State air pollution control agency, local agency, other State agency, or other agency authorized by the Administrator to issue or revise permits to meet the requirements of the CAIR NO_X Annual Trading Program in accordance with subpart CC of this part or, if no such agency has been so authorized, the Administrator.

Potential electrical output capacity means 33 percent of a unit's maximum design heat input, divided by 3,413 Btu/kWh, divided by 1,000 kWh/MWh, and multiplied by 8,760 hr/yr.

Receive or receipt of means, when referring to the permitting authority or the Administrator, to come into possession of a document, information, or correspondence (whether sent in hard copy or by authorized electronic transmission), as indicated in an official correspondence log, or by a notation made on the document, information, or correspondence, by the permitting authority or the Administrator in the regular course of business.

Recordation, *record*, or *recorded* means, with regard to CAIR NO_X allowances, the movement of CAIR NO_X allowances by the Administrator into or between CAIR NO_X Allowance Tracking System accounts, for purposes of allocation, transfer, or deduction.

Reference method means any direct test method of sampling and analyzing for an air pollutant as specified in § 75.22 of this chapter.

Repowered means, with regard to a unit, replacement of a coal-fired boiler with one of the following coal-fired technologies at the same source as the coal-fired boiler:

(1) Atmospheric or pressurized fluidized bed combustion;

(2) Integrated gasification combined cycle;

(3) Magnetohydrodynamics;

(4) Direct and indirect coal-fired turbines;

(5) Integrated gasification fuel cells; or

(6) As determined by the Administrator in consultation with the Secretary of Energy, a derivative of one or more of the technologies under paragraphs (1) through (5) of this definition and any other coal-fired technology capable of controlling multiple combustion emissions simultaneously with improved boiler or generation efficiency and with significantly greater waste reduction relative to the performance of technology in widespread commercial use as of January 1, 2005.

Serial number means, for a CAIR NO_X allowance, the unique identification number assigned to each CAIR NO_X allowance by the Administrator.

Sequential use of energy means:

(1) For a topping-cycle cogeneration unit, the use of reject heat from

NMED Exhibit 7f

electricity production in a useful thermal energy application or process; or

(2) For a bottoming-cycle cogeneration unit, the use of reject heat from useful thermal energy application or process in electricity production.

Source means all buildings, structures, or installations located in one or more contiguous or adjacent properties under common control of the same person or persons. For purposes of section 502(c) of the Clean Air Act, a "source," including a "source" with multiple units, shall be considered a single "facility."

State means one of the States or the District of Columbia that adopts the CAIR NO_X Annual Trading Program pursuant to § 51.123(o)(1) or (2) of this chapter.

Submit or serve means to send or transmit a document, information, or correspondence to the person specified in accordance with the applicable regulation:

(1) In person;

(2) By United States Postal Service; or

(3) By other means of dispatch or transmission and delivery. Compliance with any "submission" or "service" deadline shall be determined by the date of dispatch, transmission, or mailing and not the date of receipt.

Title V operating permit means a permit issued under title V of the Clean Air Act and part 70 or part 71 of this chapter.

Title V operating permit regulations means the regulations that the Administrator has approved or issued as meeting the requirements of title V of the Clean Air Act and part 70 or 71 of this chapter.

Ton means 2,000 pounds. For the purpose of determining compliance with the CAIR NO_X emissions limitation, total tons of nitrogen oxides emissions for a control period shall be calculated as the sum of all recorded hourly emissions (or the mass equivalent of the recorded hourly emission rates) in accordance with subpart HH of this part, but with any remaining fraction of a ton equal to or greater than 0.50 tons deemed to equal one ton and any remaining fraction of a ton less than 0.50 tons deemed to equal zero tons.

Topping-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful power, including electricity, and at least some of the reject heat from the electricity production is then used to provide useful thermal energy.

Total energy input means, with regard to a cogeneration unit, total energy of all forms supplied to the cogeneration unit, excluding energy produced by the cogeneration unit itself.

Total energy output means, with regard to a cogeneration unit, the sum of useful power and useful thermal energy produced by the cogeneration unit.

Unit means a stationary, fossil-fuel-fired boiler or combustion turbine or other stationary, fossil-fuel-fired combustion device.

Unit operating day means a calendar day in which a unit combusts any fuel.

Unit operating hour or *hour of unit operation* means an hour in which a unit combusts any fuel.

Useful power means, with regard to a cogeneration unit, electricity or mechanical energy made available for use, excluding any such energy used in the power production process (which process includes, but is not limited to, any on-site processing or treatment of fuel combusted at the unit and any on-site emission controls).

Useful thermal energy means, with regard to a cogeneration unit, thermal energy that is:

(1) Made available to an industrial or commercial process (not a power production process), excluding any heat contained in condensate return or makeup water;

(2) Used in a heating application (*e.g.*, space heating or domestic hot water heating); or

(3) Used in a space cooling application (*i.e.*, thermal energy used by an absorption chiller).

Utility power distribution system means the portion of an electricity grid owned or operated by a utility and dedicated to delivering electricity to customers.

§ 96.103 Measurements, abbreviations, and acronyms.

Measurements, abbreviations, and acronyms used in this part are defined as follows:

Btu—British thermal unit.
CO_2—carbon dioxide.
NO_X—nitrogen oxides.
hr—hour.
kW—kilowatt electrical. kWh—kilowatt hour. mmBtu—million Btu.
MWe—megawatt electrical. MWh—megawatt hour.
O_2—oxygen. ppm—parts per million. lb—pound.
scfh—standard cubic feet per hour.
SO_2—sulfur dioxide.
H_2O—water.
yr—year.

§ 96.104 Applicability.

The following units in a State shall be CAIR NO_X units, and any source that includes one or more such units shall be a CAIR NO_X source, subject to the requirements of this subpart and subparts BB through HH of this part:

(a) Except as provided in paragraph (b) of this section, a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine serving at any time, since the start-up of the unit's combustion chamber, a generator with nameplate capacity of more than 25 MWe producing electricity for sale.

(b) For a unit that qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity and continues to qualify as a cogeneration unit, a cogeneration unit serving at any time a generator with nameplate capacity of more than 25 MWe and supplying in any calendar year more than one-third of the unit's potential electric output capacity or 219,000 MWh, whichever is greater, to any utility power distribution system for sale. If a unit qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity but subsequently no longer qualifies as a cogeneration unit, the unit shall be subject to paragraph (a) of this section starting on the day on which the unit first no longer qualifies as a cogeneration unit.

§ 96.105 Retired unit exemption.

(a)(1) Any CAIR NO_X unit that is permanently retired and is not a CAIR NO_X opt-in unit under subpart II of this part shall be exempt from the CAIR NO_X Annual Trading Program, except for the provisions of this section, § 96.102, § 96.103, § 96.104, § 96.106(c)(4) through (8), § 96.107, and subparts EE through GG of this part.

(2) The exemption under paragraph (a)(1) of this section shall become effective the day on which the CAIR NO_X unit is permanently retired. Within 30 days of the unit's permanent retirement, the CAIR designated representative shall submit a statement to the permitting authority otherwise responsible for administering any CAIR permit for the unit and shall submit a copy of the statement to the Administrator. The statement shall state, in a format prescribed by the permitting authority, that the unit was permanently retired on a specific date and will comply with the requirements of paragraph (b) of this section.

(3) After receipt of the statement under paragraph (a)(2) of this section, the permitting authority will amend any permit under subpart CC of this part covering the source at which the unit is located to add the provisions and requirements of the exemption under paragraphs (a)(1) and (b) of this section.

NMED Exhibit 7f

(b) *Special provisions.* (1) A unit exempt under paragraph (a) of this section shall not emit any nitrogen oxides, starting on the date that the exemption takes effect.

(2) The permitting authority will allocate CAIR NO_X allowances under subpart EE of this part to a unit exempt under paragraph (a) of this section.

(3) For a period of 5 years from the date the records are created, the owners and operators of a unit exempt under paragraph (a) of this section shall retain at the source that includes the unit, records demonstrating that the unit is permanently retired. The 5-year period for keeping records may be extended for cause, at any time before the end of the period, in writing by the permitting authority or the Administrator. The owners and operators bear the burden of proof that the unit is permanently retired.

(4) The owners and operators and, to the extent applicable, the CAIR designated representative of a unit exempt under paragraph (a) of this section shall comply with the requirements of the CAIR NO_X Annual Trading Program concerning all periods for which the exemption is not in effect, even if such requirements arise, or must be complied with, after the exemption takes effect.

(5) A unit exempt under paragraph (a) of this section and located at a source that is required, or but for this exemption would be required, to have a title V operating permit shall not resume operation unless the CAIR designated representative of the source submits a complete CAIR permit application under § 96.122 for the unit not less than 18 months (or such lesser time provided by the permitting authority) before the later of January 1, 2009 or the date on which the unit resumes operation.

(6) On the earlier of the following dates, a unit exempt under paragraph (a) of this section shall lose its exemption:

(i) The date on which the CAIR designated representative submits a CAIR permit application for the unit under paragraph (b)(5) of this section;

(ii) The date on which the CAIR designated representative is required under paragraph (b)(5) of this section to submit a CAIR permit application for the unit; or

(iii) The date on which the unit resumes operation, if the CAIR designated representative is not required to submit a CAIR permit application for the unit.

(7) For the purpose of applying monitoring, reporting, and recordkeeping requirements under subpart HH of this part, a unit that loses its exemption under paragraph (a) of this section shall be treated as a unit that commences operation and commercial operation on the first date on which the unit resumes operation.

§ 96.106 Standard requirements.

(a) *Permit requirements.* (1) The CAIR designated representative of each CAIR NO_X source required to have a title V operating permit and each CAIR NO_X unit required to have a title V operating permit at the source shall:

(i) Submit to the permitting authority a complete CAIR permit application under § 96.122 in accordance with the deadlines specified in § 96.121(a) and (b); and

(ii) Submit in a timely manner any supplemental information that the permitting authority determines is necessary in order to review a CAIR permit application and issue or deny a CAIR permit.

(2) The owners and operators of each CAIR NO_X source required to have a title V operating permit and each CAIR NO_X unit required to have a title V operating permit at the source shall have a CAIR permit issued by the permitting authority under subpart CC of this part for the source and operate the source and the unit in compliance with such CAIR permit.

(3) Except as provided in subpart II of this part, the owners and operators of a CAIR NO_X source that is not otherwise required to have a title V operating permit and each CAIR NO_X unit that is not otherwise required to have a title V operating permit are not required to submit a CAIR permit application, and to have a CAIR permit, under subpart CC of this part for such CAIR NO_X source and such CAIR NO_X unit.

(b) *Monitoring, reporting, and recordkeeping requirements.* (1) The owners and operators, and the CAIR designated representative, of each CAIR NO_X source and each CAIR NO_X unit at the source shall comply with the monitoring, reporting, and recordkeeping requirements of subpart HH of this part.

(2) The emissions measurements recorded and reported in accordance with subpart HH of this part shall be used to determine compliance by each CAIR NO_X source with the CAIR NO_X emissions limitation under paragraph (c) of this section.

(c) *Nitrogen oxides emission requirements.* (1) As of the allowance transfer deadline for a control period, the owners and operators of each CAIR NO_X source and each CAIR NO_X unit at the source shall hold, in the source's compliance account, CAIR NO_X allowances available for compliance deductions for the control period under § 96.154(a) in an amount not less than the tons of total nitrogen oxides emissions for the control period from all CAIR NO_X units at the source, as determined in accordance with subpart HH of this part.

(2) A CAIR NO_X unit shall be subject to the requirements under paragraph (c)(1) of this section starting on the later of January 1, 2009 or the deadline for meeting the unit's monitor certification requirements under § 96.170(b)(1),(2), or (5).

(3) A CAIR NO_X allowance shall not be deducted, for compliance with the requirements under paragraph (c)(1) of this section, for a control period in a calendar year before the year for which the CAIR NO_X allowance was allocated.

(4) CAIR NO_X allowances shall be held in, deducted from, or transferred into or among CAIR NO_X Allowance Tracking System accounts in accordance with subpart EE of this part.

(5) A CAIR NO_X allowance is a limited authorization to emit one ton of nitrogen oxides in accordance with the CAIR NO_X Annual Trading Program. No provision of the CAIR NO_X Annual Trading Program, the CAIR permit application, the CAIR permit, or an exemption under § 96.105 and no provision of law shall be construed to limit the authority of the State or the United States to terminate or limit such authorization.

(6) A CAIR NO_X allowance does not constitute a property right.

(7) Upon recordation by the Administrator under subpart FF, GG, or II of this part, every allocation, transfer, or deduction of a CAIR NO_X allowance to or from a CAIR NO_X unit's compliance account is incorporated automatically in any CAIR permit of the source that includes the CAIR NO_X unit.

(d) *Excess emissions requirements.* (1) If a CAIR NO_X source emits nitrogen oxides during any control period in excess of the CAIR NO_X emissions limitation, then:

(i) The owners and operators of the source and each CAIR NO_X unit at the source shall surrender the CAIR NO_X allowances required for deduction under § 96.154(d)(1) and pay any fine, penalty, or assessment or comply with any other remedy imposed, for the same violations, under the Clean Air Act or applicable State law; and

(ii) Each ton of such excess emissions and each day of such control period shall constitute a separate violation of this subpart, the Clean Air Act, and applicable State law.

(2) [Reserved.]

(e) *Recordkeeping and reporting requirements.* (1) Unless otherwise provided, the owners and operators of

NMED Exhibit 7f

the CAIR NO_X source and each CAIR NO_X unit at the source shall keep on site at the source each of the following documents for a period of 5 years from the date the document is created. This period may be extended for cause, at any time before the end of 5 years, in writing by the permitting authority or the Administrator.

(i) The certificate of representation under § 96.113 for the CAIR designated representative for the source and each CAIR NO_X unit at the source and all documents that demonstrate the truth of the statements in the certificate of representation; provided that the certificate and documents shall be retained on site at the source beyond such 5-year period until such documents are superseded because of the submission of a new certificate of representation under § 96.113 changing the CAIR designated representative.

(ii) All emissions monitoring information, in accordance with subpart HH of this part, provided that to the extent that subpart HH of this part provides for a 3-year period for recordkeeping, the 3-year period shall apply.

(iii) Copies of all reports, compliance certifications, and other submissions and all records made or required under the CAIR NO_X Annual Trading Program.

(iv) Copies of all documents used to complete a CAIR permit application and any other submission under the CAIR NO_X Annual Trading Program or to demonstrate compliance with the requirements of the CAIR NO_X Annual Trading Program.

(2) The CAIR designated representative of a CAIR NO_X source and each CAIR NO_X unit at the source shall submit the reports required under the CAIR NO_X Annual Trading Program, including those under subpart HH of this part.

(f) *Liability.* (1) Each CAIR NO_X source and each CAIR NO_X unit shall meet the requirements of the CAIR NO_X Annual Trading Program.

(2) Any provision of the CAIR NO_X Annual Trading Program that applies to a CAIR NO_X source or the CAIR designated representative of a CAIR NO_X source shall also apply to the owners and operators of such source and of the CAIR NO_X units at the source.

(3) Any provision of the CAIR NO_X Annual Trading Program that applies to a CAIR NO_X unit or the CAIR designated representative of a CAIR NO_X unit shall also apply to the owners and operators of such unit.

(g) *Effect on other authorities.* No provision of the CAIR NO_X Annual Trading Program, a CAIR permit application, a CAIR permit, or an exemption under § 96.105 shall be construed as exempting or excluding the owners and operators, and the CAIR designated representative, of a CAIR NO_X source or CAIR NO_X unit from compliance with any other provision of the applicable, approved State implementation plan, a federally enforceable permit, or the Clean Air Act.

§ 96.107 Computation of time.

(a) Unless otherwise stated, any time period scheduled, under the CAIR NO_X Annual Trading Program, to begin on the occurrence of an act or event shall begin on the day the act or event occurs.

(b) Unless otherwise stated, any time period scheduled, under the CAIR NO_X Annual Trading Program, to begin before the occurrence of an act or event shall be computed so that the period ends the day before the act or event occurs.

(c) Unless otherwise stated, if the final day of any time period, under the CAIR NO_X Annual Trading Program, falls on a weekend or a State or Federal holiday, the time period shall be extended to the next business day.

§ 96.108 Appeal procedures.

The appeal procedures for decisions of the Administrator under the CAIR NO_X Annual Trading Program are set forth in part 78 of this chapter.

Subpart BB—CAIR Designated Representative for CAIR NO_X Sources

§ 96.110 Authorization and responsibilities of CAIR designated representative.

(a) Except as provided under § 96.111, each CAIR NO_X source, including all CAIR NO_X units at the source, shall have one and only one CAIR designated representative, with regard to all matters under the CAIR NO_X Annual Trading Program concerning the source or any CAIR NO_X unit at the source.

(b) The CAIR designated representative of the CAIR NO_X source shall be selected by an agreement binding on the owners and operators of the source and all CAIR NO_X units at the source and shall act in accordance with the certification statement in § 96.113(a)(4)(iv).

(c) Upon receipt by the Administrator of a complete certificate of representation under § 96.113, the CAIR designated representative of the source shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each owner and operator of the CAIR NO_X source represented and each CAIR NO_X unit at the source in all matters pertaining to the CAIR NO_X Annual Trading Program, notwithstanding any agreement between the CAIR designated representative and such owners and operators. The owners and operators shall be bound by any decision or order issued to the CAIR designated representative by the permitting authority, the Administrator, or a court regarding the source or unit.

(d) No CAIR permit will be issued, no emissions data reports will be accepted, and no CAIR NO_X Allowance Tracking System account will be established for a CAIR NO_X unit at a source, until the Administrator has received a complete certificate of representation under § 96.113 for a CAIR designated representative of the source and the CAIR NO_X units at the source.

(e)(1) Each submission under the CAIR NO_X Annual Trading Program shall be submitted, signed, and certified by the CAIR designated representative for each CAIR NO_X source on behalf of which the submission is made. Each such submission shall include the following certification statement by the CAIR designated representative: ''I am authorized to make this submission on behalf of the owners and operators of the source or units for which the submission is made. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment.''

(2) The permitting authority and the Administrator will accept or act on a submission made on behalf of owner or operators of a CAIR NO_X source or a CAIR NO_X unit only if the submission has been made, signed, and certified in accordance with paragraph (e)(1) of this section.

§ 96.111 Alternate CAIR designated representative.

(a) A certificate of representation under § 96.113 may designate one and only one alternate CAIR designated representative, who may act on behalf of the CAIR designated representative. The agreement by which the alternate CAIR designated representative is selected shall include a procedure for authorizing the alternate CAIR designated representative to act in lieu of the CAIR designated representative.

NMED Exhibit 7f

(b) Upon receipt by the Administrator of a complete certificate of representation under § 96.113, any representation, action, inaction, or submission by the alternate CAIR designated representative shall be deemed to be a representation, action, inaction, or submission by the CAIR designated representative.

(c) Except in this section and §§ 96.102, 96.110(a) and (d), 96.112, 96.113, 96.151 and 96.182, whenever the term ''CAIR designated representative'' is used in subparts AA through II of this part, the term shall be construed to include the CAIR designated representative or any alternate CAIR designated representative.

§ 96.112 Changing CAIR designated representative and alternate CAIR designated representative; changes in owners and operators.

(a) *Changing CAIR designated representative.* The CAIR designated representative may be changed at any time upon receipt by the Administrator of a superseding complete certificate of representation under § 96.113. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CAIR designated representative before the time and date when the Administrator receives the superseding certificate of representation shall be binding on the new CAIR designated representative and the owners and operators of the CAIR NO_X source and the CAIR NO_X units at the source.

(b) *Changing alternate CAIR designated representative.* The alternate CAIR designated representative may be changed at any time upon receipt by the Administrator of a superseding complete certificate of representation under § 96.113. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous alternate CAIR designated representative before the time and date when the Administrator receives the superseding certificate of representation shall be binding on the new alternate CAIR designated representative and the owners and operators of the CAIR NO_X source and the CAIR NO_X units at the source.

(c) Changes in owners and operators. (1) In the event a new owner or operator of a CAIR NO_X source or a CAIR NO_X unit is not included in the list of owners and operators in the certificate of representation under § 96.113, such new owner or operator shall be deemed to be subject to and bound by the certificate of representation, the representations, actions, inactions, and submissions of the CAIR designated representative and any alternate CAIR designated representative of the source or unit, and the decisions and orders of the permitting authority, the Administrator, or a court, as if the new owner or operator were included in such list.

(2) Within 30 days following any change in the owners and operators of a CAIR NO_X source or a CAIR NO_X unit, including the addition of a new owner or operator, the CAIR designated representative or any alternate CAIR designated representative shall submit a revision to the certificate of representation under § 96.113 amending the list of owners and operators to include the change.

§ 96.113 Certificate of representation.

(a) A complete certificate of representation for a CAIR designated representative or an alternate CAIR designated representative shall include the following elements in a format prescribed by the Administrator:

(1) Identification of the CAIR NO_X source, and each CAIR NO_X unit at the source, for which the certificate of representation is submitted.

(2) The name, address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the CAIR designated representative and any alternate CAIR designated representative.

(3) A list of the owners and operators of the CAIR NO_X source and of each CAIR NO_X unit at the source.

(4) The following certification statements by the CAIR designated representative and any alternate CAIR designated representative—

(i) ''I certify that I was selected as the CAIR designated representative or alternate CAIR designated representative, as applicable, by an agreement binding on the owners and operators of the source and each CAIR NO_X unit at the source.''

(ii) ''I certify that I have all the necessary authority to carry out my duties and responsibilities under the CAIR NO_X Annual Trading Program on behalf of the owners and operators of the source and of each CAIR NO_X unit at the source and that each such owner and operator shall be fully bound by my representations, actions, inactions, or submissions.''

(iii) ''I certify that the owners and operators of the source and of each CAIR NO_X unit at the source shall be bound by any order issued to me by the Administrator, the permitting authority, or a court regarding the source or unit.''

(iv) ''Where there are multiple holders of a legal or equitable title to, or a leasehold interest in, a CAIR NO_X unit, or where a customer purchases power from a CAIR NO_X unit under a life-of- the-unit, firm power contractual arrangement, I certify that: I have given a written notice of my selection as the 'CAIR designated representative' or 'alternate CAIR designated representative', as applicable, and of the agreement by which I was selected to each owner and operator of the source and of each CAIR NO_X unit at the source; and CAIR NO_X allowances and proceeds of transactions involving CAIR NO_X allowances will be deemed to be held or distributed in proportion to each holder's legal, equitable, leasehold, or contractual reservation or entitlement, except that, if such multiple holders have expressly provided for a different distribution of CAIR NO_X allowances by contract, CAIR NO_X allowances and proceeds of transactions involving CAIR NO_X allowances will be deemed to be held or distributed in accordance with the contract.''

(5) The signature of the CAIR designated representative and any alternate CAIR designated representative and the dates signed.

(b) Unless otherwise required by the permitting authority or the Administrator, documents of agreement referred to in the certificate of representation shall not be submitted to the permitting authority or the Administrator. Neither the permitting authority nor the Administrator shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

§ 96.114 Objections concerning CAIR designated representative.

(a) Once a complete certificate of representation under § 96.113 has been submitted and received, the permitting authority and the Administrator will rely on the certificate of representation unless and until a superseding complete certificate of representation under § 96.113 is received by the Administrator.

(b) Except as provided in § 96.112(a) or (b), no objection or other communication submitted to the permitting authority or the Administrator concerning the authorization, or any representation, action, inaction, or submission, of the CAIR designated representative shall affect any representation, action, inaction, or submission of the CAIR designated representative or the finality of any decision or order by the permitting authority or the Administrator under the CAIR NO_X Annual Trading Program.

(c) Neither the permitting authority nor the Administrator will adjudicate

NMED Exhibit 7f

any private legal dispute concerning the authorization or any representation, action, inaction, or submission of any CAIR designated representative, including private legal disputes concerning the proceeds of CAIR NO_X allowance transfers.

Subpart CC—Permits

§ 96.120 General CAIR Annual Trading Program permit requirements.

(a) For each CAIR NO_X source required to have a title V operating permit or required, under subpart II of this part, to have a title V operating permit or other federally enforceable permit, such permit shall include a CAIR permit administered by the permitting authority for the title V operating permit or the federally enforceable permit as applicable. The CAIR portion of the title V permit or other federally enforceable permit as applicable shall be administered in accordance with the permitting authority's title V operating permits regulations promulgated under part 70 or 71 of this chapter or the permitting authority's regulations for other federally enforceable permits as applicable, except as provided otherwise by this subpart and subpart II of this part.

(b) Each CAIR permit shall contain, with regard to the CAIR NO_X source and the CAIR NO_X units at the source covered by the CAIR permit, all applicable CAIR NO_X Annual Trading Program, CAIR NO_X Ozone Season Trading Program, and CAIR SO_2 Trading Program requirements and shall be a complete and separable portion of the title V operating permit or other federally enforceable permit under paragraph (a) of this section.

§ 96.121 Submission of CAIR permit applications.

(a) *Duty to apply.* The CAIR designated representative of any CAIR NO_X source required to have a title V operating permit shall submit to the permitting authority a complete CAIR permit application under § 96.122 for the source covering each CAIR NO_X unit at the source at least 18 months (or such lesser time provided by the permitting authority) before the later of January 1, 2009 or the date on which the CAIR NO_X unit commences operation.

(b) *Duty to Reapply.* For a CAIR NO_X source required to have a title V operating permit, the CAIR designated representative shall submit a complete CAIR permit application under § 96.122 for the source covering each CAIR NO_X unit at the source to renew the CAIR permit in accordance with the permitting authority's title V operating permits regulations addressing permit renewal.

§ 96.122 Information requirements for CAIR permit applications.

A complete CAIR permit application shall include the following elements concerning the CAIR NO_X source for which the application is submitted, in a format prescribed by the permitting authority:

(a) Identification of the CAIR NO_X source;

(b) Identification of each CAIR NO_X unit at the CAIR NO_X source; and

(c) The standard requirements under § 96.106.

§ 96.123 CAIR permit contents and term.

(a) Each CAIR permit will contain, in a format prescribed by the permitting authority, all elements required for a complete CAIR permit application under § 96.122.

(b) Each CAIR permit is deemed to incorporate automatically the definitions of terms under § 96.102 and, upon recordation by the Administrator under subpart FF, GG, or II of this part, every allocation, transfer, or deduction of a CAIR NO_X allowance to or from the compliance account of the CAIR NO_X source covered by the permit.

(c) The term of the CAIR permit will be set by the permitting authority, as necessary to facilitate coordination of the renewal of the CAIR permit with issuance, revision, or renewal of the CAIR NO_X source's title V operating permit or other federally enforceable permit as applicable.

§ 96.124 CAIR permit revisions.

Except as provided in § 96.123(b), the permitting authority will revise the CAIR permit, as necessary, in accordance with the permitting authority's title V operating permits regulations or the permitting authority's regulations for other federally enforceable permits as applicable addressing permit revisions.

Subpart DD—[Reserved]

Subpart EE—CAIR NO_X Allowance Allocations

§ 96.140 State trading budgets.

The State trading budgets for annual allocations of CAIR NO_X allowances for the control periods in 2009 through 2014 and in 2015 and thereafter are respectively as follows:

State	State trading budget for 2009–2014 (tons)	State trading budget for 2015 and thereafter (tons)
Alabama	69,020	57,517
District of Columbia	144	120
Florida	99,445	82,871
Georgia	66,321	55,268
Illinois	76,230	63,525
Indiana	108,935	90,779
Iowa	32,692	27,243
Kentucky	83,205	69,337
Louisiana	35,512	29,593
Maryland	27,724	23,104
Michigan	65,304	54,420
Minnesota	31,443	26,203
Mississippi	17,807	14,839
Missouri	59,871	49,892
New York	45,617	38,014
North Carolina	62,183	51,819
Ohio	108,667	90,556
Pennsylvania	99,049	82,541
South Carolina	32,662	27,219
Tennessee	50,973	42,478
Texas	181,014	150,845

NMED Exhibit 7f

State	State trading budget for 2009–2014 (tons)	State trading budget for 2015 and thereafter (tons)
Virginia	36,074	30,062
West Virginia	74,220	61,850
Wisconsin	40,759	33,966

§ 96.141 Timing requirements for CAIR NO_X allowance allocations.

(a) By October 31, 2006, the permitting authority will submit to the Administrator the CAIR NO_X allowance allocations, in a format prescribed by the Administrator and in accordance with § 96.142(a) and (b), for the control periods in 2009, 2010, 2011, 2012, 2013, and 2014.

(b)(1) By October 31, 2009 and October 31 of each year thereafter, the permitting authority will submit to the Administrator the CAIR NO_X allowance allocations, in a format prescribed by the Administrator and in accordance with § 96.142(a) and (b), for the control period in the sixth year after the year of the applicable deadline for submission under this paragraph.

(2) If the permitting authority fails to submit to the Administrator the CAIR NO_X allowance allocations in accordance with paragraph (b)(1) of this section, the Administrator will assume that the allocations of CAIR NO_X allowances for the applicable control period are the same as for the control period that immediately precedes the applicable control period, except that, if the applicable control period is in 2015, the Administrator will assume that the allocations equal 83 percent of the allocations for the control period that immediately precedes the applicable control period.

(c)(1) By October 31, 2009 and October 31 of each year thereafter, the permitting authority will submit to the Administrator the CAIR NO_X allowance allocations, in a format prescribed by the Administrator and in accordance with § 96.142(a), (c), and (d), for the control period in the year of the applicable deadline for submission under this paragraph.

(2) If the permitting authority fails to submit to the Administrator the CAIR NO_X allowance allocations in accordance with paragraph (c)(1) of this section, the Administrator will assume that the allocations of CAIR NO_X allowances for the applicable control period are the same as for the control period that immediately precedes the applicable control period, except that, if the applicable control period is in 2015, the Administrator will assume that the allocations equal 83 percent of the allocations for the control period that immediately precedes the applicable control period and except that any CAIR NO_X unit that would otherwise be allocated CAIR NO_X allowances under § 96.142(a) and (b), as well as under § 96.142(a), (c), and (d), for the applicable control period will be assumed to be allocated no CAIR NO_X allowances under § 96.142(a), (c), and (d) for the applicable control period.

§ 96.142 CAIR NO_X allowance allocations.

(a)(1) The baseline heat input (in mmBtu) used with respect to CAIR NO_X allowance allocations under paragraph (b) of this section for each CAIR NO_X unit will be:

(i) For units commencing operation before January 1, 2001 the average of the 3 highest amounts of the unit's adjusted control period heat input for 2000 through 2004, with the adjusted control period heat input for each year calculated as follows:

(A) If the unit is coal-fired during the year, the unit's control period heat input for such year is multiplied by 100 percent;

(B) If the unit is oil-fired during the year, the unit's control period heat input for such year is multiplied by 60 percent; and

(C) If the unit is not subject to paragraph (a)(1)(i)(A) or (B) of this section, the unit's control period heat input for such year is multiplied by 40 percent.

(ii) For units commencing operation on or after January 1, 2001 and operating each calendar year during a period of 5 or more consecutive calendar years, the average of the 3 highest amounts of the unit's total converted control period heat input over the first such 5 years.

(2)(i) A unit's control period heat input, and a unit's status as coal-fired or oil-fired, for a calendar year under paragraph (a)(1)(i) of this section, and a unit's total tons of NO_X emissions during a calendar year under paragraph (c)(3) of this section, will be determined in accordance with part 75 of this chapter, to the extent the unit was otherwise subject to the requirements of part 75 of this chapter for the year, or will be based on the best available data reported to the permitting authority for the unit, to the extent the unit was not otherwise subject to the requirements of part 75 of this chapter for the year.

(ii) A unit's converted control period heat input for a calendar year specified under paragraph (a)(1)(ii) of this section equals:

(A) Except as provided in paragraph (a)(2)(ii)(B) or (C) of this section, the control period gross electrical output of the generator or generators served by the unit multiplied by 7,900 Btu/kWh, if the unit is coal-fired for the year, or 6,675 Btu/kWh, if the unit is not coal-fired for the year, and divided by 1,000,000 Btu/mmBtu, provided that if a generator is served by 2 or more units, then the gross electrical output of the generator will be attributed to each unit in proportion to the unit's share of the total control period heat input of such units for the year;

(B) For a unit that is a boiler and has equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through the sequential use of energy, the total heat energy (in Btu) of the steam produced by the boiler during the control period, divided by 0.8 and by 1,000,000 Btu/mmBtu; or

(C) For a unit that is a combustion turbine and has equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through the sequential use of energy, the control period gross electrical output of the enclosed device comprising the compressor, combustor, and turbine multiplied by 3,414 Btu/kWh, plus the total heat energy (in Btu) of the steam produced by any associated heat recovery steam generator during the control period divided by 0.8, and with the sum divided by 1,000,000 Btu/mmBtu.

(b)(1) For each control period in 2009 and thereafter, the permitting authority will allocate to all CAIR NO_X units in the State that have a baseline heat input (as determined under paragraph (a) of this section) a total amount of CAIR NO_X allowances equal to 95 percent for a control period during 2009 through 2014, and 97 percent for a control period during 2015 and thereafter, of the tons of NO_X emissions in the State trading budget under § 96.140 (except as provided in paragraph (d) of this section).

NMED Exhibit 7f

(2) The permitting authority will allocate CAIR NO_X allowances to each CAIR NO_X unit under paragraph (b)(1) of this section in an amount determined by multiplying the total amount of CAIR NO_X allowances allocated under paragraph (b)(1) of this section by the ratio of the baseline heat input of such CAIR NO_X unit to the total amount of baseline heat input of all such CAIR NO_X units in the State and rounding to the nearest whole allowance as appropriate.

(c) For each control period in 2009 and thereafter, the permitting authority will allocate CAIR NO_X allowances to CAIR NO_X units in the State that commenced operation on or after January 1, 2001 and do not yet have a baseline heat input (as determined under paragraph (a) of this section), in accordance with the following procedures:

(1) The permitting authority will establish a separate new unit set-aside for each control period. Each new unit set-aside will be allocated CAIR NO_X allowances equal to 5 percent for a control period in 2009 through 2013, and 3 percent for a control period in 2014 and thereafter, of the amount of tons of NO_X emissions in the State trading budget under § 96.140.

(2) The CAIR designated representative of such a CAIR NO_X unit may submit to the permitting authority a request, in a format specified by the permitting authority, to be allocated CAIR NO_X allowances, starting with the later of the control period in 2009 or the first control period after the control period in which the CAIR NO_X unit commences commercial operation and until the first control period for which the unit is allocated CAIR NO_X allowances under paragraph (b) of this section. The CAIR NO_X allowance allocation request must be submitted on or before July 1 of the first control period for which the CAIR NO_X allowances are requested and after the date on which the CAIR NO_X unit commences commercial operation.

(3) In a CAIR NO_X allowance allocation request under paragraph (c)(2) of this section, the CAIR designated representative may request for a control period CAIR NO_X allowances in an amount not exceeding the CAIR NO_X unit's total tons of NO_X emissions during the calendar year immediately before such control period.

(4) The permitting authority will review each CAIR NO_X allowance allocation request under paragraph (c)(2) of this section and will allocate CAIR NO_X allowances for each control period pursuant to such request as follows:

(i) The permitting authority will accept an allowance allocation request only if the request meets, or is adjusted by the permitting authority as necessary to meet, the requirements of paragraphs (c)(2) and (3) of this section.

(ii) On or after July 1 of the control period, the permitting authority will determine the sum of the CAIR NO_X allowances requested (as adjusted under paragraph (c)(4)(i) of this section) in all allowance allocation requests accepted under paragraph (c)(4)(i) of this section for the control period.

(iii) If the amount of CAIR NO_X allowances in the new unit set-aside for the control period is greater than or equal to the sum under paragraph (c)(4)(ii) of this section, then the permitting authority will allocate the amount of CAIR NO_X allowances requested (as adjusted under paragraph (c)(4)(i) of this section) to each CAIR NO_X unit covered by an allowance allocation request accepted under paragraph (c)(4)(i) of this section.

(iv) If the amount of CAIR NO_X allowances in the new unit set-aside for the control period is less than the sum under paragraph (c)(4)(ii) of this section, then the permitting authority will allocate to each CAIR NO_X unit covered by an allowance allocation request accepted under paragraph (c)(4)(i) of this section the amount of the CAIR NO_X allowances requested (as adjusted under paragraph (c)(4)(i) of this section), multiplied by the amount of CAIR NO_X allowances in the new unit set-aside for the control period, divided by the sum determined under paragraph (c)(4)(ii) of this section, and rounded to the nearest whole allowance as appropriate.

(v) The permitting authority will notify each CAIR designated representative that submitted an allowance allocation request of the amount of CAIR NO_X allowances (if any) allocated for the control period to the CAIR NO_X unit covered by the request.

(d) If, after completion of the procedures under paragraph (c)(4) of this section for a control period, any unallocated CAIR NO_X allowances remain in the new unit set-aside for the control period, the permitting authority will allocate to each CAIR NO_X unit that was allocated CAIR NO_X allowances under paragraph (b) of this section an amount of CAIR NO_X allowances equal to the total amount of such remaining unallocated CAIR NO_X allowances, multiplied by the unit's allocation under paragraph (b) of this section, divided by 95 percent for a control period during 2009 through 2014, and 97 percent for a control period during 2015 and thereafter, of the amount of tons of NO_X emissions in the State trading budget under § 96.140, and rounded to the nearest whole allowance as appropriate.

§ 96.143 Compliance supplement pool.

(a) In addition to the CAIR NO_X allowances allocated under § 96.142, the permitting authority may allocate for the control period in 2009 up to the following amount of CAIR NO_X allowances to CAIR NO_X units in the respective State:

State	Compliance supplement pool
Alabama	10,166
District Of Columbia	0
Florida	8,335
Georgia	12,397
Illinois	11,299
Indiana	20,155
Iowa	6,978
Kentucky	14,935
Louisiana	2,251
Maryland	4,670
Michigan	8,347
Minnesota	6,528
Mississippi	3,066
Missouri	9,044
New York	0
North Carolina	0
Ohio	25,037
Pennsylvania	16,009
South Carolina	2,600
Tennessee	8,944
Texas	772
Virginia	5,134
West Virginia	16,929
Wisconsin	4,898

(b) For any CAIR NO_X unit in the State that achieves NO_X emission reductions in 2007 and 2008 that are not necessary to comply with any State or federal emissions limitation applicable during such years, the CAIR designated representative of the unit may request early reduction credits, and allocation of CAIR NO_X allowances from the compliance supplement pool under paragraph (a) of this section for such early reduction credits, in accordance with the following:

(1) The owners and operators of such CAIR NO_X unit shall monitor and report the NO_X emissions rate and the heat input of the unit in accordance with subpart HH of this part in each control period for which early reduction credit is requested.

(2) The CAIR designated representative of such CAIR NO_X unit shall submit to the permitting authority by July 1, 2009 a request, in a format specified by the permitting authority, for allocation of an amount of CAIR NO_X allowances from the compliance supplement pool not exceeding the sum of the amounts (in tons) of the unit's

NMED Exhibit 7f

NO_X emission reductions in 2007 and 2008 that are not necessary to comply with any State or federal emissions limitation applicable during such years, determined in accordance with subpart HH of this part.

(c) For any CAIR NO_X unit in the State whose compliance with CAIR NO_X emissions limitation for the control period in 2009 would create an undue risk to the reliability of electricity supply during such control period, the CAIR designated representative of the unit may request the allocation of CAIR NO_X allowances from the compliance supplement pool under paragraph (a) of this section, in accordance with the following:

(1) The CAIR designated representative of such CAIR NO_X unit shall submit to the permitting authority by July 1, 2009 a request, in a format specified by the permitting authority, for allocation of an amount of CAIR NO_X allowances from the compliance supplement pool not exceeding the minimum amount of CAIR NO_X allowances necessary to remove such undue risk to the reliability of electricity supply.

(2) In the request under paragraph (c)(1) of this section, the CAIR designated representative of such CAIR NO_X unit shall demonstrate that, in the absence of allocation to the unit of the amount of CAIR NO_X allowances requested, the unit's compliance with CAIR NO_X emissions limitation for the control period in 2009 would create an undue risk to the reliability of electricity supply during such control period. This demonstration must include a showing that it would not be feasible for the owners and operators of the unit to:

(i) Obtain a sufficient amount of electricity from other electricity generation facilities, during the installation of control technology at the unit for compliance with the CAIR NO_X emissions limitation, to prevent such undue risk; or

(ii) Obtain under paragraphs (b) and (d) of this section, or otherwise obtain, a sufficient amount of CAIR NO_X allowances to prevent such undue risk.

(d) The permitting authority will review each request under paragraph (b) or (c) of this section submitted by July 1, 2009 and will allocate CAIR NO_X allowances for the control period in 2009 to CAIR NO_X units in the State and covered by such request as follows:

(1) Upon receipt of each such request, the permitting authority will make any necessary adjustments to the request to ensure that the amount of the CAIR NO_X allowances requested meets the requirements of paragraph (b) or (c) of this section.

(2) If the State's compliance supplement pool under paragraph (a) of this section has an amount of CAIR NO_X allowances not less than the total amount of CAIR NO_X allowances in all such requests (as adjusted under paragraph (d)(1) of this section), the permitting authority will allocate to each CAIR NO_X unit covered by such requests the amount of CAIR NO_X allowances requested (as adjusted under paragraph (d)(1) of this section).

(3) If the State's compliance supplement pool under paragraph (a) of this section has a smaller amount of CAIR NO_X allowances than the total amount of CAIR NO_X allowances in all such requests (as adjusted under paragraph (d)(1) of this section), the permitting authority will allocate CAIR NO_X allowances to each CAIR NO_X unit covered by such requests according to the following formula and rounding to the nearest whole allowance as appropriate:

Unit's allocation = Unit's adjusted allocation × (State's compliance supplement pool ÷ Total adjusted allocations for all units)

Where:

''Unit's allocation'' is the number of CAIR NO_X allowances allocated to the unit from the State's compliance supplement pool. Unit's adjusted allocation'' is the amount of CAIR NO_X allowances requested for the unit under paragraph (b) or (c) of this section, as adjusted under paragraph (d)(1) of this section. ''State's compliance supplement pool'' is the amount of CAIR NO_X allowances in the State's compliance supplement pool. ''Total adjusted allocations for all units'' is the sum of the amounts of allocations requested for all units under paragraph (b) or (c) of this section, as adjusted under paragraph (d)(1) of this section.

(4) By November 30, 2009, the permitting authority will determine, and submit to the Administrator, the allocations under paragraph (d)(3) or (4) of this section.

(5) By January 1, 2010, the Administrator will record the allocations under paragraph (d)(5) of this section.

Subpart FF—CAIR NO_X Allowance Tracking System

§ 96.150 [Reserved]

§ 96.151 Establishment of accounts.

(a) *Compliance accounts.* Except as provided in § 96.184(e), upon receipt of a complete certificate of representation under § 96.113, the Administrator will establish a compliance account for the CAIR NO_X source for which the certificate of representation was submitted unless the source already has a compliance account.

(b) General accounts. (1) *Application for general account.*

(i) Any person may apply to open a general account for the purpose of holding and transferring CAIR NO_X allowances. An application for a general account may designate one and only one CAIR authorized account representative and one and only one alternate CAIR authorized account representative who may act on behalf of the CAIR authorized account representative. The agreement by which the alternate CAIR authorized account representative is selected shall include a procedure for authorizing the alternate CAIR authorized account representative to act in lieu of the CAIR authorized account representative.

(ii) A complete application for a general account shall be submitted to the Administrator and shall include the following elements in a format prescribed by the Administrator:

(A) Name, mailing address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the CAIR authorized account representative and any alternate CAIR authorized account representative;

(B) Organization name and type of organization, if applicable;

(C) A list of all persons subject to a binding agreement for the CAIR authorized account representative and any alternate CAIR authorized account representative to represent their ownership interest with respect to the CAIR NO_X allowances held in the general account;

(D) The following certification statement by the CAIR authorized account representative and any alternate CAIR authorized account representative: ''I certify that I was selected as the CAIR authorized account representative or the alternate CAIR authorized account representative, as applicable, by an agreement that is binding on all persons who have an ownership interest with respect to CAIR NO_X allowances held in the general account. I certify that I have all the necessary authority to carry out my duties and responsibilities under the CAIR NO_X Annual Trading Program on behalf of such persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the Administrator or a court regarding the general account.''

(E) The signature of the CAIR authorized account representative and any alternate CAIR authorized account representative and the dates signed.

(iii) Unless otherwise required by the permitting authority or the Administrator, documents of agreement referred to in the application for a general account shall not be submitted to the permitting authority or the Administrator. Neither the permitting authority nor the Administrator shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

(2) Authorization of CAIR authorized account representative.

(i) Upon receipt by the Administrator of a complete application for a general account under paragraph (b)(1) of this section:

(A) The Administrator will establish a general account for the person or persons for whom the application is submitted.

(B) The CAIR authorized account representative and any alternate CAIR authorized account representative for the general account shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each person who has an ownership interest with respect to CAIR NO_X allowances held in the general account in all matters pertaining to the CAIR NO_X Annual Trading Program, notwithstanding any agreement between the CAIR authorized account representative or any alternate CAIR authorized account representative and such person. Any such person shall be bound by any order or decision issued to the CAIR authorized account representative or any alternate CAIR authorized account representative by the Administrator or a court regarding the general account.

(C) Any representation, action, inaction, or submission by any alternate CAIR authorized account representative shall be deemed to be a representation, action, inaction, or submission by the CAIR authorized account representative.

(ii) Each submission concerning the general account shall be submitted, signed, and certified by the CAIR authorized account representative or any alternate CAIR authorized account representative for the persons having an ownership interest with respect to CAIR NO_X allowances held in the general account. Each such submission shall include the following certification statement by the CAIR authorized account representative or any alternate CAIR authorized account representative: ''I am authorized to make this submission on behalf of the persons having an ownership interest with respect to the CAIR NO_X allowances held in the general account. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment.''

(iii) The Administrator will accept or act on a submission concerning the general account only if the submission has been made, signed, and certified in accordance with paragraph (b)(2)(ii) of this section.

(3) Changing CAIR authorized account representative and alternate CAIR authorized account representative; changes in persons with ownership interest.

(i) The CAIR authorized account representative for a general account may be changed at any time upon receipt by the Administrator of a superseding complete application for a general account under paragraph (b)(1) of this section. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CAIR authorized account representative before the time and date when the Administrator receives the superseding application for a general account shall be binding on the new CAIR authorized account representative and the persons with an ownership interest with respect to the CAIR NO_X allowances in the general account.

(ii) The alternate CAIR authorized account representative for a general account may be changed at any time upon receipt by the Administrator of a superseding complete application for a general account under paragraph (b)(1) of this section. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous alternate CAIR authorized account representative before the time and date when the Administrator receives the superseding application for a general account shall be binding on the new alternate CAIR authorized account representative and the persons with an ownership interest with respect to the CAIR NO_X allowances in the general account.

(iii)(A) In the event a new person having an ownership interest with respect to CAIR NO_X allowances in the general account is not included in the list of such persons in the application for a general account, such new person shall be deemed to be subject to and bound by the application for a general account, the representation, actions, inactions, and submissions of the CAIR authorized account representative and any alternate CAIR authorized account representative of the account, and the decisions and orders of the Administrator or a court, as if the new person were included in such list.

(B) Within 30 days following any change in the persons having an ownership interest with respect to CAIR NO_X allowances in the general account, including the addition of persons, the CAIR authorized account representative or any alternate CAIR authorized account representative shall submit a revision to the application for a general account amending the list of persons having an ownership interest with respect to the CAIR NO_X allowances in the general account to include the change.

(4) Objections concerning CAIR authorized account representative.

(i) Once a complete application for a general account under paragraph (b)(1) of this section has been submitted and received, the Administrator will rely on the application unless and until a superseding complete application for a general account under paragraph (b)(1) of this section is received by the Administrator.

(ii) Except as provided in paragraph (b)(3)(i) or (ii) of this section, no objection or other communication submitted to the Administrator concerning the authorization, or any representation, action, inaction, or submission of the CAIR authorized account representative or any alternative CAIR authorized account representative for a general account shall affect any representation, action, inaction, or submission of the CAIR authorized account representative or any alternative CAIR authorized account representative or the finality of any decision or order by the Administrator under the CAIR NO_X Annual Trading Program.

(iii) The Administrator will not adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of the CAIR authorized account representative or any alternative CAIR authorized account representative for a general account, including private legal disputes concerning the proceeds of CAIR NO_X allowance transfers.

(c) *Account identification.* The Administrator will assign a unique identifying number to each account established under paragraph (a) or (b) of this section.

NMED Exhibit 7f

§ 96.152 Responsibilities of CAIR authorized account representative.

Following the establishment of a CAIR NO_X Allowance Tracking System account, all submissions to the Administrator pertaining to the account, including, but not limited to, submissions concerning the deduction or transfer of CAIR NO_X allowances in the account, shall be made only by the CAIR authorized account representative for the account.

§ 96.153 Recordation of CAIR NO_X allowance allocations.

(a) By December 1, 2006, the Administrator will record in the CAIR NO_X source's compliance account the CAIR NO_X allowances allocated for the CAIR NO_X units at a source, as submitted by the permitting authority in accordance with § 96.141(a), for the control periods in 2009, 2010, 2011, 2012, 2013, and 2014.

(b) By December 1, 2009, the Administrator will record in the CAIR NO_X source's compliance account the CAIR NO_X allowances allocated for the CAIR NO_X units at the source, as submitted by the permitting authority or as determined by the Administrator in accordance with § 96.141(b), for the control period in 2015.

(c) In 2011 and each year thereafter, after the Administrator has made all deductions (if any) from a CAIR NO_X source's compliance account under § 96.154, the Administrator will record in the CAIR NO_X source's compliance account the CAIR NO_X allowances allocated for the CAIR NO_X units at the source, as submitted by the permitting authority or determined by the Administrator in accordance with § 96.141(b), for the control period in the sixth year after the year of the control period for which such deductions were or could have been made.

(d) By December 1, 2009 and December 1 of each year thereafter, the Administrator will record in the CAIR NO_X source's compliance account the CAIR NO_X allowances allocated for the CAIR NO_X units at the source, as submitted by the permitting authority or determined by the Administrator in accordance with § 96.141(c), for the control period in the year of the applicable deadline for recordation under this paragraph.

(e) *Serial numbers for allocated CAIR NO_X allowances. When recording the allocation of CAIR NO_X* allowances for a CAIR NO_X unit in a compliance account, the Administrator will assign each CAIR NO_X allowance a unique identification number that will include digits identifying the year of the control period for which the CAIR NO_X allowance is allocated.

§ 96.154 Compliance with CAIR NO_X emissions limitation.

(a) *Allowance transfer deadline.* The CAIR NO_X allowances are available to be deducted for compliance with a source's CAIR NO_X emissions limitation for a control period in a given calendar year only if the CAIR NO_X allowances:

(1) Were allocated for the control period in the year or a prior year;

(2) Are held in the compliance account as of the allowance transfer deadline for the control period or are transferred into the compliance account by a CAIR NO_X allowance transfer correctly submitted for recordation under § 96.160 by the allowance transfer deadline for the control period; and

(3) Are not necessary for deductions for excess emissions for a prior control period under paragraph (d) of this section.

(b) *Deductions for compliance.* Following the recordation, in accordance with § 96.161, of CAIR NO_X allowance transfers submitted for recordation in a source's compliance account by the allowance transfer deadline for a control period, the Administrator will deduct from the compliance account CAIR NO_X allowances available under paragraph (a) of this section in order to determine whether the source meets the CAIR NO_X emissions limitation for the control period, as follows:

(1) Until the amount of CAIR NO_X allowances deducted equals the number of tons of total nitrogen oxides emissions, determined in accordance with subpart HH of this part, from all CAIR NO_X units at the source for the control period; or

(2) If there are insufficient CAIR NO_X allowances to complete the deductions in paragraph (b)(1) of this section, until no more CAIR NO_X allowances available under paragraph (a) of this section remain in the compliance account.

(c)(1) *Identification of CAIR NO_X allowances by serial number. The CAIR authorized account representative for a source's compliance account may request that specific CAIR NO_X* allowances, identified by serial number, in the compliance account be deducted for emissions or excess emissions for a control period in accordance with paragraph (b) or (d) of this section. Such request shall be submitted to the Administrator by the allowance transfer deadline for the control period and include, in a format prescribed by the Administrator, the identification of the CAIR NO_X source and the appropriate serial numbers.

(2) *First-in, first-out.* The Administrator will deduct CAIR NO_X allowances under paragraph (b) or (d) of this section from the source's compliance account, in the absence of an identification or in the case of a partial identification of CAIR NO_X allowances by serial number under paragraph (c)(1) of this section, on a first-in, first-out (FIFO) accounting basis in the following order:

(i) Any CAIR NO_X allowances that were allocated to the units at the source, in the order of recordation; and then

(ii) Any CAIR NO_X allowances that were allocated to any unit and transferred and recorded in the compliance account pursuant to subpart GG of this part, in the order of recordation.

(d) Deductions for excess emissions.

(1) After making the deductions for compliance under paragraph (b) of this section for a control period in a calendar year in which the CAIR NO_X source has excess emissions, the Administrator will deduct from the source's compliance account an amount of CAIR NO_X allowances, allocated for the control period in the immediately following calendar year, equal to 3 times the number of tons of the source's excess emissions.

(2) Any allowance deduction required under paragraph (d)(1) of this section shall not affect the liability of the owners and operators of the CAIR NO_X source or the CAIR NO_X units at the source for any fine, penalty, or assessment, or their obligation to comply with any other remedy, for the same violations, as ordered under the Clean Air Act or applicable State law.

(e) *Recordation of deductions.* The Administrator will record in the appropriate compliance account all deductions from such an account under paragraph (b) or (d) of this section.

(f) Administrator's action on submissions.

(1) The Administrator may review and conduct independent audits concerning any submission under the CAIR NO_X Annual Trading Program and make appropriate adjustments of the information in the submissions.

(2) The Administrator may deduct CAIR NO_X allowances from or transfer CAIR NO_X allowances to a source's compliance account based on the information in the submissions, as adjusted under paragraph (f)(1) of this section.

§ 96.155 Banking.

(a) CAIR NO_X allowances may be banked for future use or transfer in a compliance account or a general

NMED Exhibit 7f

account in accordance with paragraph (b) of this section.

(b) Any CAIR NO_X allowance that is held in a compliance account or a general account will remain in such account unless and until the CAIR NO_X allowance is deducted or transferred under § 96.154, § 96.156, or subpart GG of this part.

§ 96.156 Account error.

The Administrator may, at his or her sole discretion and on his or her own motion, correct any error in any CAIR NO_X Allowance Tracking System account. Within 10 business days of making such correction, the Administrator will notify the CAIR authorized account representative for the account.

§ 96.157 Closing of general accounts.

(a) The CAIR authorized account representative of a general account may submit to the Administrator a request to close the account, which shall include a correctly submitted allowance transfer under § 96.160 for any CAIR NO_X allowances in the account to one or more other CAIR NO_X Allowance Tracking System accounts.

(b) If a general account has no allowance transfers in or out of the account for a 12-month period or longer and does not contain any CAIR NO_X allowances, the Administrator may notify the CAIR authorized account representative for the account that the account will be closed following 20 business days after the notice is sent. The account will be closed after the 20-day period unless, before the end of the 20-day period, the Administrator receives a correctly submitted transfer of CAIR NO_X allowances into the account under § 96.160 or a statement submitted by the CAIR authorized account representative demonstrating to the satisfaction of the Administrator good cause as to why the account should not be closed.

Subpart GG—CAIR NO_X Allowance Transfers

§ 96.160 Submission of CAIR NO_X allowance transfers.

A CAIR authorized account representative seeking recordation of a CAIR NO_X allowance transfer shall submit the transfer to the Administrator. To be considered correctly submitted, the CAIR NO_X allowance transfer shall include the following elements, in a format specified by the Administrator:

(a) The account numbers for both the transferor and transferee accounts;

(b) The serial number of each CAIR NO_X allowance that is in the transferor account and is to be transferred; and

(c) The name and signature of the CAIR authorized account representative of the transferor account and the date signed.

§ 96.161 EPA recordation.

(a) Within 5 business days (except as provided in paragraph (b) of this section) of receiving a CAIR NO_X allowance transfer, the Administrator will record a CAIR NO_X allowance transfer by moving each CAIR NO_X allowance from the transferor account to the transferee account as specified by the request, provided that:

(1) The transfer is correctly submitted under § 96.160; and

(2) The transferor account includes each CAIR NO_X allowance identified by serial number in the transfer.

(b) A CAIR NO_X allowance transfer that is submitted for recordation after the allowance transfer deadline for a control period and that includes any CAIR NO_X allowances allocated for any control period before such allowance transfer deadline will not be recorded until after the Administrator completes the deductions under § 96.154 for the control period immediately before such allowance transfer deadline.

(c) Where a CAIR NO_X allowance transfer submitted for recordation fails to meet the requirements of paragraph (a) of this section, the Administrator will not record such transfer.

§ 96.162 Notification.

(a) *Notification of recordation.* Within 5 business days of recordation of a CAIR NO_X allowance transfer under § 96.161, the Administrator will notify the CAIR authorized account representatives of both the transferor and transferee accounts.

(b) *Notification of non-recordation.* Within 10 business days of receipt of a CAIR NO_X allowance transfer that fails to meet the requirements of § 96.161(a), the Administrator will notify the CAIR authorized account representatives of both accounts subject to the transfer of:

(1) A decision not to record the transfer, and

(2) The reasons for such non-recordation.

(c) Nothing in this section shall preclude the submission of a CAIR NO_X allowance transfer for recordation following notification of non-recordation.

Subpart HH—Monitoring and Reporting

§ 96.170 General requirements.

The owners and operators, and to the extent applicable, the CAIR designated representative, of a CAIR NO_X unit, shall comply with the monitoring, recordkeeping, and reporting requirements as provided in this subpart and in subpart H of part 75 of this chapter. For purposes of complying with such requirements, the definitions in § 96.102 and in § 72.2 of this chapter shall apply, and the terms ''affected unit,'' ''designated representative,'' and ''continuous emission monitoring system'' (or ''CEMS'') in part 75 of this chapter shall be deemed to refer to the terms ''CAIR NO_X unit,'' ''CAIR designated representative,'' and ''continuous emission monitoring system'' (or ''CEMS'') respectively, as defined in § 96.102. The owner or operator of a unit that is not a CAIR NO_X unit but that is monitored under § 75.72(b)(2)(ii) of this chapter shall comply with the same monitoring, recordkeeping, and reporting requirements as a CAIR NO_X unit.

(a) *Requirements for installation, certification, and data accounting.* The owner or operator of each CAIR NO_X unit shall:

(1) Install all monitoring systems required under this subpart for monitoring NO_X mass emissions and individual unit heat input (including all systems required to monitor NO_X emission rate, NO_X concentration, stack gas moisture content, stack gas flow rate, CO_2 or O_2 concentration, and fuel flow rate, as applicable, in accordance with §§ 75.71 and 75.72 of this chapter);

(2) Successfully complete all certification tests required under § 96.171 and meet all other requirements of this subpart and part 75 of this chapter applicable to the monitoring systems under paragraph (a)(1) of this section; and

(3) Record, report, and quality-assure the data from the monitoring systems under paragraph (a)(1) of this section.

(b) *Compliance deadlines.* The owner or operator shall meet the monitoring system certification and other requirements of paragraphs (a)(1) and (2) of this section on or before the following dates. The owner or operator shall record, report, and quality-assure the data from the monitoring systems under paragraph (a)(1) of this section on and after the following dates.

(1) For the owner or operator of a CAIR NO_X unit that commences commercial operation before July 1, 2007, by January 1, 2008.

(2) For the owner or operator of a CAIR NO_X unit that commences commercial operation on or after July 1, 2007, by the later of the following dates:

(i) January 1, 2008; or

(ii) 90 unit operating days or 180 calendar days, whichever occurs first, after the date on which the unit commences commercial operation.

(3) For the owner or operator of a CAIR NO_X unit for which construction of a new stack or flue or installation of add-on NO_X emission controls is completed after the applicable deadline under paragraph (b)(1), (2), (4), or (5) of this section, by 90 unit operating days or 180 calendar days, whichever occurs first, after the date on which emissions first exit to the atmosphere through the new stack or flue or add-on NO_X emissions controls.

(4) Notwithstanding the dates in paragraphs (b)(1) and (2) of this section, for the owner or operator of a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart II of this part, by the date specified in § 96.184(b).

(5) Notwithstanding the dates in paragraphs (b)(1), (2), and (4) of this section and solely for purposes of § 96.106(c)(2), for the owner or operator of a CAIR NO_X opt-in unit under subpart II of this part, by the date on which the CAIR NO_X opt-in unit enters the CAIR NO_X Annual Trading Program as provided in § 96.184(g).

(c) *Reporting data.* (1) Except as provided in paragraph (c)(2) of this section, the owner or operator of a CAIR NO_X unit that does not meet the applicable compliance date set forth in paragraph (b) of this section for any monitoring system under paragraph (a)(1) of this section shall, for each such monitoring system, determine, record, and report maximum potential (or, as appropriate, minimum potential) values for NO_X concentration, NO_X emission rate, stack gas flow rate, stack gas moisture content, fuel flow rate, and any other parameters required to determine NO_X mass emissions and heat input in accordance with § 75.31(b)(2) or (c)(3) of this chapter, section 2.4 of appendix D to part 75 of this chapter, or section 2.5 of appendix E to part 75 of this chapter, as applicable.

(2) The owner or operator of a CAIR NO_X unit that does not meet the applicable compliance date set forth in paragraph (b)(3) of this section for any monitoring system under paragraph (a)(1) of this section shall, for each such monitoring system, determine, record, and report substitute data using the applicable missing data procedures in subpart D or subpart H of, or appendix D or appendix E to, part 75 of this chapter, in lieu of the maximum potential (or, as appropriate, minimum potential) values, for a parameter if the owner or operator demonstrates that there is continuity between the data streams for that parameter before and after the construction or installation under paragraph (b)(3) of this section.

(d) *Prohibitions.* (1) No owner or operator of a CAIR NO_X unit shall use any alternative monitoring system, alternative reference method, or any other alternative to any requirement of this subpart without having obtained prior written approval in accordance with § 96.175.

(2) No owner or operator of a CAIR NO_X unit shall operate the unit so as to discharge, or allow to be discharged, NO_X emissions to the atmosphere without accounting for all such emissions in accordance with the applicable provisions of this subpart and part 75 of this chapter.

(3) No owner or operator of a CAIR NO_X unit shall disrupt the continuous emission monitoring system, any portion thereof, or any other approved emission monitoring method, and thereby avoid monitoring and recording NO_X mass emissions discharged into the atmosphere, except for periods of recertification or periods when calibration, quality assurance testing, or maintenance is performed in accordance with the applicable provisions of this subpart and part 75 of this chapter.

(4) No owner or operator of a CAIR NO_X unit shall retire or permanently discontinue use of the continuous emission monitoring system, any component thereof, or any other approved monitoring system under this subpart, except under any one of the following circumstances:

(i) During the period that the unit is covered by an exemption under § 96.105 that is in effect;

(ii) The owner or operator is monitoring emissions from the unit with another certified monitoring system approved, in accordance with the applicable provisions of this subpart and part 75 of this chapter, by the permitting authority for use at that unit that provides emission data for the same pollutant or parameter as the retired or discontinued monitoring system; or

(iii) The CAIR designated representative submits notification of the date of certification testing of a replacement monitoring system for the retired or discontinued monitoring system in accordance with § 96.171(d)(3)(i).

§ 96.171 Initial certification and recertification procedures.

(a) The owner or operator of a CAIR NO_X unit shall be exempt from the initial certification requirements of this section for a monitoring system under § 96.170(a)(1) if the following conditions are met:

(1) The monitoring system has been previously certified in accordance with part 75 of this chapter; and

(2) The applicable quality-assurance and quality-control requirements of § 75.21 of this chapter and appendix B, appendix D, and appendix E to part 75 of this chapter are fully met for the certified monitoring system described in paragraph (a)(1) of this section.

(b) The recertification provisions of this section shall apply to a monitoring system under § 96.170(a)(1) exempt from initial certification requirements under paragraph (a) of this section.

(c) If the Administrator has previously approved a petition under § 75.17(a) or (b) of this chapter for apportioning the NO_X emission rate measured in a common stack or a petition under § 75.66 of this chapter for an alternative to a requirement in § 75.12, § 75.17, or subpart H of part 75 of this chapter, the CAIR designated representative shall resubmit the petition to the Administrator under § 96.175(a) to determine whether the approval applies under the CAIR NO_X Annual Trading Program.

(d) Except as provided in paragraph (a) of this section, the owner or operator of a CAIR NO_X unit shall comply with the following initial certification and recertification procedures for a continuous monitoring system (*i.e.*, a continuous emission monitoring system and an excepted monitoring system under appendices D and E to part 75 of this chapter) under § 96.170(a)(1). The owner or operator of a unit that qualifies to use the low mass emissions excepted monitoring methodology under § 75.19 of this chapter or that qualifies to use an alternative monitoring system under subpart E of part 75 of this chapter shall comply with the procedures in paragraph (e) or (f) of this section respectively.

(1) *Requirements for initial certification.* The owner or operator shall ensure that each continuous monitoring system under § 96.170(a)(1)(including the automated data acquisition and handling system) successfully completes all of the initial certification testing required under § 75.20 of this chapter by the applicable deadline in § 96.170(b). In addition, whenever the owner or operator installs a monitoring system to meet the requirements of this subpart in a location where no such monitoring system was previously installed, initial certification in accordance with § 75.20 of this chapter is required.

(2) Requirements for recertification. Whenever the owner or operator makes a replacement, modification, or change in any certified continuous emission

NMED Exhibit 7f

monitoring system under § 96.170(a)(1) that may significantly affect the ability of the system to accurately measure or record NO_X mass emissions or heat input rate or to meet the quality-assurance and quality-control requirements of § 75.21 of this chapter or appendix B to part 75 of this chapter, the owner or operator shall recertify the monitoring system in accordance with § 75.20(b) of this chapter. Furthermore, whenever the owner or operator makes a replacement, modification, or change to the flue gas handling system or the unit's operation that may significantly change the stack flow or concentration profile, the owner or operator shall recertify each continuous emission monitoring system whose accuracy is potentially affected by the change, in accordance with § 75.20(b) of this chapter. Examples of changes to a continuous emission monitoring system that require recertification include replacement of the analyzer, complete replacement of an existing continuous emission monitoring system, or change in location or orientation of the sampling probe or site. Any fuel flowmeter system, and any excepted NO_X monitoring system under appendix E to part 75 of this chapter, under § 96.170(a)(1) are subject to the recertification requirements in § 75.20(g)(6) of this chapter.

(3) *Approval process for initial certification and recertification.* Paragraphs (d)(3)(i) through (iv) of this section apply to both initial certification and recertification of a continuous monitoring system under § 96.170(a)(1). For recertifications, replace the words ''certification'' and ''initial certification'' with the word ''recertification'', replace the word ''certified'' with the word ''recertified,'' and follow the procedures in §§ 75.20(b)(5) and (g)(7) of this chapter in lieu of the procedures in paragraph (d)(3)(v) of this section.

(i) *Notification of certification.* The CAIR designated representative shall submit to the permitting authority, the appropriate EPA Regional Office, and the Administrator written notice of the dates of certification testing, in accordance with § 96.173.

(ii) *Certification application.* The CAIR designated representative shall submit to the permitting authority a certification application for each monitoring system. A complete certification application shall include the information specified in § 75.63 of this chapter.

(iii) *Provisional certification date.* The provisional certification date for a monitoring system shall be determined in accordance with § 75.20(a)(3) of this chapter. A provisionally certified monitoring system may be used under the CAIR NO_X Annual Trading Program for a period not to exceed 120 days after receipt by the permitting authority of the complete certification application for the monitoring system under paragraph (d)(3)(ii) of this section. Data measured and recorded by the provisionally certified monitoring system, in accordance with the requirements of part 75 of this chapter, will be considered valid quality-assured data (retroactive to the date and time of provisional certification), provided that the permitting authority does not invalidate the provisional certification by issuing a notice of disapproval within 120 days of the date of receipt of the complete certification application by the permitting authority.

(iv) *Certification application approval process.* The permitting authority will issue a written notice of approval or disapproval of the certification application to the owner or operator within 120 days of receipt of the complete certification application under paragraph (d)(3)(ii) of this section. In the event the permitting authority does not issue such a notice within such 120-day period, each monitoring system that meets the applicable performance requirements of part 75 of this chapter and is included in the certification application will be deemed certified for use under the CAIR NO_X Annual Trading Program.

(A) *Approval notice*. If the certification application is complete and shows that each monitoring system meets the applicable performance requirements of part 75 of this chapter, then the permitting authority will issue a written notice of approval of the certification application within 120 days of receipt.

(B) *Incomplete application notice*. If the certification application is not complete, then the permitting authority will issue a written notice of incompleteness that sets a reasonable date by which the CAIR designated representative must submit the additional information required to complete the certification application. If the CAIR designated representative does not comply with the notice of incompleteness by the specified date, then the permitting authority may issue a notice of disapproval under paragraph (d)(3)(iv)(C) of this section. The 120-day review period shall not begin before receipt of a complete certification application.

(C) *Disapproval notice.* If the certification application shows that any monitoring system does not meet the performance requirements of part 75 of this chapter or if the certification application is incomplete and the requirement for disapproval under paragraph (d)(3)(iv)(B) of this section is met, then the permitting authority will issue a written notice of disapproval of the certification application. Upon issuance of such notice of disapproval, the provisional certification is invalidated by the permitting authority and the data measured and recorded by each uncertified monitoring system shall not be considered valid quality-assured data beginning with the date and hour of provisional certification (as defined under § 75.20(a)(3) of this chapter). The owner or operator shall follow the procedures for loss of certification in paragraph (d)(3)(v) of this section for each monitoring system that is disapproved for initial certification.

(D) *Audit decertification.* The permitting authority or, for a CAIR NO_X opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart II of this part, the Administrator may issue a notice of disapproval of the certification status of a monitor in accordance with § 96.172(b).

(v) *Procedures for loss of certification.* If the permitting authority or the Administrator issues a notice of disapproval of a certification application under paragraph (d)(3)(iv)(C) of this section or a notice of disapproval of certification status under paragraph (d)(3)(iv)(D) of this section, then:

(A) The owner or operator shall substitute the following values, for each disapproved monitoring system, for each hour of unit operation during the period of invalid data specified under § 75.20(a)(4)(iii), § 75.20(g)(7), or § 75.21(e) of this chapter and continuing until the applicable date and hour specified under § 75.20(a)(5)(i) or (g)(7) of this chapter:

(1) For a disapproved NO_X emission rate (*i.e.*, NO_X-diluent) system, the maximum potential NO_X emission rate, as defined in § 72.2 of this chapter.

(2) For a disapproved NO_X pollutant concentration monitor and disapproved flow monitor, respectively, the maximum potential concentration of NO_X and the maximum potential flow rate, as defined in sections 2.1.2.1 and 2.1.4.1 of appendix A to part 75 of this chapter.

(3) For a disapproved moisture monitoring system and disapproved diluent gas monitoring system, respectively, the minimum potential moisture percentage and either the maximum potential CO_2 concentration or the minimum potential O_2

NMED Exhibit 7f

concentration (as applicable), as defined in sections 2.1.5, 2.1.3.1, and 2.1.3.2 of appendix A to part 75 of this chapter.

(4) For a disapproved fuel flowmeter system, the maximum potential fuel flow rate, as defined in section 2.4.2.1 of appendix D to part 75 of this chapter.

(5) For a disapproved excepted NO_X monitoring system under appendix E to part 75 of this chapter, the fuel-specific maximum potential NO_X emission rate, as defined in § 72.2 of this chapter.

(B) The CAIR designated representative shall submit a notification of certification retest dates and a new certification application in accordance with paragraphs (d)(3)(i) and (ii) of this section.

(C) The owner or operator shall repeat all certification tests or other requirements that were failed by the monitoring system, as indicated in the permitting authority's or the Administrator's notice of disapproval, no later than 30 unit operating days after the date of issuance of the notice of disapproval.

(e) *Initial certification and recertification procedures for units using the low mass emission excepted methodology under § 75.19 of this chapter.* The owner or operator of a unit qualified to use the low mass emissions (LME) excepted methodology under § 75.19 of this chapter shall meet the applicable certification and recertification requirements in §§ 75.19(a)(2) and 75.20(h) of this chapter. If the owner or operator of such a unit elects to certify a fuel flowmeter system for heat input determination, the owner or operator shall also meet the certification and recertification requirements in § 75.20(g) of this chapter.

(f) *Certification/recertification procedures for alternative monitoring systems.* The CAIR designated representative of each unit for which the owner or operator intends to use an alternative monitoring system approved by the Administrator and, if applicable, the permitting authority under subpart E of part 75 of this chapter shall comply with the applicable notification and application procedures of § 75.20(f) of this chapter.

§ 96.172 Out of control periods.

(a) Whenever any monitoring system fails to meet the quality-assurance and quality-control requirements or data validation requirements of part 75 of this chapter, data shall be substituted using the applicable missing data procedures in subpart D or subpart H of, or appendix D or appendix E to, part 75 of this chapter.

(b) *Audit decertification.* Whenever both an audit of a monitoring system and a review of the initial certification or recertification application reveal that any monitoring system should not have been certified or recertified because it did not meet a particular performance specification or other requirement under § 96.171 or the applicable provisions of part 75 of this chapter, both at the time of the initial certification or recertification application submission and at the time of the audit, the permitting authority or, for a CAIR NO_X opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart II of this part, the Administrator will issue a notice of disapproval of the certification status of such monitoring system. For the purposes of this paragraph, an audit shall be either a field audit or an audit of any information submitted to the permitting authority or the Administrator. By issuing the notice of disapproval, the permitting authority or the Administrator revokes prospectively the certification status of the monitoring system. The data measured and recorded by the monitoring system shall not be considered valid quality-assured data from the date of issuance of the notification of the revoked certification status until the date and time that the owner or operator completes subsequently approved initial certification or recertification tests for the monitoring system. The owner or operator shall follow the applicable initial certification or recertification procedures in § 96.171 for each disapproved monitoring system.

§ 96.173 Notifications.

The CAIR designated representative for a CAIR NO_X unit shall submit written notice to the permitting authority and the Administrator in accordance with § 75.61 of this chapter, except that if the unit is not subject to an Acid Rain emissions limitation, the notification is only required to be sent to the permitting authority.

§ 96.174 Recordkeeping and reporting.

(a) *General provisions.* The CAIR designated representative shall comply with all recordkeeping and reporting requirements in this section, the applicable recordkeeping and reporting requirements under § 75.73 of this chapter, and the requirements of § 96.110(e)(1).

(b) *Monitoring Plans.* The owner or operator of a CAIR NO_X unit shall comply with requirements of § 75.73(c) and (e) of this chapter and, for a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart II of this part, §§ 96.183 and 96.184(a).

(c) *Certification Applications.* The CAIR designated representative shall submit an application to the permitting authority within 45 days after completing all initial certification or recertification tests required under § 96.171, including the information required under § 75.63 of this chapter.

(d) *Quarterly reports.* The CAIR designated representative shall submit quarterly reports, as follows:

(1) The CAIR designated representative shall report the NO_X mass emissions data and heat input data for the CAIR NO_X unit, in an electronic quarterly report in a format prescribed by the Administrator, for each calendar quarter beginning with:

(i) For a unit that commences commercial operation before July 1, 2007, the calendar quarter covering January 1, 2008 through March 31, 2008; or

(ii) For a unit that commences commercial operation on or after July 1, 2007, the calendar quarter corresponding to the earlier of the date of provisional certification or the applicable deadline for initial certification under § 96.170(b), unless that quarter is the third or fourth quarter of 2007, in which case reporting shall commence in the quarter covering January 1, 2008 through March 31, 2008.

(2) The CAIR designated representative shall submit each quarterly report to the Administrator within 30 days following the end of the calendar quarter covered by the report. Quarterly reports shall be submitted in the manner specified in § 75.73(f) of this chapter.

(3) For CAIR NO_X units that are also subject to an Acid Rain emissions limitation or the CAIR NO_X Ozone Season Trading Program or CAIR SO_2 Trading Program, quarterly reports shall include the applicable data and information required by subparts F through H of part 75 of this chapter as applicable, in addition to the NO_X mass emission data, heat input data, and other information required by this subpart.

(e) *Compliance certification.* The CAIR designated representative shall submit to the Administrator a compliance certification (in a format prescribed by the Administrator) in support of each quarterly report based on reasonable inquiry of those persons with primary responsibility for ensuring that all of the unit's emissions are correctly and fully monitored. The certification shall state that:

(1) The monitoring data submitted were recorded in accordance with the applicable requirements of this subpart and part 75 of this chapter, including the quality assurance procedures and specifications; and

(2) For a unit with add-on NO_X emission controls and for all hours where NO_X data are substituted in accordance with § 75.34(a)(1) of this chapter, the add-on emission controls were operating within the range of parameters listed in the quality assurance/quality control program under appendix B to part 75 of this chapter and the substitute data values do not systematically underestimate NO_X emissions.

§ 96.175 Petitions.

(a) Except as provided in paragraph (b)(2) of this section, the CAIR designated representative of a CAIR NO_X unit that is subject to an Acid Rain emissions limitation may submit a petition under § 75.66 of this chapter to the Administrator requesting approval to apply an alternative to any requirement of this subpart. Application of an alternative to any requirement of this subpart is in accordance with this subpart only to the extent that the petition is approved in writing by the Administrator, in consultation with the permitting authority.

(b)(1) The CAIR designated representative of a CAIR NO_X unit that is not subject to an Acid Rain emissions limitation may submit a petition under § 75.66 of this chapter to the permitting authority and the Administrator requesting approval to apply an alternative to any requirement of this subpart. Application of an alternative to any requirement of this subpart is in accordance with this subpart only to the extent that the petition is approved in writing by both the permitting authority and the Administrator.

(2) The CAIR designated representative of a CAIR NO_X unit that is subject to an Acid Rain emissions limitation may submit a petition under § 75.66 of this chapter to the permitting authority and the Administrator requesting approval to apply an alternative to a requirement concerning any additional continuous emission monitoring system required under § 75.72 of this chapter. Application of an alternative to any such requirement is in accordance with this subpart only to the extent that the petition is approved in writing by both the permitting authority and the Administrator.

§ 96.176 Additional requirements to provide heat input data.

The owner or operator of a CAIR NO_X unit that monitors and reports NO_X mass emissions using a NO_X concentration system and a flow system shall also monitor and report heat input rate at the unit level using the procedures set forth in part 75 of this chapter.

Subpart II—CAIR NO_X Opt-in Units

§ 96.180 Applicability.

A CAIR NO_X opt-in unit must be a unit that:

(a) Is located in the State;

(b) Is not a CAIR NO_X unit under § 96.104 and is not covered by a retired unit exemption under § 96.105 that is in effect;

(c) Is not covered by a retired unit exemption under § 72.8 of this chapter that is in effect;

(d) Has or is required or qualified to have a title V operating permit or other federally enforceable permit; and

(e) Vents all of its emissions to a stack and can meet the monitoring, recordkeeping, and reporting requirements of subpart HH of this part.

§ 96.181 General.

(a) Except as otherwise provided in §§ 96.101 through 96.104, §§ 96.106 through 96.108, and subparts BB and CC and subparts FF through HH of this part, a CAIR NO_X opt-in unit shall be treated as a CAIR NO_X unit for purposes of applying such sections and subparts of this part.

(b) Solely for purposes of applying, as provided in this subpart, the requirements of subpart HH of this part to a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under this subpart, such unit shall be treated as a CAIR NO_X unit before issuance of a CAIR opt-in permit for such unit.

§ 96.182 CAIR designated representative.

Any CAIR NO_X opt-in unit, and any unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under this subpart, located at the same source as one or more CAIR NO_X units shall have the same CAIR designated representative and alternate CAIR designated representative as such CAIR NO_X units.

§ 96.183 Applying for CAIR opt-in permit.

(a) *Applying for initial CAIR opt-in permit.* The CAIR designated representative of a unit meeting the requirements for a CAIR NO_X opt-in unit in § 96.180 may apply for an initial CAIR opt-in permit at any time, except as provided under § 96.186(f) and (g), and, in order to apply, must submit the following:

(1) A complete CAIR permit application under § 96.122;

(2) A certification, in a format specified by the permitting authority, that the unit:

(i) Is not a CAIR NO_X unit under § 96.104 and is not covered by a retired unit exemption under § 96.105 that is in effect;

(ii) Is not covered by a retired unit exemption under § 72.8 of this chapter that is in effect;

(iii) Vents all of its emissions to a stack, and

(iv) Has documented heat input for more than 876 hours during the 6 months immediately preceding submission of the CAIR permit application under § 96.122;

(3) A monitoring plan in accordance with subpart HH of this part;

(4) A complete certificate of representation under § 96.113 consistent with § 96.182, if no CAIR designated representative has been previously designated for the source that includes the unit; and

(5) A statement, in a format specified by the permitting authority, whether the CAIR designated representative requests that the unit be allocated CAIR NO_X allowances under § 96.188(c) (subject to the conditions in §§ 96.184(h) and 96.186(g)).

(b) *Duty to reapply.* (1) The CAIR designated representative of a CAIR NO_X opt-in unit shall submit a complete CAIR permit application under § 96.122 to renew the CAIR opt-in unit permit in accordance with the permitting authority's regulations for title V operating permits, or the permitting authority's regulations for other federally enforceable permits if applicable, addressing permit renewal.

(2) Unless the permitting authority issues a notification of acceptance of withdrawal of the CAIR opt-in unit from the CAIR NO_X Annual Trading Program in accordance with § 96.186 or the unit becomes a CAIR NO_X unit under § 96.104, the CAIR NO_X opt-in unit shall remain subject to the requirements for a CAIR NO_X opt-in unit, even if the CAIR designated representative for the CAIR NO_X opt-in unit fails to submit a CAIR permit application that is required for renewal of the CAIR opt-in permit under paragraph (b)(1) of this section.

§ 96.184 Opt-in process.

The permitting authority will issue or deny a CAIR opt-in permit for a unit for which an initial application for a CAIR opt-in permit under § 96.183 is submitted in accordance with the following:

(a) Interim review of monitoring plan. The permitting authority and the Administrator will determine, on an interim basis, the sufficiency of the monitoring plan accompanying the initial application for a CAIR opt-in permit under § 96.183. A monitoring plan is sufficient, for purposes of interim review, if the plan appears to contain information demonstrating that the NO_X emissions rate and heat input of the unit and all other applicable parameters are monitored and reported in accordance with subpart HH of this part. A determination of sufficiency shall not be construed as acceptance or approval of the monitoring plan.

(b) *Monitoring and reporting.* (1)(i) If the permitting authority and the Administrator determine that the monitoring plan is sufficient under paragraph (a) of this section, the owner or operator shall monitor and report the NO_X emissions rate and the heat input of the unit and all other applicable parameters, in accordance with subpart HH of this part, starting on the date of certification of the appropriate monitoring systems under subpart HH of this part and continuing until a CAIR opt-in permit is denied under § 96.184(f) or, if a CAIR opt-in permit is issued, the date and time when the unit is withdrawn from the CAIR NO_X Annual Trading Program in accordance with § 96.186.

(ii) The monitoring and reporting under paragraph (b)(1)(i) of this section shall include the entire control period immediately before the date on which the unit enters the CAIR NO_X Annual Trading Program under § 96.184(g), during which period monitoring system availability must not be less than 90 percent under subpart HH of this part and the unit must be in full compliance with any applicable State or Federal emissions or emissions-related requirements.

(2) To the extent the NO_X emissions rate and the heat input of the unit are monitored and reported in accordance with subpart HH of this part for one or more control periods, in addition to the control period under paragraph (b)(1)(ii) of this section, during which control periods monitoring system availability is not less than 90 percent under subpart HH of this part and the unit is in full compliance with any applicable State or Federal emissions or emissions-related requirements and which control periods begin not more than 3 years before the unit enters the CAIR NO_X Annual Trading Program under § 96.184(g), such information shall be used as provided in paragraphs (c) and (d) of this section.

(c) *Baseline heat input.* The unit's baseline heat rate shall equal:

(1) If the unit's NO_X emissions rate and heat input are monitored and reported for only one control period, in accordance with paragraph (b)(1) of this section, the unit's total heat input (in mmBtu) for the control period; or

(2) If the unit's NO_X emissions rate and heat input are monitored and reported for more than one control period, in accordance with paragraphs (b)(1) and (2) of this section, the average of the amounts of the unit's total heat input (in mmBtu) for the control period under paragraph (b)(1)(ii) of this section and for the control periods under paragraph (b)(2) of this section.

(d) *Baseline NO_X emission rate.* The unit's baseline NO_X emission rate shall equal:

(1) If the unit's NO_X emissions rate and heat input are monitored and reported for only one control period, in accordance with paragraph (b)(1) of this section, the unit's NO_X emissions rate (in lb/mmBtu) for the control period;

(2) If the unit's NO_X emissions rate and heat input are monitored and reported for more than one control period, in accordance with paragraphs (b)(1) and (2) of this section, and the unit does not have add-on NO_X emission controls during any such control periods, the average of the amounts of the unit's NO_X emissions rate (in lb/mmBtu) for the control period under paragraph (b)(1)(ii) of this section and the control periods under paragraph (b)(2) of this section; or

(3) If the unit's NO_X emissions rate and heat input are monitored and reported for more than one control period, in accordance with paragraphs (b)(1) and (2) of this section, and the unit has add-on NO_X emission controls during any such control periods, the average of the amounts of the unit's NO_X emissions rate (in lb/mmBtu) for such control period during which the unit has add-on NO_X emission controls.

(e) Issuance of CAIR opt-in permit. After calculating the baseline heat input and the baseline NO_X emissions rate for the unit under paragraphs (c) and (d) of this section and if the permitting authority determines that the CAIR designated representative shows that the unit meets the requirements for a CAIR NO_X opt-in unit in § 96.180 and meets the elements certified in § 96.183(a)(2), the permitting authority will issue a CAIR opt-in permit. The permitting authority will provide a copy of the CAIR opt-in permit to the Administrator, who will then establish a compliance account for the source that includes the CAIR NO_X opt-in unit unless the source already has a compliance account.

(f) *Issuance of denial of CAIR opt-in permit.* Notwithstanding paragraphs (a) through (e) of this section, if at any time before issuance of a CAIR opt-in permit for the unit, the permitting authority determines that the CAIR designated representative fails to show that the unit meets the requirements for a CAIR NO_X opt-in unit in § 96.180 or meets the elements certified in § 96.183(a)(2), the permitting authority will issue a denial of a CAIR NO_X opt-in permit for the unit.

(g) *Date of entry into CAIR NO_X Annual Trading Program.* A unit for which an initial CAIR opt-in permit is issued by the permitting authority shall become a CAIR NO_X opt-in unit, and a CAIR NO_X unit, as of the later of January 1, 2009 or January 1 of the first control period during which such CAIR opt-in permit is issued.

(h) *Repowered CAIR NO_X opt-in unit.* (1) If CAIR designated representative requests, and the permitting authority issues a CAIR opt-in permit providing for, allocation to a CAIR NO_X opt-in unit of CAIR NO_X allowances under § 96.188(c) and such unit is repowered after its date of entry into the CAIR NO_X Annual Trading Program under paragraph (g) of this section, the repowered unit shall be treated as a CAIR NO_X opt-in unit replacing the original CAIR NO_X opt-in unit, as of the date of start-up of the repowered unit's combustion chamber.

(2) Notwithstanding paragraphs (c) and (d) of this section, as of the date of start-up under paragraph (h)(1) of this section, the repowered unit shall be deemed to have the same date of commencement of operation, date of commencement of commercial operation, baseline heat input, and baseline NO_X emission rate as the original CAIR NO_X opt-in unit, and the original CAIR NO_X opt-in unit shall no longer be treated as a CAIR opt-in unit or a CAIR NO_X unit.

§ 96.185 CAIR opt-in permit contents.

(a) Each CAIR opt-in permit will contain:

(1) All elements required for a complete CAIR permit application under § 96.122;

(2) The certification in § 96.183(a)(2);

(3) The unit's baseline heat input under § 96.184(c);

(4) The unit's baseline NO_X emission rate under § 96.184(d);

(5) A statement whether the unit is to be allocated CAIR NO_X allowances under § 96.188(c) (subject to the

NMED Exhibit 7f

conditions in §§ 96.184(h) and 96.186(g));

(6) A statement that the unit may withdraw from the CAIR NO_X Annual Trading Program only in accordance with § 96.186; and

(7) A statement that the unit is subject to, and the owners and operators of the unit must comply with, the requirements of § 96.187.

(b) Each CAIR opt-in permit is deemed to incorporate automatically the definitions of terms under § 96.102 and, upon recordation by the Administrator under subpart FF or GG of this part or this subpart, every allocation, transfer, or deduction of CAIR NO_X allowances to or from the compliance account of the source that includes a CAIR NO_X opt-in unit covered by the CAIR opt-in permit.

§ 96.186 Withdrawal from CAIR NO_X Annual Trading Program.

Except as provided under paragraph (g) of this section, a CAIR NO_X opt-in unit may withdraw from the CAIR NO_X Annual Trading Program, but only if the permitting authority issues a notification to the CAIR designated representative of the CAIR NO_X opt-in unit of the acceptance of the withdrawal of the CAIR NO_X opt-in unit in accordance with paragraph (d) of this section.

(a) *Requesting withdrawal.* In order to withdraw a CAIR opt-in unit from the CAIR NO_X Annual Trading Program, the CAIR designated representative of the CAIR NO_X opt-in unit shall submit to the permitting authority a request to withdraw effective as of midnight of December 31 of a specified calendar year, which date must be at least 4 years after December 31 of the year of entry into the CAIR NO_X Annual Trading Program under § 96.184(g). The request must be submitted no later than 90 days before the requested effective date of withdrawal.

(b) *Conditions for withdrawal.* Before a CAIR NO_X opt-in unit covered by a request under paragraph (a) of this section may withdraw from the CAIR NO_X Annual Trading Program and the CAIR opt-in permit may be terminated under paragraph (e) of this section, the following conditions must be met:

(1) For the control period ending on the date on which the withdrawal is to be effective, the source that includes the CAIR NO_X opt-in unit must meet the requirement to hold CAIR NO_X allowances under § 96.106(c) and cannot have any excess emissions.

(2) After the requirement for withdrawal under paragraph (b)(1) of this section is met, the Administrator will deduct from the compliance account of the source that includes the CAIR NO_X opt-in unit CAIR NO_X allowances equal in number to and allocated for the same or a prior control period as any CAIR NO_X allowances allocated to the CAIR NO_X opt-in unit under § 96.188 for any control period for which the withdrawal is to be effective. If there are no remaining CAIR NO_X units at the source, the Administrator will close the compliance account, and the owners and operators of the CAIR NO_X opt-in unit may submit a CAIR NO_X allowance transfer for any remaining CAIR NO_X allowances to another CAIR NO_X Allowance Tracking System in accordance with subpart GG of this part.

(c) *Notification.* (1) After the requirements for withdrawal under paragraphs (a) and (b) of this section are met (including deduction of the full amount of CAIR NO_X allowances required), the permitting authority will issue a notification to the CAIR designated representative of the CAIR NO_X opt-in unit of the acceptance of the withdrawal of the CAIR NO_X opt-in unit as of midnight on December 31 of the calendar year for which the withdrawal was requested.

(2) If the requirements for withdrawal under paragraphs (a) and (b) of this section are not met, the permitting authority will issue a notification to the CAIR designated representative of the CAIR NO_X opt-in unit that the CAIR NO_X opt-in unit's request to withdraw is denied. Such CAIR NO_X opt-in unit shall continue to be a CAIR NO_X opt-in unit.

(d) *Permit amendment.* After the permitting authority issues a notification under paragraph (c)(1) of this section that the requirements for withdrawal have been met, the permitting authority will revise the CAIR permit covering the CAIR NO_X opt-in unit to terminate the CAIR opt-in permit for such unit as of the effective date specified under paragraph (c)(1) of this section. The unit shall continue to be a CAIR NO_X opt-in unit until the effective date of the termination and shall comply with all requirements under the CAIR NO_X Annual Trading Program concerning any control periods for which the unit is a CAIR NO_X opt-in unit, even if such requirements arise or must be complied with after the withdrawal takes effect.

(e) *Reapplication upon failure to meet conditions of withdrawal.* If the permitting authority denies the CAIR NO_X opt-in unit's request to withdraw, the CAIR designated representative may submit another request to withdraw in accordance with paragraphs (a) and (b) of this section.

(f) *Ability to reapply to the CAIR NO_X Annual Trading Program.* Once a CAIR NO_X opt-in unit withdraws from the CAIR NO_X Annual Trading Program and its CAIR opt-in permit is terminated under this section, the CAIR designated representative may not submit another application for a CAIR opt-in permit under § 96.183 for such CAIR NO_X opt-in unit before the date that is 4 years after the date on which the withdrawal became effective. Such new application for a CAIR opt-in permit will be treated as an initial application for a CAIR opt- in permit under § 96.184.

(g) Inability to withdraw. Notwithstanding paragraphs (a) through (f) of this section, a CAIR NO_X opt-in unit shall not be eligible to withdraw from the CAIR NO_X Annual Trading Program if the CAIR designated representative of the CAIR NO_X opt-in unit requests, and the permitting authority issues a CAIR NO_X opt-in permit providing for, allocation to the CAIR NO_X opt-in unit of CAIR NO_X allowances under § 96.188(c).

§ 96.187 Change in regulatory status.

(a) *Notification.* If a CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104, then the CAIR designated representative shall notify in writing the permitting authority and the Administrator of such change in the CAIR NO_X opt-in unit's regulatory status, within 30 days of such change.

(b) Permitting authority's and Administrator's actions.

(1) If a CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104, the permitting authority will revise the CAIR NO_X opt-in unit's CAIR opt-in permit to meet the requirements of a CAIR permit under § 96.123 as of the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104.

(2)(i) The Administrator will deduct from the compliance account of the source that includes the CAIR NO_X opt-in unit that becomes a CAIR NO_X unit under § 96.104, CAIR NO_X allowances equal in number to and allocated for the same or a prior control period as:

(A) Any CAIR NO_X allowances allocated to the CAIR NO_X opt-in unit under § 96.188 for any control period after the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104; and

(B) If the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104 is not December 31, the CAIR NO_X allowances allocated to the CAIR NO_X opt-in unit under § 96.188 for the control period that includes the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under

NMED Exhibit 7f

§ 96.104, multiplied by the ratio of the number of days, in the control period, starting with the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104 divided by the total number of days in the control period and rounded to the nearest whole allowance as appropriate.

(ii) The CAIR designated representative shall ensure that the compliance account of the source that includes the CAIR NO_X unit that becomes a CAIR NO_X unit under § 96.104 contains the CAIR NO_X allowances necessary for completion of the deduction under paragraph (b)(2)(i) of this section.

(3)(i) For every control period after the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104, the CAIR NO_X opt-in unit will be treated, solely for purposes of CAIR NO_X allowance allocations under § 96.142, as a unit that commences operation on the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104 and will be allocated CAIR NO_X allowances under § 96.142.

(ii) Notwithstanding paragraph (b)(3)(i) of this section, if the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104 is not January 1, the following number of CAIR NO_X allowances will be allocated to the CAIR NO_X opt-in unit (as a CAIR NO_X unit) under § 96.142 for the control period that includes the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104:

(A) The number of CAIR NO_X allowances otherwise allocated to the CAIR NO_X opt-in unit (as a CAIR NO_X unit) under § 96.142 for the control period multiplied by;

(B) The ratio of the number of days, in the control period, starting with the date on which the CAIR NO_X opt-in unit becomes a CAIR NO_X unit under § 96.104, divided by the total number of days in the control period; and

(C) Rounded to the nearest whole allowance as appropriate.

§ 96.188 NO_X allowance allocations to CAIR NO_X opt-in units.

(a) *Timing requirements.* (1) When the CAIR opt-in permit is issued under § 96.184(e), the permitting authority will allocate CAIR NO_X allowances to the CAIR NO_X opt-in unit, and submit to the Administrator the allocation for the control period in which a CAIR NO_X opt-in unit enters the CAIR NO_X Annual Trading Program under § 96.184(g), in accordance with paragraph (b) or (c) of this section.

(2) By no later than October 31 of the control period in which a CAIR opt-in unit enters the CAIR NO_X Annual Trading Program under § 96.184(g) and October 31 of each year thereafter, the permitting authority will allocate CAIR NO_X allowances to the CAIR NO_X opt-in unit, and submit to the Administrator the allocation for the control period that includes such submission deadline and in which the unit is a CAIR NO_X opt-in unit, in accordance with paragraph (b) or (c) of this section.

(b) *Calculation of allocation.* For each control period for which a CAIR NO_X opt-in unit is to be allocated CAIR NO_X allowances, the permitting authority will allocate in accordance with the following procedures:

(1) The heat input (in mmBtu) used for calculating the CAIR NO_X allowance allocation will be the lesser of:

(i) The CAIR NO_X opt-in unit's baseline heat input determined under § 96.184(c); or

(ii) The CAIR NO_X opt-in unit's heat input, as determined in accordance with subpart HH of this part, for the immediately prior control period, except when the allocation is being calculated for the control period in which the CAIR NO_X opt-in unit enters the CAIR NO_X Annual Trading Program under § 96.184(g).

(2) The NO_X emission rate (in lb/mmBtu) used for calculating CAIR NO_X allowance allocations will be the lesser of:

(i) The CAIR NO_X opt-in unit's baseline NO_X emissions rate (in lb/mmBtu) determined under § 96.184(d) and multiplied by 70 percent; or

(ii) The most stringent State or Federal NO_X emissions limitation applicable to the CAIR NO_X opt-in unit at any time during the control period for which CAIR NO_X allowances are to be allocated.

(3) The permitting authority will allocate CAIR NO_X allowances to the CAIR NO_X opt-in unit in an amount equaling the heat input under paragraph (b)(1) of this section, multiplied by the NO_X emission rate under paragraph (b)(2) of this section, divided by 2,000 lb/ton, and rounded to the nearest whole allowance as appropriate.

(c) Notwithstanding paragraph (b) of this section and if the CAIR designated representative requests, and the permitting authority issues a CAIR opt-in permit providing for, allocation to a CAIR NO_X opt-in unit of CAIR NO_X allowances under this paragraph (subject to the conditions in §§ 96.184(h) and 96.186(g)), the permitting authority will allocate to the CAIR NO_X opt-in unit as follows:

(1) For each control period in 2009 through 2014 for which the CAIR NO_X opt-in unit is to be allocated CAIR NO_X allowances,

(i) The heat input (in mmBtu) used for calculating CAIR NO_X allowance allocations will be determined as described in paragraph (b)(1) of this section.

(ii) The NO_X emission rate (in lb/mmBtu) used for calculating CAIR NO_X allowance allocations will be the lesser of:

(A) The CAIR NO_X opt-in unit's baseline NO_X emissions rate (in lb/mmBtu) determined under § 96.184(d); or

(B) The most stringent State or Federal NO_X emissions limitation applicable to the CAIR NO_X opt-in unit at any time during the control period in which the CAIR NO_X opt-in unit enters the CAIR NO_X Annual Trading Program under § 96.184(g).

(iii) The permitting authority will allocate CAIR NO_X allowances to the CAIR NO_X opt-in unit in an amount equaling the heat input under paragraph (c)(1)(i) of this section, multiplied by the NO_X emission rate under paragraph (c)(1)(ii) of this section, divided by 2,000 lb/ton, and rounded to the nearest whole allowance as appropriate.

(2) For each control period in 2015 and thereafter for which the CAIR NO_X opt-in unit is to be allocated CAIR NO_X allowances,

(i) The heat input (in mmBtu) used for calculating the CAIR NO_X allowance allocations will be determined as described in paragraph (b)(1) of this section.

(ii) The NO_X emission rate (in lb/mmBtu) used for calculating the CAIR NO_X allowance allocation will be the lesser of:

(A) 0.15 lb/mmBtu;

(B) The CAIR NO_X opt-in unit's baseline NO_X emissions rate (in lb/mmBtu) determined under § 96.184(d); or

(C) The most stringent State or Federal NO_X emissions limitation applicable to the CAIR NO_X opt-in unit at any time during the control period for which CAIR NO_X allowances are to be allocated.

(iii) The permitting authority will allocate CAIR NO_X allowances to the CAIR NO_X opt-in unit in an amount equaling the heat input under paragraph (c)(2)(i) of this section, multiplied by the NO_X emission rate under paragraph (c)(2)(ii) of this section, divided by 2,000 lb/ton, and rounded to the nearest whole allowance as appropriate.

(d) *Recordation.* (1) The Administrator will record, in the compliance account of the source that

NMED Exhibit 7f

includes the CAIR NO_X opt-in unit, the CAIR NO_X allowances allocated by the permitting authority to the CAIR NO_X opt-in unit under paragraph (a)(1) of this section.

(2) By December 1 of the control period in which a CAIR opt-in unit enters the CAIR NO_X Annual Trading Program under § 96.184(g) and December 1 of each year thereafter, the Administrator will record, in the compliance account of the source that includes the CAIR NO_X opt-in unit, the CAIR NO_X allowances allocated by the permitting authority to the CAIR NO_X opt-in unit under paragraph (a)(2) of this section.

■ 3. Part 96 is amended by adding subparts AAA through CCC, adding and reserving subparts DDD and EEE and adding subparts FFF through III to read as follows:

Subpart AAA—CAIR SO_2 Trading Program General Provisions

§ 96.201 Purpose.

This subpart and subparts BBB through III establish the model rule comprising general provisions and the designated representative, permitting, allowance, monitoring, and opt-in provisions for the State Clean Air Interstate Rule (CAIR) SO_2 Trading Program, under section 110 of the Clean Air Act and § 51.124 of this chapter, as a means of mitigating interstate transport of fine particulates and sulfur dioxide. The owner or operator of a unit or a source shall comply with the requirements of this subpart and subparts BBB through III as a matter of federal law only if the State with jurisdiction over the unit and the source incorporates by reference such subparts or otherwise adopts the requirements of such subparts in accordance with § 51.124(o)(1) or (2) of this chapter, the State submits to the Administrator one or more revisions of the State implementation plan that include such adoption, and the Administrator approves such revisions. If the State adopts the requirements of such subparts in accordance with §51.124(o)(1) or (2) of this chapter, then the State authorizes the Administrator to assist the State in implementing the CAIR SO_2 Trading Program by carrying out the functions set forth for the Administrator in such subparts.

§ 96.202 Definitions.

The terms used in this subpart and subparts BBB through III shall have the meanings set forth in this section as follows:

Account number means the identification number given by the Administrator to each CAIR SO_2 Allowance Tracking System account.

Acid Rain emissions limitation means a limitation on emissions of sulfur dioxide or nitrogen oxides under the Acid Rain Program.

Acid Rain Program means a multi-state sulfur dioxide and nitrogen oxides air pollution control and emission reduction program established by the Administrator under title IV of the CAA and parts 72 through 78 of this chapter.

Administrator means the Administrator of the United States Environmental Protection Agency or the Administrator's duly authorized representative.

Allocate or *allocation* means, with regard to CAIR SO_2 allowances issued under the Acid Rain Program, the determination by the Administrator of the amount of such CAIR SO_2 allowances to be initially credited to a CAIR SO_2 unit and, with regard to CAIR SO_2 allowances issued under § 96.288, the determination by the permitting authority of the amount of such CAIR SO_2 allowances to be initially credited to a CAIR SO_2 unit.

Allowance transfer deadline means, for a control period, midnight of March 1, if it is a business day, or, if March 1 is not a business day, midnight of the first business day thereafter immediately following the control period and is the deadline by which a CAIR SO_2 allowance transfer must be submitted for recordation in a CAIR SO_2 source's compliance account in order to be used to meet the source's CAIR SO_2 emissions limitation for such control period in accordance with §96.254.

Alternate CAIR designated representative means, for a CAIR SO_2 source and each CAIR SO_2 unit at the source, the natural person who is authorized by the owners and operators of the source and all such units at the source in accordance with subparts BBB and III of this part, to act on behalf of the CAIR designated representative in matters pertaining to the CAIR SO_2 Trading Program. If the CAIR SO_2 source is also a CAIR NO_X source, then this natural person shall be the same person as the alternate CAIR designated representative under the CAIR NO_X Annual Trading Program. If the CAIR SO_2 source is also a CAIR NO_X Ozone Season source, then this natural person shall be the same person as the alternate CAIR designated representative under the CAIR NO_X Ozone Season Trading Program. If the CAIR SO_2 source is also subject to the Acid Rain Program, then this natural person shall be the same person as the alternate designated representative under the Acid Rain Program.

Automated data acquisition and handling system or *DAHS* means that component of the continuous emission monitoring system, or other emissions monitoring system approved for use under subpart HHH of this part, designed to interpret and convert individual output signals from pollutant concentration monitors, flow monitors, diluent gas monitors, and other component parts of the monitoring system to produce a continuous record of the measured parameters in the measurement units required by subpart HHH of this part.

Boiler means an enclosed fossil- or other-fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

Bottoming-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful thermal energy and at least some of the reject heat from the useful thermal energy application or process is then used for electricity production.

CAIR authorized account representative means, with regard to a general account, a responsible natural person who is authorized, in accordance with subparts BBB and III of this part, to transfer and otherwise dispose of CAIR SO_2 allowances held in the general account and, with regard to a compliance account, the CAIR designated representative of the source.

CAIR designated representative means, for a CAIR SO_2 source and each CAIR SO_2 unit at the source, the natural person who is authorized by the owners and operators of the source and all such units at the source, in accordance with subparts BBB and III of this part, to represent and legally bind each owner and operator in matters pertaining to the CAIR SO_2 Trading Program. If the CAIR SO_2 source is also a CAIR NO_X source, then this natural person shall be the same person as the CAIR designated representative under the CAIR NO_X Annual Trading Program. If the CAIR SO_2 source is also a CAIR NO_X Ozone Season source, then this natural person shall be the same person as the CAIR designated representative under the CAIR NO_X Ozone Season Trading Program. If the CAIR SO_2 source is also subject to the Acid Rain Program, then this natural person shall be the same person as the designated representative under the Acid Rain Program.

CAIR NO_X Annual Trading Program means a multi-state nitrogen oxides air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts AA through II of this part and § 51.123 of this chapter, as a means of mitigating interstate transport of fine particulates and nitrogen oxides.

CAIR NO_X Ozone Season source means a source that includes one or more CAIR NO_X Ozone Season units.

CAIR NO_X Ozone Season Trading Program means a multi-state nitrogen oxides air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts AAAA through IIII of this part and § 51.123 of this chapter, as a means of mitigating interstate transport of ozone and nitrogen oxides.

CAIR NO_X Ozone Season unit means a unit that is subject to the CAIR NO_X Ozone Season Trading Program under § 96.304 and a CAIR NO_X Ozone Season opt-in unit under subpart IIII of this part.

CAIR NO_X source means a source that includes one or more CAIR NO_X units.

CAIR NO_X unit means a unit that is subject to the CAIR NO_X Annual Trading Program under § 96.104 and a CAIR NO_X opt-in unit under subpart II of this part.

CAIR permit means the legally binding and federally enforceable written document, or portion of such document, issued by the permitting authority under subpart CCC of this part, including any permit revisions, specifying the CAIR SO_2 Trading Program requirements applicable to a CAIR SO_2 source, to each CAIR SO_2 unit at the source, and to the owners and operators and the CAIR designated representative of the source and each such unit.

CAIR SO_2 allowance means a limited authorization issued by the Administrator under the Acid Rain Program, or by a permitting authority under § 96.288, to emit sulfur dioxide during the control period of the specified calendar year for which the authorization is allocated or of any calendar year thereafter under the CAIR SO_2 Trading Program as follows:

(1) For one CAIR SO_2 allowance allocated for a control period in a year before 2010, one ton of sulfur dioxide, except as provided in § 96.254(b);

(2) For one CAIR SO_2 allowance allocated for a control period in 2010 through 2014, 0.50 ton of sulfur dioxide, except as provided in § 96.254(b); and

(3) For one CAIR SO_2 allowance allocated for a control period in 2015 or later, 0.35 ton of sulfur dioxide, except as provided in § 96.254(b).

An authorization to emit sulfur dioxide that is not issued under the Acid Rain Program or under the provisions of a State implementation plan that is approved under § 51.124(o)(1) or (2) of this chapter shall not be a CAIR SO_2 allowance.

CAIR SO_2 allowance deduction or *deduct CAIR SO_2 allowances* means the permanent withdrawal of CAIR SO_2 allowances by the Administrator from a compliance account in order to account for a specified number of tons of total sulfur dioxide emissions from all CAIR SO_2 units at a CAIR SO_2 source for a control period, determined in accordance with subpart HHH of this part, or to account for excess emissions.

CAIR SO_2 Allowance Tracking System means the system by which the Administrator records allocations, deductions, and transfers of CAIR SO_2 allowances under the CAIR SO_2 Trading Program. This is the same system as the Allowance Tracking System under § 72.2 of this chapter by which the Administrator records allocations, deduction, and transfers of Acid Rain SO_2 allowances under the Acid Rain Program.

CAIR SO_2 Allowance Tracking System account means an account in the CAIR SO_2 Allowance Tracking System established by the Administrator for purposes of recording the allocation, holding, transferring, or deducting of CAIR SO_2 allowances. Such allowances will be allocated, held, deducted, or transferred only as whole allowances.

CAIR SO_2 allowances held or *hold CAIR SO_2 allowances* means the CAIR SO_2 allowances recorded by the Administrator, or submitted to the Administrator for recordation, in accordance with subparts FFF, GGG, and III of this part or part 73 of this chapter, in a CAIR SO_2 Allowance Tracking System account.

CAIR SO_2 emissions limitation means, for a CAIR SO_2 source, the tonnage equivalent of the CAIR SO_2 allowances available for deduction for the source under § 96.254(a) and (b) for a control period.

CAIR SO_2 source means a source that includes one or more CAIR SO_2 units.

CAIR SO_2 Trading Program means a multi-state sulfur dioxide air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts AAA through III of this part and § 51.124 of this chapter, as a means of mitigating interstate transport of fine particulates and sulfur dioxide.

NMED Exhibit 7f

CAIR SO_2 unit means a unit that is subject to the CAIR SO_2 Trading Program under § 96.204 and, except for purposes of § 96.205, a CAIR SO_2 opt-in unit under subpart III of this part.

Clean Air Act or *CAA* means the Clean Air Act, 42 U.S.C. 7401, *et seq.*

Coal means any solid fuel classified as anthracite, bituminous, subbituminous, or lignite.

Coal-derived fuel means any fuel (whether in a solid, liquid, or gaseous state) produced by the mechanical, thermal, or chemical processing of coal.

Coal-fired means combusting any amount of coal or coal-derived fuel, alone, or in combination with any amount of any other fuel.

Cogeneration unit means a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine:

(1) Having equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through the sequential use of energy; and

(2) Producing during the 12-month period starting on the date the unit first produces electricity and during any calendar year after which the unit first produces electricity—

(i) For a topping-cycle cogeneration unit,

(A) Useful thermal energy not less than 5 percent of total energy output; and

(B) Useful power that, when added to one-half of useful thermal energy produced, is not less then 42.5 percent of total energy input, if useful thermal energy produced is 15 percent or more of total energy output, or not less than 45 percent of total energy input, if useful thermal energy produced is less than 15 percent of total energy output.

(ii) For a bottoming-cycle cogeneration unit, useful power not less than 45 percent of total energy input.

Combustion turbine means:

(1) An enclosed device comprising a compressor, a combustor, and a turbine and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine; and

(2) If the enclosed device under paragraph (1) of this definition is combined cycle, any associated heat recovery steam generator and steam turbine.

Commence commercial operation means, with regard to a unit serving a generator:

(1) To have begun to produce steam, gas, or other heated medium used to generate electricity for sale or use, including test generation, except as provided in § 96.205.

(i) For a unit that is a CAIR SO_2 unit under § 96.204 on the date the unit commences commercial operation as defined in paragraph (1) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of commercial operation.

(ii) For a unit that is a CAIR SO_2 unit under § 96.204 on the date the unit commences commercial operation as defined in paragraph (1) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of commercial operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(2) Notwithstanding paragraph (1) of this definition and except as provided in § 96.205, for a unit that is not a CAIR SO_2 unit under § 96.204 on the date the unit commences commercial operation as defined in paragraph (1) of this definition and is not a unit under paragraph (3) of this definition, the unit's date for commencement of commercial operation shall be the date on which the unit becomes a CAIR SO_2 unit under § 96.204.

(i) For a unit with a date for commencement of commercial operation as defined in paragraph (2) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of commercial operation.

(ii) For a unit with a date for commencement of commercial operation as defined in paragraph (2) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of commercial operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(3) Notwithstanding paragraph (1) of this definition and except as provided in § 96.284(h) or § 96.287(b)(3), for a CAIR SO_2 opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart III of this part, the unit's date for commencement of commercial operation shall be the date on which the owner or operator is required to start monitoring and reporting the SO_2 emissions rate and the heat input of the unit under § 96.284(b)(1)(i).

(i) For a unit with a date for commencement of commercial operation as defined in paragraph (3) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of commercial operation.

(ii) For a unit with a date for commencement of commercial operation as defined in paragraph (3) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of commercial operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(4) Notwithstanding paragraphs (1) through (3) of this definition, for a unit not serving a generator producing electricity for sale, the unit's date of commencement of operation shall also be the unit's date of commencement of commercial operation.

Commence operation means:

(1) To have begun any mechanical, chemical, or electronic process, including, with regard to a unit, start-up of a unit's combustion chamber, except as provided in § 96.205.

(i) For a unit that is a CAIR SO_2 unit under § 96.204 on the date the unit commences operation as defined in paragraph (1) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of operation.

(ii) For a unit that is a CAIR SO_2 unit under § 96.204 on the date the unit commences operation as defined in paragraph (1) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(2) Notwithstanding paragraph (1) of this definition and except as provided in § 96.205, for a unit that is not a CAIR SO_2 unit under § 96.204 on the date the unit commences operation as defined in paragraph (1) of this definition and is not a unit under paragraph (3) of this definition, the unit's date for commencement of operation shall be the date on which the unit becomes a CAIR SO_2 unit under § 96.204.

(i) For a unit with a date for commencement of operation as defined in paragraph (2) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such

NMED Exhibit 7f

date shall remain the unit's date of commencement of operation.

(ii) For a unit with a date for commencement of operation as defined in paragraph (2) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of operation as defined in paragraph (1),(2), or (3) of this definition as appropriate.

(3) Notwithstanding paragraph (1) of this definition and except as provided in § 96.284(h) or § 96.287(b)(3), for a CAIR SO_2 opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart III of this part, the unit's date for commencement of operation shall be the date on which the owner or operator is required to start monitoring and reporting the SO_2 emissions rate and the heat input of the unit under § 96.284(b)(1)(i).

(i) For a unit with a date for commencement of operation as defined in paragraph (3) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of operation.

(ii) For a unit with a date for commencement of operation as defined in paragraph (3) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

Common stack means a single flue through which emissions from 2 or more units are exhausted.

Compliance account means a CAIR SO_2 Allowance Tracking System account, established by the Administrator for a CAIR SO_2 source subject to an Acid Rain emissions limitations under § 73.31(a) or (b) of this chapter or for any other CAIR SO_2 source under subpart FFF or III of this part, in which any CAIR SO_2 allowance allocations for the CAIR SO_2 units at the source are initially recorded and in which are held any CAIR SO_2 allowances available for use for a control period in order to meet the source's CAIR SO_2 emissions limitation in accordance with § 96.254.

Continuous emission monitoring system or *CEMS* means the equipment required under subpart HHH of this part to sample, analyze, measure, and provide, by means of readings recorded at least once every 15 minutes (using an automated data acquisition and handling system (DAHS)), a permanent record of sulfur dioxide emissions, stack gas volumetric flow rate, stack gas moisture content, and oxygen or carbon dioxide concentration (as applicable), in a manner consistent with part 75 of this chapter. The following systems are the principal types of continuous emission monitoring systems required under subpart HHH of this part:

(1) A flow monitoring system, consisting of a stack flow rate monitor and an automated data acquisition and handling system and providing a permanent, continuous record of stack gas volumetric flow rate, in standard cubic feet per hour (scfh);

(2) A sulfur dioxide monitoring system, consisting of a SO_2 pollutant concentration monitor and an automated data acquisition handling system and providing a permanent, continuous record of SO_2 emissions, in parts per million (ppm);

(3) A moisture monitoring system, as defined in § 75.11(b)(2) of this chapter and providing a permanent, continuous record of the stack gas moisture content, in percent H_2O;

(4) A carbon dioxide monitoring system, consisting of a CO_2 pollutant concentration monitor (or an oxygen monitor plus suitable mathematical equations from which the CO_2 concentration is derived) and an automated data acquisition and handling system and providing a permanent, continuous record of CO_2 emissions, in percent CO_2; and

(5) An oxygen monitoring system, consisting of an O_2 concentration monitor and an automated data acquisition and handling system and providing a permanent, continuous record of O_2 in percent O_2.

Control period means the period beginning January 1 of a calendar year and ending on December 31 of the same year, inclusive.

Emissions means air pollutants exhausted from a unit or source into the atmosphere, as measured, recorded, and reported to the Administrator by the CAIR designated representative and as determined by the Administrator in accordance with subpart HHH of this part.

Excess emissions means any ton, or portion of a ton, of sulfur dioxide emitted by the CAIR SO_2 units at a CAIR SO_2 source during a control period that exceeds the CAIR SO_2 emissions limitation for the source, provided that any portion of a ton of excess emissions shall be treated as one ton of excess emissions.

Fossil fuel means natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material.

Fossil-fuel-fired means, with regard to a unit, combusting any amount of fossil fuel in any calendar year.

General account means a CAIR SO_2 Allowance Tracking System account, established under subpart FFF of this part, that is not a compliance account.

Generator means a device that produces electricity.

Heat input means, with regard to a specified period of time, the product (in mmBtu/time) of the gross calorific value of the fuel (in Btu/lb) divided by 1,000,000 Btu/mmBtu and multiplied by the fuel feed rate into a combustion device (in lb of fuel/time), as measured, recorded, and reported to the Administrator by the CAIR designated representative and determined by the Administrator in accordance with subpart HHH of this part and excluding the heat derived from preheated combustion air, recirculated flue gases, or exhaust from other sources.

Heat input rate means the amount of heat input (in mmBtu) divided by unit operating time (in hr) or, with regard to a specific fuel, the amount of heat input attributed to the fuel (in mmBtu) divided by the unit operating time (in hr) during which the unit combusts the fuel.

Life-of-the-unit, firm power contractual arrangement means a unit participation power sales agreement under which a utility or industrial customer reserves, or is entitled to receive, a specified amount or percentage of nameplate capacity and associated energy generated by any specified unit and pays its proportional amount of such unit's total costs, pursuant to a contract:

(1) For the life of the unit;

(2) For a cumulative term of no less than 30 years, including contracts that permit an election for early termination; or

(3) For a period no less than 25 years or 70 percent of the economic useful life of the unit determined as of the time the unit is built, with option rights to purchase or release some portion of the nameplate capacity and associated energy generated by the unit at the end of the period.

Maximum design heat input means, starting from the initial installation of a unit, the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis as specified by the manufacturer of the unit, or, starting from the completion of any subsequent physical change in the unit resulting in a decrease in the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of

NMED Exhibit 7f

combusting on a steady state basis, such decreased maximum amount as specified by the person conducting the physical change.

Monitoring system means any monitoring system that meets the requirements of subpart HHH of this part, including a continuous emissions monitoring system, an alternative monitoring system, or an excepted monitoring system under part 75 of this chapter.

Most stringent State or Federal SO_2 emissions limitation means, with regard to a unit, the lowest SO_2 emissions limitation (in terms of lb/mmBtu) that is applicable to the unit under State or Federal law, regardless of the averaging period to which the emissions limitation applies.

Nameplate capacity means, starting from the initial installation of a generator, the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other deratings) as specified by the manufacturer of the generator or, starting from the completion of any subsequent physical change in the generator resulting in an increase in the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other deratings), such increased maximum amount as specified by the person conducting the physical change.

Operator means any person who operates, controls, or supervises a CAIR SO_2 unit or a CAIR SO_2 source and shall include, but not be limited to, any holding company, utility system, or plant manager of such a unit or source.

Owner means any of the following persons:

(1) With regard to a CAIR SO_2 source or a CAIR SO_2 unit at a source, respectively:

(i) Any holder of any portion of the legal or equitable title in a CAIR SO_2 unit at the source or the CAIR SO_2 unit;

(ii) Any holder of a leasehold interest in a CAIR SO_2 unit at the source or the CAIR SO_2 unit; or

(iii) Any purchaser of power from a CAIR SO_2 unit at the source or the CAIR SO_2 unit under a life-of-the-unit, firm power contractual arrangement; provided that, unless expressly provided for in a leasehold agreement, owner shall not include a passive lessor, or a person who has an equitable interest through such lessor, whose rental payments are not based (either directly or indirectly) on the revenues or income from such CAIR SO_2 unit; or

(2) With regard to any general account, any person who has an ownership interest with respect to the CAIR SO_2 allowances held in the general account and who is subject to the binding agreement for the CAIR authorized account representative to represent the person's ownership interest with respect to CAIR SO_2 allowances.

Permitting authority means the State air pollution control agency, local agency, other State agency, or other agency authorized by the Administrator to issue or revise permits to meet the requirements of the CAIR SO_2 Trading Program in accordance with subpart CCC of this part or, if no such agency has been so authorized, the Administrator.

Potential electrical output capacity means 33 percent of a unit's maximum design heat input, divided by 3,413 Btu/kWh, divided by 1,000 kWh/MWh, and multiplied by 8,760 hr/yr.

Receive or receipt of means, when referring to the permitting authority or the Administrator, to come into possession of a document, information, or correspondence (whether sent in hard copy or by authorized electronic transmission), as indicated in an official correspondence log, or by a notation made on the document, information, or correspondence, by the permitting authority or the Administrator in the regular course of business.

Recordation, record, or *recorded* means, with regard to CAIR SO_2 allowances, the movement of CAIR SO_2 allowances by the Administrator into or between CAIR SO_2 Allowance Tracking System accounts, for purposes of allocation, transfer, or deduction.

Reference method means any direct test method of sampling and analyzing for an air pollutant as specified in § 75.22 of this chapter.

Repowered means, with regard to a unit, replacement of a coal-fired boiler with one of the following coal-fired technologies at the same source as the coal-fired boiler:

(1) Atmospheric or pressurized fluidized bed combustion;

(2) Integrated gasification combined cycle;

(3) Magnetohydrodynamics;

(4) Direct and indirect coal-fired turbines;

(5) Integrated gasification fuel cells; or

(6) As determined by the Administrator in consultation with the Secretary of Energy, a derivative of one or more of the technologies under paragraphs (1) through (5) of this definition and any other coal-fired technology capable of controlling multiple combustion emissions simultaneously with improved boiler or generation efficiency and with significantly greater waste reduction relative to the performance of technology in widespread commercial use as of January 1, 2005.

Serial number means, for a CAIR SO_2 allowance, the unique identification number assigned to each CAIR SO_2 allowance by the Administrator.

Sequential use of energy means:

(1) For a topping-cycle cogeneration unit, the use of reject heat from electricity production in a useful thermal energy application or process; or

(2) For a bottoming-cycle cogeneration unit, the use of reject heat from useful thermal energy application or process in electricity production.

Source means all buildings, structures, or installations located in one or more contiguous or adjacent properties under common control of the same person or persons. For purposes of section 502(c) of the Clean Air Act, a "source," including a "source" with multiple units, shall be considered a single "facility."

State means one of the States or the District of Columbia that adopts the CAIR SO_2 Trading Program pursuant to § 51.124 (o)(1) or (2) of this chapter.

Submit or serve means to send or transmit a document, information, or correspondence to the person specified in accordance with the applicable regulation:

(1) In person;

(2) By United States Postal Service; or

(3) By other means of dispatch or transmission and delivery. Compliance with any "submission" or "service" deadline shall be determined by the date of dispatch, transmission, or mailing and not the date of receipt.

Title V operating permit means a permit issued under title V of the Clean Air Act and part 70 or part 71 of this chapter.

Title V operating permit regulations means the regulations that the Administrator has approved or issued as meeting the requirements of title V of the Clean Air Act and part 70 or 71 of this chapter.

Ton means 2,000 pounds. For the purpose of determining compliance with the CAIR SO_2 emissions limitation, total tons of sulfur dioxide emissions for a control period shall be calculated as the sum of all recorded hourly emissions (or the mass equivalent of the recorded hourly emission rates) in accordance with subpart HHH of this part, but with any remaining fraction of a ton equal to or greater than 0.50 tons deemed to equal one ton and any remaining fraction of a ton less than 0.50 tons deemed to equal zero tons.

Topping-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful power, including electricity, and at least some of the reject heat from the electricity production is then used to provide useful thermal energy.

Total energy input means, with regard to a cogeneration unit, total energy of all forms supplied to the cogeneration unit, excluding energy produced by the cogeneration unit itself.

Total energy output means, with regard to a cogeneration unit, the sum of useful power and useful thermal energy produced by the cogeneration unit.

Unit means a stationary, fossil-fuel-fired boiler or combustion turbine or other stationary, fossil-fuel-fired combustion device.

Unit operating day means a calendar day in which a unit combusts any fuel.

Unit operating hour or *hour of unit operation* means an hour in which a unit combusts any fuel.

Useful power means, with regard to a cogeneration unit, electricity or mechanical energy made available for use, excluding any such energy used in the power production process (which process includes, but is not limited to, any on-site processing or treatment of fuel combusted at the unit and any on-site emission controls).

Useful thermal energy means, with regard to a cogeneration unit, thermal energy that is:

(1) Made available to an industrial or commercial process (not a power production process), excluding any heat contained in condensate return or makeup water;

(2) Used in a heat application (*e.g.*, space heating or domestic hot water heating); or

(3) Used in a space cooling application (*i.e.*, thermal energy used by an absorption chiller).

Utility power distribution system means the portion of an electricity grid owned or operated by a utility and dedicated to delivering electricity to customers.

§ 96.203 Measurements, abbreviations, and acronyms.

Measurements, abbreviations, and acronyms used in this part are defined as follows:

Btu-British thermal unit.
CO_2—carbon dioxide.
NO_X—nitrogen oxides.
hr—hour.
kW—kilowatt electrical.
kWh—kilowatt hour.
mmBtu—million Btu.
MWe—megawatt electrical.
MWh—megawatt hour.
O_2—oxygen.
ppm—parts per million.
lb—pound.
scfh—standard cubic feet per hour.
SO_2—sulfur dioxide.
H_2O—water.
yr—year.

§ 96.204 Applicability.

The following units in a State shall be CAIR SO_2 units, and any source that includes one or more such units shall be a CAIR SO_2 source, subject to the requirements of this subpart and subparts BBB through HHH of this part:

(a) Except as provided in paragraph (b) of this section, a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine serving at any time, since the start-up of the unit's combustion chamber, a generator with nameplate capacity of more than 25 MWe producing electricity for sale.

(b) For a unit that qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity and continues to qualify as a cogeneration unit, a cogeneration unit serving at any time a generator with nameplate capacity of more than 25 MWe and supplying in any calendar year more than one-third of the unit's potential electric output capacity or 219,000 MWh, whichever is greater, to any utility power distribution system for sale. If a unit qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity but subsequently no longer qualifies as a cogeneration unit, the unit shall be subject to paragraph (a) of this section starting on the day on which the unit first no longer qualifies as a cogeneration unit.

§ 96.205 Retired unit exemption.

(a)(1) Any CAIR SO_2 unit that is permanently retired and is not a CAIR SO_2 opt-in unit under subpart III of this part shall be exempt from the CAIR SO_2 Trading Program, except for the provisions of this section, § 96.202, § 96.203, § 96.204, § 96.206(c)(4) through (8), § 96.207, and subparts FFF and GGG of this part.

(2) The exemption under paragraph (a)(1) of this section shall become effective the day on which the CAIR SO_2 unit is permanently retired. Within 30 days of the unit's permanent retirement, the CAIR designated representative shall submit a statement to the permitting authority otherwise responsible for administering any CAIR permit for the unit and shall submit a copy of the statement to the Administrator. The statement shall state, in a format prescribed by the permitting authority, that the unit was permanently retired on a specific date and will comply with the requirements of paragraph (b) of this section.

(3) After receipt of the statement under paragraph (a)(2) of this section, the permitting authority will amend any permit under subpart CCC of this part covering the source at which the unit is located to add the provisions and requirements of the exemption under paragraphs (a)(1) and (b) of this section.

(b) *Special provisions.* (1) A unit exempt under paragraph (a) of this section shall not emit any sulfur dioxide, starting on the date that the exemption takes effect.

(2) For a period of 5 years from the date the records are created, the owners and operators of a unit exempt under paragraph (a) of this section shall retain at the source that includes the unit, records demonstrating that the unit is permanently retired. The 5-year period for keeping records may be extended for cause, at any time before the end of the period, in writing by the permitting authority or the Administrator. The owners and operators bear the burden of proof that the unit is permanently retired.

(3) The owners and operators and, to the extent applicable, the CAIR designated representative of a unit exempt under paragraph (a) of this section shall comply with the requirements of the CAIR SO_2 Trading Program concerning all periods for which the exemption is not in effect, even if such requirements arise, or must be complied with, after the exemption takes effect.

(4) A unit exempt under paragraph (a) of this section and located at a source that is required, or but for this exemption would be required, to have a title V operating permit shall not resume operation unless the CAIR designated representative of the source submits a complete CAIR permit application under § 96.222 for the unit not less than 18 months (or such lesser time provided by the permitting authority) before the later of January 1, 2010 or the date on which the unit resumes operation.

(5) On the earlier of the following dates, a unit exempt under paragraph (a) of this section shall lose its exemption:

(i) The date on which the CAIR designated representative submits a CAIR permit application for the unit under paragraph (b)(4) of this section;

(ii) The date on which the CAIR designated representative is required under paragraph (b)(4) of this section to submit a CAIR permit application for the unit; or

NMED Exhibit 7f

(iii) The date on which the unit resumes operation, if the CAIR designated representative is not required to submit a CAIR permit application for the unit.

(6) For the purpose of applying monitoring, reporting, and recordkeeping requirements under subpart HHH of this part, a unit that loses its exemption under paragraph (a) of this section shall be treated as a unit that commences operation and commercial operation on the first date on which the unit resumes operation.

§ 96.206 Standard requirements.

(a) *Permit requirements.* (1) The CAIR designated representative of each CAIR SO_2 source required to have a title V operating permit and each CAIR SO_2 unit required to have a title V operating permit at the source shall:

(i) Submit to the permitting authority a complete CAIR permit application under § 96.222 in accordance with the deadlines specified in § 96.221(a) and (b); and

(ii) Submit in a timely manner any supplemental information that the permitting authority determines is necessary in order to review a CAIR permit application and issue or deny a CAIR permit.

(2) The owners and operators of each CAIR SO_2 source required to have a title V operating permit and each CAIR SO_2 unit required to have a title V operating permit at the source shall have a CAIR permit issued by the permitting authority under subpart CCC of this part for the source and operate the source and the unit in compliance with such CAIR permit.

(3) Except as provided in subpart III of this part, the owners and operators of a CAIR SO_2 source that is not otherwise required to have a title V operating permit and each CAIR SO_2 unit that is not otherwise required to have a title V operating permit are not required to submit a CAIR permit application, and to have a CAIR permit, under subpart CCC of this part for such CAIR SO_2 source and such CAIR SO_2 unit.

(b) *Monitoring, reporting, and recordkeeping requirements.* (1) The owners and operators, and the CAIR designated representative, of each CAIR SO_2 source and each CAIR SO_2 unit at the source shall comply with the monitoring, reporting, and recordkeeping requirements of subpart HHH of this part.

(2) The emissions measurements recorded and reported in accordance with subpart HHH of this part shall be used to determine compliance by each CAIR SO_2 source with the CAIR SO_2 emissions limitation under paragraph (c) of this section.

(c) *Sulfur dioxide emission requirements.* (1) As of the allowance transfer deadline for a control period, the owners and operators of each CAIR SO_2 source and each CAIR SO_2 unit at the source shall hold, in the source's compliance account, a tonnage equivalent in CAIR SO_2 allowances available for compliance deductions for the control period, as determined in accordance with § 96.254(a) and (b), not less than the tons of total sulfur dioxide emissions for the control period from all CAIR SO_2 units at the source, as determined in accordance with subpart HHH of this part.

(2) A CAIR SO_2 unit shall be subject to the requirements under paragraph (c)(1) of this section starting on the later of January 1, 2010 or the deadline for meeting the unit's monitor certification requirements under § 96.270(b)(1),(2), or (5).

(3) A CAIR SO_2 allowance shall not be deducted, for compliance with the requirements under paragraph (c)(1) of this section, for a control period in a calendar year before the year for which the CAIR SO_2 allowance was allocated.

(4) CAIR SO_2 allowances shall be held in, deducted from, or transferred into or among CAIR SO_2 Allowance Tracking System accounts in accordance with subparts FFF and GGG of this part.

(5) A CAIR SO_2 allowance is a limited authorization to emit sulfur dioxide in accordance with the CAIR SO_2 Trading Program. No provision of the CAIR SO_2 Trading Program, the CAIR permit application, the CAIR permit, or an exemption under § 96.205 and no provision of law shall be construed to limit the authority of the State or the United States to terminate or limit such authorization.

(6) A CAIR SO_2 allowance does not constitute a property right.

(7) Upon recordation by the Administrator under subpart FFF, GGG, or III of this part, every allocation, transfer, or deduction of a CAIR SO_2 allowance to or from a CAIR SO_2 unit's compliance account is incorporated automatically in any CAIR permit of the source that includes the CAIR SO_2 unit.

(d) *Excess emissions requirements*—(1) If a CAIR SO_2 source emits sulfur dioxide during any control period in excess of the CAIR SO_2 emissions limitation, then:

(i) The owners and operators of the source and each CAIR SO_2 unit at the source shall surrender the CAIR SO_2 allowances required for deduction under § 96.254(d)(1) and pay any fine, penalty, or assessment or comply with any other remedy imposed, for the same violations, under the Clean Air Act or applicable State law; and

(ii) Each ton of such excess emissions and each day of such control period shall constitute a separate violation of this subpart, the Clean Air Act, and applicable State law.

(2) [Reserved]

(e) *Recordkeeping and reporting requirements.* (1) Unless otherwise provided, the owners and operators of the CAIR SO_2 source and each CAIR SO_2 unit at the source shall keep on site at the source each of the following documents for a period of 5 years from the date the document is created. This period may be extended for cause, at any time before the end of 5 years, in writing by the permitting authority or the Administrator.

(i) The certificate of representation under § 96.213 for the CAIR designated representative for the source and each CAIR SO_2 unit at the source and all documents that demonstrate the truth of the statements in the certificate of representation; provided that the certificate and documents shall be retained on site at the source beyond such 5-year period until such documents are superseded because of the submission of a new certificate of representation under § 96.213 changing the CAIR designated representative.

(ii) All emissions monitoring information, in accordance with subpart HHH of this part, provided that to the extent that subpart HHH of this part provides for a 3-year period for recordkeeping, the 3-year period shall apply.

(iii) Copies of all reports, compliance certifications, and other submissions and all records made or required under the CAIR SO_2 Trading Program.

(iv) Copies of all documents used to complete a CAIR permit application and any other submission under the CAIR SO_2 Trading Program or to demonstrate compliance with the requirements of the CAIR SO_2 Trading Program.

(2) The CAIR designated representative of a CAIR SO_2 source and each CAIR SO_2 unit at the source shall submit the reports required under the CAIR SO_2 Trading Program, including those under subpart HHH of this part.

(f) *Liability.* (1) Each CAIR SO_2 source and each CAIR SO_2 unit shall meet the requirements of the CAIR SO_2 Trading Program.

(2) Any provision of the CAIR SO_2 Trading Program that applies to a CAIR SO_2 source or the CAIR designated representative of a CAIR SO_2 source shall also apply to the owners and operators of such source and of the CAIR SO_2 units at the source.

NMED Exhibit 7f

(3) Any provision of the CAIR SO_2 Trading Program that applies to a CAIR SO_2 unit or the CAIR designated representative of a CAIR SO_2 unit shall also apply to the owners and operators of such unit.

(g) *Effect on other authorities.* No provision of the CAIR SO_2 Trading Program, a CAIR permit application, a CAIR permit, or an exemption under § 96.205 shall be construed as exempting or excluding the owners and operators, and the CAIR designated representative, of a CAIR SO_2 source or CAIR SO_2 unit from compliance with any other provision of the applicable, approved State implementation plan, a federally enforceable permit, or the Clean Air Act.

§ 96.207 Computation of time.

(a) Unless otherwise stated, any time period scheduled, under the CAIR SO_2 Trading Program, to begin on the occurrence of an act or event shall begin on the day the act or event occurs.

(b) Unless otherwise stated, any time period scheduled, under the CAIR SO_2 Trading Program, to begin before the occurrence of an act or event shall be computed so that the period ends the day before the act or event occurs.

(c) Unless otherwise stated, if the final day of any time period, under the CAIR SO_2 Trading Program, falls on a weekend or a State or Federal holiday, the time period shall be extended to the next business day.

§ 96.208 Appeal procedures.

The appeal procedures for decisions of the Administrator under the CAIR SO_2 Trading Program are set forth in part 78 of this chapter.

Subpart BBB—CAIR Designated Representative for CAIR SO_2 Sources

§ 96.210 Authorization and responsibilities of CAIR designated representative.

(a) Except as provided under § 96.211, each CAIR SO_2 source, including all CAIR SO_2 units at the source, shall have one and only one CAIR designated representative, with regard to all matters under the CAIR SO_2 Trading Program concerning the source or any CAIR SO_2 unit at the source.

(b) The CAIR designated representative of the CAIR SO_2 source shall be selected by an agreement binding on the owners and operators of the source and all CAIR SO_2 units at the source and shall act in accordance with the certification statement in § 96.213(a)(4)(iv).

(c) Upon receipt by the Administrator of a complete certificate of representation under § 96.213, the CAIR designated representative of the source shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each owner and operator of the CAIR SO_2 source represented and each CAIR SO_2 unit at the source in all matters pertaining to the CAIR SO_2 Trading Program, notwithstanding any agreement between the CAIR designated representative and such owners and operators. The owners and operators shall be bound by any decision or order issued to the CAIR designated representative by the permitting authority, the Administrator, or a court regarding the source or unit.

(d) No CAIR permit will be issued, no emissions data reports will be accepted, and no CAIR SO_2 Allowance Tracking System account will be established for a CAIR SO_2 unit at a source, until the Administrator has received a complete certificate of representation under § 96.213 for a CAIR designated representative of the source and the CAIR SO_2 units at the source.

(e)(1) Each submission under the CAIR SO_2 Trading Program shall be submitted, signed, and certified by the CAIR designated representative for each CAIR SO_2 source on behalf of which the submission is made. Each such submission shall include the following certification statement by the CAIR designated representative: ''I am authorized to make this submission on behalf of the owners and operators of the source or units for which the submission is made. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment.''

(2) The permitting authority and the Administrator will accept or act on a submission made on behalf of owner or operators of a CAIR SO_2 source or a CAIR SO_2 unit only if the submission has been made, signed, and certified in accordance with paragraph (e)(1) of this section.

§ 96.211 Alternate CAIR designated representative.

(a) A certificate of representation under § 96.213 may designate one and only one alternate CAIR designated representative, who may act on behalf of the CAIR designated representative. The agreement by which the alternate CAIR designated representative is selected shall include a procedure for authorizing the alternate CAIR designated representative to act in lieu of the CAIR designated representative.

(b) Upon receipt by the Administrator of a complete certificate of representation under § 96.213, any representation, action, inaction, or submission by the alternate CAIR designated representative shall be deemed to be a representation, action, inaction, or submission by the CAIR designated representative.

(c) Except in this section and §§ 96.202, 96.210(a) and (d), 96.212, 96.213, 96.251, and 96.282, whenever the term ''CAIR designated representative'' is used in subparts AAA through III of this part, the term shall be construed to include the CAIR designated representative or any alternate CAIR designated representative.

§ 96.212 Changing CAIR designated representative and alternate CAIR designated representative; changes in owners and operators.

(a) *Changing CAIR designated representative.* The CAIR designated representative may be changed at any time upon receipt by the Administrator of a superseding complete certificate of representation under § 96.213. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CAIR designated representative before the time and date when the Administrator receives the superseding certificate of representation shall be binding on the new CAIR designated representative and the owners and operators of the CAIR SO_2 source and the CAIR SO_2 units at the source.

(b) *Changing alternate CAIR designated representative.* The alternate CAIR designated representative may be changed at any time upon receipt by the Administrator of a superseding complete certificate of representation under § 96.213. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous alternate CAIR designated representative before the time and date when the Administrator receives the superseding certificate of representation shall be binding on the new alternate CAIR designated representative and the owners and operators of the CAIR SO_2 source and the CAIR SO_2 units at the source.

(c) Changes in owners and operators. (1) In the event a new owner or operator of a CAIR SO_2 source or a CAIR SO_2 unit

is not included in the list of owners and operators in the certificate of representation under § 96.213, such new owner or operator shall be deemed to be subject to and bound by the certificate of representation, the representations, actions, inactions, and submissions of the CAIR designated representative and any alternate CAIR designated representative of the source or unit, and the decisions and orders of the permitting authority, the Administrator, or a court, as if the new owner or operator were included in such list.

(2) Within 30 days following any change in the owners and operators of a CAIR SO_2 source or a CAIR SO_2 unit, including the addition of a new owner or operator, the CAIR designated representative or any alternate CAIR designated representative shall submit a revision to the certificate of representation under § 96.213 amending the list of owners and operators to include the change.

§ 96.213 Certificate of representation.

(a) A complete certificate of representation for a CAIR designated representative or an alternate CAIR designated representative shall include the following elements in a format prescribed by the Administrator:

(1) Identification of the CAIR SO_2 source, and each CAIR SO_2 unit at the source, for which the certificate of representation is submitted.

(2) The name, address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the CAIR designated representative and any alternate CAIR designated representative.

(3) A list of the owners and operators of the CAIR SO_2 source and of each CAIR SO_2 unit at the source.

(4) The following certification statements by the CAIR designated representative and any alternate CAIR designated representative—

(i) ''I certify that I was selected as the CAIR designated representative or alternate CAIR designated representative, as applicable, by an agreement binding on the owners and operators of the source and each CAIR SO_2 unit at the source.''

(ii) ''I certify that I have all the necessary authority to carry out my duties and responsibilities under the CAIR SO_2 Trading Program on behalf of the owners and operators of the source and of each CAIR SO_2 unit at the source and that each such owner and operator shall be fully bound by my representations, actions, inactions, or submissions.''

(iii) ''I certify that the owners and operators of the source and of each CAIR SO_2 unit at the source shall be bound by any order issued to me by the Administrator, the permitting authority, or a court regarding the source or unit.''

(iv) ''Where there are multiple holders of a legal or equitable title to, or a leasehold interest in, a CAIR SO_2 unit, or where a customer purchases power from a CAIR SO_2 unit under a life-of- the-unit, firm power contractual arrangement, I certify that: I have given a written notice of my selection as the 'CAIR designated representative' or 'alternate CAIR designated representative', as applicable, and of the agreement by which I was selected to each owner and operator of the source and of each CAIR SO_2 unit at the source; and CAIR SO_2 allowances and proceeds of transactions involving CAIR SO_2 allowances will be deemed to be held or distributed in proportion to each holder's legal, equitable, leasehold, or contractual reservation or entitlement, except that, if such multiple holders have expressly provided for a different distribution of CAIR SO_2 allowances by contract, CAIR SO_2 allowances and proceeds of transactions involving CAIR SO_2 allowances will be deemed to be held or distributed in accordance with the contract.''

(5) The signature of the CAIR designated representative and any alternate CAIR designated representative and the dates signed.

(b) Unless otherwise required by the permitting authority or the Administrator, documents of agreement referred to in the certificate of representation shall not be submitted to the permitting authority or the Administrator. Neither the permitting authority nor the Administrator shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

§ 96.214 Objections concerning CAIR designated representative.

(a) Once a complete certificate of representation under § 96.213 has been submitted and received, the permitting authority and the Administrator will rely on the certificate of representation unless and until a superseding complete certificate of representation under § 96.213 is received by the Administrator.

(b) Except as provided in § 96.212(a) or (b), no objection or other communication submitted to the permitting authority or the Administrator concerning the authorization, or any representation, action, inaction, or submission, of the CAIR designated representative shall affect any representation, action, inaction, or submission of the CAIR designated representative or the finality of any decision or order by the permitting authority or the Administrator under the CAIR SO_2 Trading Program.

(c) Neither the permitting authority nor the Administrator will adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of any CAIR designated representative, including private legal disputes concerning the proceeds of CAIR SO_2 allowance transfers.

Subpart CCC—Permits

§ 96.220 General CAIR SO_2 Trading Program permit requirements.

(a) For each CAIR SO_2 source required to have a title V operating permit or required, under subpart III of this part, to have a title V operating permit or other federally enforceable permit, such permit shall include a CAIR permit administered by the permitting authority for the title V operating permit or the federally enforceable permit as applicable. The CAIR portion of the title V permit or other federally enforceable permit as applicable shall be administered in accordance with the permitting authority's title V operating permits regulations promulgated under part 70 or 71 of this chapter or the permitting authority's regulations for other federally enforceable permits as applicable, except as provided otherwise by this subpart and subpart III of this part.

(b) Each CAIR permit shall contain, with regard to the CAIR SO_2 source and the CAIR SO_2 units at the source, all applicable CAIR SO_2 Trading Program, CAIR NO_X Annual Trading Program, and CAIR NO_X Ozone Season Trading Program requirements and shall be a complete and separable portion of the title V operating permit or other federally enforceable permit under paragraph (a) of this section.

§ 96.221 Submission of CAIR permit applications.

(a) *Duty to apply.* The CAIR designated representative of any CAIR SO_2 source required to have a title V operating permit shall submit to the permitting authority a complete CAIR permit application under § 96.222 for the source covering each CAIR SO_2 unit at the source at least 18 months (or such lesser time provided by the permitting authority) before the later of January 1, 2010 or the date on which the CAIR SO_2 unit commences operation.

(b) *Duty to Reapply.* For a CAIR SO_2 source required to have a title V operating permit, the CAIR designated

NMED Exhibit 7f

representative shall submit a complete CAIR permit application under § 96.222 for the source covering each CAIR SO_2 unit at the source to renew the CAIR permit in accordance with the permitting authority's title V operating permits regulations addressing permit renewal.

§ 96.222 Information requirements for CAIR permit applications.

A complete CAIR permit application shall include the following elements concerning the CAIR SO_2 source for which the application is submitted, in a format prescribed by the permitting authority:

(a) Identification of the CAIR SO_2 source;

(b) Identification of each CAIR SO_2 unit at the CAIR SO_2 source; and

(c) The standard requirements under § 96.206.

§ 96.223 CAIR permit contents and term.

(a) Each CAIR permit will contain, in a format prescribed by the permitting authority, all elements required for a complete CAIR permit application under § 96.222.

(b) Each CAIR permit is deemed to incorporate automatically the definitions of terms under § 96.202 and, upon recordation by the Administrator under subpart FFF, GGG, or III of this part, every allocation, transfer, or deduction of a CAIR SO_2 allowance to or from the compliance account of the CAIR SO_2 source covered by the permit.

(c) The term of the CAIR permit will be set by the permitting authority, as necessary to facilitate coordination of the renewal of the CAIR permit with issuance, revision, or renewal of the CAIR SO_2 source's title V operating permit or other federally enforceable permit as applicable.

§ 96.224 CAIR permit revisions.

Except as provided in § 96.223(b), the permitting authority will revise the CAIR permit, as necessary, in accordance with the permitting authority's title V operating permits regulations or the permitting authority's regulations for other federally enforceable permits as applicable addressing permit revisions.

Subpart DDD—[Reserved]

Subpart EEE—[Reserved]

Subpart FFF—CAIR SO_2 Allowance Tracking System

§ 96.250 [Reserved]

§ 96.251 Establishment of accounts.

(a) *Compliance accounts.* Except as provided in § 96.284(e), upon receipt of a complete certificate of representation under § 96.213, the Administrator will establish a compliance account for the CAIR SO_2 source for which the certificate of representation was submitted, unless the source already has a compliance account.

(b) *General accounts*—(1) *Application for general account.*

(i) Any person may apply to open a general account for the purpose of holding and transferring CAIR SO_2 allowances. An application for a general account may designate one and only one CAIR authorized account representative and one and only one alternate CAIR authorized account representative who may act on behalf of the CAIR authorized account representative. The agreement by which the alternate CAIR authorized account representative is selected shall include a procedure for authorizing the alternate CAIR authorized account representative to act in lieu of the CAIR authorized account representative.

(ii) A complete application for a general account shall be submitted to the Administrator and shall include the following elements in a format prescribed by the Administrator:

(A) Name, mailing address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the CAIR authorized account representative and any alternate CAIR authorized account representative;

(B) Organization name and type of organization, if applicable;

(C) A list of all persons subject to a binding agreement for the CAIR authorized account representative and any alternate CAIR authorized account representative to represent their ownership interest with respect to the CAIR SO_2 allowances held in the general account;

(D) The following certification statement by the CAIR authorized account representative and any alternate CAIR authorized account representative: ''I certify that I was selected as the CAIR authorized account representative or the alternate CAIR authorized account representative, as applicable, by an agreement that is binding on all persons who have an ownership interest with respect to CAIR SO_2 allowances held in the general account. I certify that I have all the necessary authority to carry out my duties and responsibilities under the CAIR SO_2 Trading Program on behalf of such persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the Administrator or a court regarding the general account.''

(E) The signature of the CAIR authorized account representative and any alternate CAIR authorized account representative and the dates signed.

(iii) Unless otherwise required by the permitting authority or the Administrator, documents of agreement referred to in the application for a general account shall not be submitted to the permitting authority or the Administrator. Neither the permitting authority nor the Administrator shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

(2) Authorization of CAIR authorized account representative.

(i) Upon receipt by the Administrator of a complete application for a general account under paragraph (b)(1) of this section:

(A) The Administrator will establish a general account for the person or persons for whom the application is submitted.

(B) The CAIR authorized account representative and any alternate CAIR authorized account representative for the general account shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each person who has an ownership interest with respect to CAIR SO_2 allowances held in the general account in all matters pertaining to the CAIR SO_2 Trading Program, notwithstanding any agreement between the CAIR authorized account representative or any alternate CAIR authorized account representative and such person. Any such person shall be bound by any order or decision issued to the CAIR authorized account representative or any alternate CAIR authorized account representative by the Administrator or a court regarding the general account.

(C) Any representation, action, inaction, or submission by any alternate CAIR authorized account representative shall be deemed to be a representation, action, inaction, or submission by the CAIR authorized account representative.

(ii) Each submission concerning the general account shall be submitted, signed, and certified by the CAIR authorized account representative or any alternate CAIR authorized account representative for the persons having an ownership interest with respect to CAIR SO_2 allowances held in the general account. Each such submission shall include the following certification statement by the CAIR authorized account representative or any alternate CAIR authorized account representative: ''I am authorized to make this submission on behalf of the persons having an ownership interest with respect to the CAIR SO_2 allowances held

NMED Exhibit 7f

in the general account. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment.''

(iii) The Administrator will accept or act on a submission concerning the general account only if the submission has been made, signed, and certified in accordance with paragraph (b)(2)(ii) of this section.

(3) Changing CAIR authorized account representative and alternate CAIR authorized account representative; changes in persons with ownership interest.

(i) The CAIR authorized account representative for a general account may be changed at any time upon receipt by the Administrator of a superseding complete application for a general account under paragraph (b)(1) of this section. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CAIR authorized account representative before the time and date when the Administrator receives the superseding application for a general account shall be binding on the new CAIR authorized account representative and the persons with an ownership interest with respect to the CAIR SO_2 allowances in the general account.

(ii) The alternate CAIR authorized account representative for a general account may be changed at any time upon receipt by the Administrator of a superseding complete application for a general account under paragraph (b)(1) of this section. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous alternate CAIR authorized account representative before the time and date when the Administrator receives the superseding application for a general account shall be binding on the new alternate CAIR authorized account representative and the persons with an ownership interest with respect to the CAIR SO_2 allowances in the general account.

(iii)(A) In the event a new person having an ownership interest with respect to CAIR SO_2 allowances in the general account is not included in the list of such persons in the application for a general account, such new person shall be deemed to be subject to and bound by the application for a general account, the representation, actions, inactions, and submissions of the CAIR authorized account representative and any alternate CAIR authorized account representative of the account, and the decisions and orders of the Administrator or a court, as if the new person were included in such list.

(B) Within 30 days following any change in the persons having an ownership interest with respect to CAIR SO_2 allowances in the general account, including the addition of persons, the CAIR authorized account representative or any alternate CAIR authorized account representative shall submit a revision to the application for a general account amending the list of persons having an ownership interest with respect to the CAIR SO_2 allowances in the general account to include the change.

(4) Objections concerning CAIR authorized account representative.

(i) Once a complete application for a general account under paragraph (b)(1) of this section has been submitted and received, the Administrator will rely on the application unless and until a superseding complete application for a general account under paragraph (b)(1) of this section is received by the Administrator.

(ii) Except as provided in paragraph (b)(3)(i) or (ii) of this section, no objection or other communication submitted to the Administrator concerning the authorization, or any representation, action, inaction, or submission of the CAIR authorized account representative or any alternative CAIR authorized account representative for a general account shall affect any representation, action, inaction, or submission of the CAIR authorized account representative or any alternative CAIR authorized account representative or the finality of any decision or order by the Administrator under the CAIR SO_2 Trading Program.

(iii) The Administrator will not adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of the CAIR authorized account representative or any alternative CAIR authorized account representative for a general account, including private legal disputes concerning the proceeds of CAIR SO_2 allowance transfers.

(c) *Account identification.* The Administrator will assign a unique identifying number to each account established under paragraph (a) or (b) of this section.

§ 96.252 Responsibilities of CAIR authorized account representative.

Following the establishment of a CAIR SO_2 Allowance Tracking System account, all submissions to the Administrator pertaining to the account, including, but not limited to, submissions concerning the deduction or transfer of CAIR SO_2 allowances in the account, shall be made only by the CAIR authorized account representative for the account.

§ 96.253 Recordation of CAIR SO_2 allowances.

(a)(1) After a compliance account is established under § 96.251(a) or § 73.31(a) or (b) of this chapter, the Administrator will record in the compliance account any CAIR SO_2 allowance allocated to any CAIR SO_2 unit at the source for each of the 30 years starting the later of 2010 or the year in which the compliance account is established and any CAIR SO_2 allowance allocated for each of the 30 years starting the later of 2010 or the year in which the compliance account is established and transferred to the source in accordance with subpart GGG of this part or subpart D of part 73 of this chapter.

(2) In 2011 and each year thereafter, after Administrator has completed all deductions under § 96.254(b), the Administrator will record in the compliance account any CAIR SO_2 allowance allocated to any CAIR SO_2 unit at the source for the new 30th year (*i.e.*, the year that is 30 years after the calendar year for which such deductions are or could be made) and any CAIR SO_2 allowance allocated for the new 30th year and transferred to the source in accordance with subpart GGG of this part or subpart D of part 73 of this chapter.

(b)(1) After a general account is established under § 96.251(b) or § 73.31(c) of this chapter, the Administrator will record in the general account any CAIR SO_2 allowance allocated for each of the 30 years starting the later of 2010 or the year in which the general account is established and transferred to the general account in accordance with subpart GGG of this part or subpart D of part 73 of this chapter.

(2) In 2011 and each year thereafter, after Administrator has completed all deductions under § 96.254(b), the Administrator will record in the general account any CAIR SO_2 allowance allocated for the new 30th year (*i.e.*, the year that is 30 years after the calendar

NMED Exhibit 7f

year for which such deductions are or could be made) and transferred to the general account in accordance with subpart GGG of this part or subpart D of part 73 of this chapter.

(c) *Serial numbers for allocated CAIR SO_2 allowances.* When recording the allocation of CAIR SO_2 allowances issued by a permitting authority under § 96.288, the Administrator will assign each such CAIR SO_2 allowance a unique identification number that will include digits identifying the year of the control period for which the CAIR SO_2 allowance is allocated.

§ 96.254 Compliance with CAIR SO_2 emissions limitation.

(a) *Allowance transfer deadline.* The CAIR SO_2 allowances are available to be deducted for compliance with a source's CAIR SO_2 emissions limitation for a control period in a given calendar year only if the CAIR SO_2 allowances:

(1) Were allocated for the control period in the year or a prior year;

(2) Are held in the compliance account as of the allowance transfer deadline for the control period or are transferred into the compliance account by a CAIR SO_2 allowance transfer correctly submitted for recordation under § 96.260 by the allowance transfer deadline for the control period; and

(3) Are not necessary for deduction for excess emissions for a prior control period under paragraph (d) of this section or for deduction under part 77 of this chapter.

(b) *Deductions for compliance.* Following the recordation, in accordance with § 96.261, of CAIR SO_2 allowance transfers submitted for recordation in a source's compliance account by the allowance transfer deadline for a control period, the Administrator will deduct from the compliance account CAIR SO_2 allowances available under paragraph (a) of this section in order to determine whether the source meets the CAIR SO_2 emissions limitation for the control period as follows:

(1) For a CAIR SO_2 source subject to an Acid Rain emissions limitation, the Administrator will, in the following order:

(i) Deduct the amount of CAIR SO_2 allowances, available under paragraph (a) of this section and not issued by a permitting authority under § 96.288, that is required under §§ 73.35(b) and (c) of this part. If there are sufficient CAIR SO_2 allowances to complete this deduction, the deduction will be treated as satisfying the requirements of §§ 73.35(b) and (c) of this chapter.

(ii) Deduct the amount of CAIR SO_2 allowances, available under paragraph (a) of this section and not issued by a permitting authority under § 96.288, that is required under §§ 73.35(d) and 77.5 of this part. If there are sufficient CAIR SO_2 allowances to complete this deduction, the deduction will be treated as satisfying the requirements of §§ 73.35(d) and 77.5 of this chapter.

(iii) Treating the CAIR SO_2 allowances deducted under paragraph (b)(1)(i) of this section as also being deducted under this paragraph (b)(1)(iii), deduct CAIR SO_2 allowances available under paragraph (a) of this section (including any issued by a permitting authority under § 96.288) in order to determine whether the source meets the CAIR SO_2 emissions limitation for the control period, as follows:

(A) Until the tonnage equivalent of the CAIR SO_2 allowances deducted equals, or exceeds in accordance with paragraphs (c)(1) and (2) of this section, the number of tons of total sulfur dioxide emissions, determined in accordance with subpart HHH of this part, from all CAIR SO_2 units at the source for the control period; or

(B) If there are insufficient CAIR SO_2 allowances to complete the deductions in paragraph (b)(1)(iii)(A) of this section, until no more CAIR SO_2 allowances available under paragraph (a) of this section (including any issued by a permitting authority under § 96.288) remain in the compliance account.

(2) For a CAIR SO_2 source not subject to an Acid Rain emissions limitation, the Administrator will deduct CAIR SO_2 allowances available under paragraph (a) of this section (including any issued by a permitting authority under §96.288) in order to determine whether the source meets the CAIR SO_2 emissions limitation for the control period, as follows:

(i) Until the tonnage equivalent of the CAIR SO_2 allowances deducted equals, or exceeds in accordance with paragraphs (c)(1) and (2) of this section, the number of tons of total sulfur dioxide emissions, determined in accordance with subpart HHH of this part, from all CAIR SO_2 units at the source for the control period; or

(ii) If there are insufficient CAIR SO_2 allowances to complete the deductions in paragraph (b)(2)(i) of this section, until no more CAIR SO_2 allowances available under paragraph (a) of this section (including any issued by a permitting authority under § 96.288) remain in the compliance account.

(c)(1) *Identification of CAIR SO_2 allowances by serial number.* The CAIR authorized account representative for a source's compliance account may request that specific CAIR SO_2 allowances, identified by serial number, in the compliance account be deducted for emissions or excess emissions for a control period in accordance with paragraph (b) or (d) of this section. Such request shall be submitted to the Administrator by the allowance transfer deadline for the control period and include, in a format prescribed by the Administrator, the identification of the CAIR SO_2 source and the appropriate serial numbers.

(2) *First-in, first-out.* The Administrator will deduct CAIR SO_2 allowances under paragraph (b) or (d) of this section from the source's compliance account, in the absence of an identification or in the case of a partial identification of CAIR SO_2 allowances by serial number under paragraph (c)(1) of this section, on a first-in, first-out (FIFO) accounting basis in the following order:

(i) Any CAIR SO_2 allowances that were allocated to the units at the source for a control period before 2010, in the order of recordation;

(ii) Any CAIR SO_2 allowances that were allocated to any unit for a control period before 2010 and transferred and recorded in the compliance account pursuant to subpart GGG of this part or subpart D of part 73 of this chapter, in the order of recordation;

(iii) Any CAIR SO_2 allowances that were allocated to the units at the source for a control period during 2010 through 2014, in the order of recordation;

(iv) Any CAIR SO_2 allowances that were allocated to any unit for a control period during 2010 through 2014 and transferred and recorded in the compliance account pursuant to subpart GGG of this part or subpart D of part 73 of this chapter, in the order of recordation;

(v) Any CAIR SO_2 allowances that were allocated to the units at the source for a control period in 2015 or later, in the order of recordation; and

(vi) Any CAIR SO_2 allowances that were allocated to any unit for a control period in 2015 or later and transferred and recorded in the compliance account pursuant to subpart GGG of this part or subpart D of part 73 of this chapter, in the order of recordation.

(d) Deductions for excess emissions. (1) After making the deductions for compliance under paragraph (b) of this section for a control period in a calendar year in which the CAIR SO_2 source has excess emissions, the Administrator will deduct from the source's compliance account the tonnage equivalent in CAIR SO_2 allowances, allocated for the control period in the immediately following calendar year (including any issued by a permitting authority under § 96.288), equal to, or exceeding in

NMED Exhibit 7f

accordance with paragraphs (c)(1) and (2) of this section, 3 times the number of tons of the source's excess emissions.

(2) Any allowance deduction required under paragraph (d)(1) of this section shall not affect the liability of the owners and operators of the CAIR SO_2 source or the CAIR SO_2 units at the source for any fine, penalty, or assessment, or their obligation to comply with any other remedy, for the same violations, as ordered under the Clean Air Act or applicable State law.

(e) *Recordation of deductions.* The Administrator will record in the appropriate compliance account all deductions from such an account under paragraph (b) or (d) of this section.

(f) *Administrator's action on submissions.* (1) The Administrator may review and conduct independent audits concerning any submission under the CAIR SO_2 Trading Program and make appropriate adjustments of the information in the submissions.

(2) The Administrator may deduct CAIR SO_2 allowances from or transfer CAIR SO_2 allowances to a source's compliance account based on the information in the submissions, as adjusted under paragraph (f)(1) of this section.

§ 96.255 Banking.

(a) CAIR SO_2 allowances may be banked for future use or transfer in a compliance account or a general account in accordance with paragraph (b) of this section.

(b) Any CAIR SO_2 allowance that is held in a compliance account or a general account will remain in such account unless and until the CAIR SO_2 allowance is deducted or transferred under § 96.254, § 96.256, or subpart GGG of this part.

§ 96.256 Account error.

The Administrator may, at his or her sole discretion and on his or her own motion, correct any error in any CAIR SO_2 Allowance Tracking System account. Within 10 business days of making such correction, the Administrator will notify the CAIR authorized account representative for the account.

§ 96.257 Closing of general accounts.

(a) The CAIR authorized account representative of a general account may submit to the Administrator a request to close the account, which shall include a correctly submitted allowance transfer under § 96.260 for any CAIR SO_2 allowances in the account to one or more other CAIR SO_2 Allowance Tracking System accounts.

(b) If a general account has no allowance transfers in or out of the account for a 12-month period or longer and does not contain any CAIR SO_2 allowances, the Administrator may notify the CAIR authorized account representative for the account that the account will be closed following 20 business days after the notice is sent. The account will be closed after the 20-day period unless, before the end of the 20-day period, the Administrator receives a correctly submitted transfer of CAIR SO_2 allowances into the account under § 96.260 or a statement submitted by the CAIR authorized account representative demonstrating to the satisfaction of the Administrator good cause as to why the account should not be closed.

Subpart GGG—CAIR SO_2 Allowance Transfers

§ 96.260 Submission of CAIR SO_2 allowance transfers.

(a) A CAIR authorized account representative seeking recordation of a CAIR SO_2 allowance transfer shall submit the transfer to the Administrator. To be considered correctly submitted, the CAIR SO_2 allowance transfer shall include the following elements, in a format specified by the Administrator:

(1) The account numbers of both the transferor and transferee accounts;

(2) The serial number of each CAIR SO_2 allowance that is in the transferor account and is to be transferred; and

(3) The name and signature of the CAIR authorized account representatives of the transferor and transferee accounts and the dates signed.

(b)(1) The CAIR authorized account representative for the transferee account can meet the requirements in paragraph (a)(3) of this section by submitting, in a format prescribed by the Administrator, a statement signed by the CAIR authorized account representative and identifying each account into which any transfer of allowances, submitted on or after the date on which the Administrator receives such statement, is authorized. Such authorization shall be binding on any CAIR authorized account representative for such account and shall apply to all transfers into the account that are submitted on or after such date of receipt, unless and until the Administrator receives a statement signed by the CAIR authorized account representative retracting the authorization for the account.

(2) The statement under paragraph (b)(1) of this section shall include the following: ''By this signature I authorize any transfer of allowances into each account listed herein, except that I do not waive any remedies under State or Federal law to obtain correction of any erroneous transfers into such accounts. This authorization shall be binding on any CAIR authorized account representative for such account unless and until a statement signed by the CAIR authorized account representative retracting this authorization for the account is received by the Administrator.''

§ 96.261 EPA recordation.

(a) Within 5 business days (except as necessary to perform a transfer in perpetuity of CAIR SO_2 allowances allocated to a CAIR SO_2 unit or as provided in paragraph (b) of this section) of receiving a CAIR SO_2 allowance transfer, the Administrator will record a CAIR SO_2 allowance transfer by moving each CAIR SO_2 allowance from the transferor account to the transferee account as specified by the request, provided that:

(1) The transfer is correctly submitted under § 96.260; and

(2) The transferor account includes each CAIR SO_2 allowance identified by serial number in the transfer.

(b) A CAIR SO_2 allowance transfer that is submitted for recordation after the allowance transfer deadline for a control period and that includes any CAIR SO_2 allowances allocated for any control period before such allowance transfer deadline will not be recorded until after the Administrator completes the deductions under § 96.254 for the control period immediately before such allowance transfer deadline.

(c) Where a CAIR SO_2 allowance transfer submitted for recordation fails to meet the requirements of paragraph (a) of this section, the Administrator will not record such transfer.

§ 96.262 Notification.

(a) *Notification of recordation.* Within 5 business days of recordation of a CAIR SO_2 allowance transfer under § 96.261, the Administrator will notify the CAIR authorized account representatives of both the transferor and transferee accounts.

(b) *Notification of non-recordation.* Within 10 business days of receipt of a CAIR SO_2 allowance transfer that fails to meet the requirements of § 96.261(a), the Administrator will notify the CAIR authorized account representatives of both accounts subject to the transfer of:

(1) A decision not to record the transfer, and

(2) The reasons for such non-recordation.

(c) Nothing in this section shall preclude the submission of a CAIR SO_2 allowance transfer for recordation following notification of non-recordation.

Subpart HHH—Monitoring and Reporting

§ 96.270 General requirements.

The owners and operators, and to the extent applicable, the CAIR designated representative, of a CAIR SO_2 unit, shall comply with the monitoring, recordkeeping, and reporting requirements as provided in this subpart and in subparts F and G of part 75 of this chapter. For purposes of complying with such requirements, the definitions in § 96.202 and in § 72.2 of this chapter shall apply, and the terms ''affected unit,'' ''designated representative,'' and ''continuous emission monitoring system'' (or ''CEMS'') in part 75 of this chapter shall be deemed to refer to the terms ''CAIR SO_2 unit,'' ''CAIR designated representative,'' and ''continuous emission monitoring system'' (or ''CEMS'') respectively, as defined in § 96.202. The owner or operator of a unit that is not a CAIR SO_2 unit but that is monitored under § 75.16(b)(2) of this chapter shall comply with the same monitoring, recordkeeping, and reporting requirements as a CAIR SO_2 unit.

(a) *Requirements for installation, certification, and data accounting.* The owner or operator of each CAIR SO_2 unit shall:

(1) Install all monitoring systems required under this subpart for monitoring SO_2 mass emissions and individual unit heat input (including all systems required to monitor SO_2 concentration, stack gas moisture content, stack gas flow rate, CO_2 or O_2 concentration, and fuel flow rate, as applicable, in accordance with §§ 75.11 and 75.16 of this chapter);

(2) Successfully complete all certification tests required under § 96.271 and meet all other requirements of this subpart and part 75 of this chapter applicable to the monitoring systems under paragraph (a)(1) of this section; and

(3) Record, report, and quality-assure the data from the monitoring systems under paragraph (a)(1) of this section.

(b) *Compliance deadlines.* The owner or operator shall meet the monitoring system certification and other requirements of paragraphs (a)(1) and (2) of this section on or before the following dates. The owner or operator shall record, report, and quality-assure the data from the monitoring systems under paragraph (a)(1) of this section on and after the following dates.

(1) For the owner or operator of a CAIR SO_2 unit that commences commercial operation before July 1, 2008, by January 1, 2009.

(2) For the owner or operator of a CAIR SO_2 unit that commences commercial operation on or after July 1, 2008, by the later of the following dates:

(i) January 1, 2009; or

(ii) 90 unit operating days or 180 calendar days, whichever occurs first, after the date on which the unit commences commercial operation.

(3) For the owner or operator of a CAIR SO_2 unit for which construction of a new stack or flue or installation of add-on SO_2 emission controls is completed after the applicable deadline under paragraph (b)(1), (2), (4), or (5) of this section, by 90 unit operating days or 180 calendar days, whichever occurs first, after the date on which emissions first exit to the atmosphere through the new stack or flue or add-on SO_2 emissions controls.

(4) Notwithstanding the dates in paragraphs (b)(1) and (2) of this section, for the owner or operator of a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart III of this part, by the date specified in § 96.284(b).

(5) Notwithstanding the dates in paragraphs (b)(1) and (2) of this section and solely for purposes of § 96.206(c)(2), for the owner or operator of a CAIR SO_2 opt-in unit under subpart III of this part, by the date on which the CAIR SO_2 opt-in unit enters the CAIR SO_2 Trading Program as provided in § 96.284(g).

(c) *Reporting data.* (1) Except as provided in paragraph (c)(2) of this section, the owner or operator of a CAIR SO_2 unit that does not meet the applicable compliance date set forth in paragraph (b) of this section for any monitoring system under paragraph (a)(1) of this section shall, for each such monitoring system, determine, record, and report maximum potential (or, as appropriate, minimum potential) values for SO_2 concentration, SO_2 emission rate, stack gas flow rate, stack gas moisture content, fuel flow rate, and any other parameters required to determine SO_2 mass emissions and heat input in accordance with § 75.31(b)(2) or (c)(3) of this chapter or section 2.4 of appendix D to part 75 of this chapter, as applicable.

(2) The owner or operator of a CAIR SO_2 unit that does not meet the applicable compliance date set forth in paragraph (b)(3) of this section for any monitoring system under paragraph (a)(1) of this section shall, for each such monitoring system, determine, record, and report substitute data using the applicable missing data procedures in subpart D of or appendix D to part 75 of this chapter, in lieu of the maximum potential (or, as appropriate, minimum potential) values, for a parameter if the owner or operator demonstrates that there is continuity between the data streams for that parameter before and after the construction or installation under paragraph (b)(3) of this section.

(d) *Prohibitions.* (1) No owner or operator of a CAIR SO_2 unit shall use any alternative monitoring system, alternative reference method, or any other alternative to any requirement of this subpart without having obtained prior written approval in accordance with § 96.275.

(2) No owner or operator of a CAIR SO_2 unit shall operate the unit so as to discharge, or allow to be discharged, SO_2 emissions to the atmosphere without accounting for all such emissions in accordance with the applicable provisions of this subpart and part 75 of this chapter.

(3) No owner or operator of a CAIR SO_2 unit shall disrupt the continuous emission monitoring system, any portion thereof, or any other approved emission monitoring method, and thereby avoid monitoring and recording SO_2 mass emissions discharged into the atmosphere, except for periods of recertification or periods when calibration, quality assurance testing, or maintenance is performed in accordance with the applicable provisions of this subpart and part 75 of this chapter.

(4) No owner or operator of a CAIR SO_2 unit shall retire or permanently discontinue use of the continuous emission monitoring system, any component thereof, or any other approved monitoring system under this subpart, except under any one of the following circumstances:

(i) During the period that the unit is covered by an exemption under § 96.205 that is in effect;

(ii) The owner or operator is monitoring emissions from the unit with another certified monitoring system approved, in accordance with the applicable provisions of this subpart and part 75 of this chapter, by the permitting authority for use at that unit that provides emission data for the same pollutant or parameter as the retired or discontinued monitoring system; or

(iii) The CAIR designated representative submits notification of the date of certification testing of a replacement monitoring system for the retired or discontinued monitoring system in accordance with § 96.271(d)(3)(i).

NMED Exhibit 7f

§ 96.271 Initial certification and recertification procedures.

(a) The owner or operator of a CAIR SO_2 unit shall be exempt from the initial certification requirements of this section for a monitoring system under § 96.270(a)(1) if the following conditions are met:

(1) The monitoring system has been previously certified in accordance with part 75 of this chapter; and

(2) The applicable quality-assurance and quality-control requirements of § 75.21 of this chapter and appendix B and appendix D to part 75 of this chapter are fully met for the certified monitoring system described in paragraph (a)(1) of this section.

(b) The recertification provisions of this section shall apply to a monitoring system under § 96.270(a)(1) exempt from initial certification requirements under paragraph (a) of this section.

(c) If the Administrator has previously approved a petition under §§ 75.16(b)(2)(ii) of this chapter for apportioning the SO_2 mass emissions measured in a common stack or a petition under § 75.66 of this chapter for an alternative to a requirement in § 75.11 or § 75.16 of this chapter, the CAIR designated representative shall resubmit the petition to the Administrator under § 96.275(a) to determine whether the approval applies under the CAIR SO_2 Trading Program.

(d) Except as provided in paragraph (a) of this section, the owner or operator of a CAIR SO_2 unit shall comply with the following initial certification and recertification procedures, for a continuous monitoring system (*i.e.*, a continuous emission monitoring system and an excepted monitoring system under appendix D to part 75 of this chapter) under § 96.270(a)(1). The owner or operator of a unit that qualifies to use the low mass emissions excepted monitoring methodology under § 75.19 of this chapter or that qualifies to use an alternative monitoring system under subpart E of part 75 of this chapter shall comply with the procedures in paragraph (e) or (f) of this section respectively.

(1) *Requirements for initial certification.* The owner or operator shall ensure that each continuous monitoring system under § 96.270(a)(1) (including the automated data acquisition and handling system) successfully completes all of the initial certification testing required under § 75.20 of this chapter by the applicable deadline in § 96.270(b). In addition, whenever the owner or operator installs a monitoring system to meet the requirements of this subpart in a location where no such monitoring system was previously installed, initial certification in accordance with § 75.20 of this chapter is required.

(2) *Requirements for recertification.* Whenever the owner or operator makes a replacement, modification, or change in any certified continuous emission monitoring system under § 96.270(a)(1) that may significantly affect the ability of the system to accurately measure or record SO_2 mass emissions or heat input rate or to meet the quality-assurance and quality-control requirements of § 75.21 of this chapter or appendix B to part 75 of this chapter, the owner or operator shall recertify the monitoring system in accordance with § 75.20(b) of this chapter. Furthermore, whenever the owner or operator makes a replacement, modification, or change to the flue gas handling system or the unit's operation that may significantly change the stack flow or concentration profile, the owner or operator shall recertify each continuous emission monitoring system whose accuracy is potentially affected by the change, in accordance with § 75.20(b) of this chapter. Examples of changes to a continuous emission monitoring system that require recertification include: Replacement of the analyzer, complete replacement of an existing continuous emission monitoring system, or change in location or orientation of the sampling probe or site. Any fuel flowmeter system under § 96.270(a)(1) is subject to the recertification requirements in § 75.20(g)(6) of this chapter.

(3) *Approval process for initial certification and recertification.* Paragraphs (d)(3)(i) through (iv) of this section apply to both initial certification and recertification of a continuous monitoring system under § 96.270(a)(1). For recertifications, replace the words ''certification'' and ''initial certification'' with the word ''recertification'', replace the word ''certified'' with the word ''recertified,'' and follow the procedures in §§ 75.20(b)(5) and (g)(7) of this chapter in lieu of the procedures in paragraph (d)(3)(v) of this section.

(i) *Notification of certification.* The CAIR designated representative shall submit to the permitting authority, the appropriate EPA Regional Office, and the Administrator written notice of the dates of certification testing, in accordance with § 96.273.

(ii) *Certification application.* The CAIR designated representative shall submit to the permitting authority a certification application for each monitoring system. A complete certification application shall include the information specified in § 75.63 of this chapter.

(iii) *Provisional certification date.* The provisional certification date for a monitoring system shall be determined in accordance with § 75.20(a)(3) of this chapter. A provisionally certified monitoring system may be used under the CAIR SO_2 Trading Program for a period not to exceed 120 days after receipt by the permitting authority of the complete certification application for the monitoring system under paragraph (d)(3)(ii) of this section. Data measured and recorded by the provisionally certified monitoring system, in accordance with the requirements of part 75 of this chapter, will be considered valid quality-assured data (retroactive to the date and time of provisional certification), provided that the permitting authority does not invalidate the provisional certification by issuing a notice of disapproval within 120 days of the date of receipt of the complete certification application by the permitting authority.

(iv) *Certification application approval process.* The permitting authority will issue a written notice of approval or disapproval of the certification application to the owner or operator within 120 days of receipt of the complete certification application under paragraph (d)(3)(ii) of this section. In the event the permitting authority does not issue such a notice within such 120-day period, each monitoring system that meets the applicable performance requirements of part 75 of this chapter and is included in the certification application will be deemed certified for use under the CAIR SO_2 Trading Program.

(A) *Approval notice.* If the certification application is complete and shows that each monitoring system meets the applicable performance requirements of part 75 of this chapter, then the permitting authority will issue a written notice of approval of the certification application within 120 days of receipt.

(B) *Incomplete application notice.* If the certification application is not complete, then the permitting authority will issue a written notice of incompleteness that sets a reasonable date by which the CAIR designated representative must submit the additional information required to complete the certification application. If the CAIR designated representative does not comply with the notice of incompleteness by the specified date, then the permitting authority may issue a notice of disapproval under paragraph (d)(3)(iv)(C) of this section. The 120-day review period shall not begin before receipt of a complete certification application.

(C) *Disapproval notice.* If the certification application shows that any monitoring system does not meet the performance requirements of part 75 of this chapter or if the certification application is incomplete and the requirement for disapproval under paragraph (d)(3)(iv)(B) of this section is met, then the permitting authority will issue a written notice of disapproval of the certification application. Upon issuance of such notice of disapproval, the provisional certification is invalidated by the permitting authority and the data measured and recorded by each uncertified monitoring system shall not be considered valid quality-assured data beginning with the date and hour of provisional certification (as defined under § 75.20(a)(3) of this chapter). The owner or operator shall follow the procedures for loss of certification in paragraph (d)(3)(v) of this section for each monitoring system that is disapproved for initial certification.

(D) *Audit decertification.* The permitting authority or, for a CAIR SO_2 opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart III of this part, the Administrator may issue a notice of disapproval of the certification status of a monitor in accordance with § 96.272(b).

(v) *Procedures for loss of certification.* If the permitting authority or the Administrator issues a notice of disapproval of a certification application under paragraph (d)(3)(iv)(C) of this section or a notice of disapproval of certification status under paragraph (d)(3)(iv)(D) of this section, then:

(A) The owner or operator shall substitute the following values, for each disapproved monitoring system, for each hour of unit operation during the period of invalid data specified under § 75.20(a)(4)(iii), § 75.20(g)(7), or § 75.21(e) of this chapter and continuing until the applicable date and hour specified under § 75.20(a)(5)(i) or (g)(7) of this chapter:

(*1*) For a disapproved SO_2 pollutant concentration monitor and disapproved flow monitor, respectively, the maximum potential concentration of SO_2 and the maximum potential flow rate, as defined in sections 2.1.1.1 and 2.1.4.1 of appendix A to part 75 of this chapter.

(*2*) For a disapproved moisture monitoring system and disapproved diluent gas monitoring system, respectively, the minimum potential moisture percentage and either the maximum potential CO_2 concentration or the minimum potential O_2 concentration (as applicable), as defined in sections 2.1.5, 2.1.3.1, and 2.1.3.2 of appendix A to part 75 of this chapter.

(*3*) For a disapproved fuel flowmeter system, the maximum potential fuel flow rate, as defined in section 2.4.2.1 of appendix D to part 75 of this chapter.

(B) The CAIR designated representative shall submit a notification of certification retest dates and a new certification application in accordance with paragraphs (d)(3)(i) and (ii) of this section.

(C) The owner or operator shall repeat all certification tests or other requirements that were failed by the monitoring system, as indicated in the permitting authority's or the Administrator's notice of disapproval, no later than 30 unit operating days after the date of issuance of the notice of disapproval.

(e) Initial certification and recertification procedures for units using the low mass emission excepted methodology under § 75.19 of this chapter. The owner or operator of a unit qualified to use the low mass emissions (LME) excepted methodology under § 75.19 of this chapter shall meet the applicable certification and recertification requirements in §§ 75.19(a)(2) and 75.20(h) of this chapter. If the owner or operator of such a unit elects to certify a fuel flowmeter system for heat input determination, the owner or operator shall also meet the certification and recertification requirements in § 75.20(g) of this chapter.

(f) Certification/recertification procedures for alternative monitoring systems. The CAIR designated representative of each unit for which the owner or operator intends to use an alternative monitoring system approved by the Administrator and, if applicable, the permitting authority under subpart E of part 75 of this chapter shall comply with the applicable notification and application procedures of § 75.20(f) of this chapter.

§ 96.272 Out of control periods.

(a) Whenever any monitoring system fails to meet the quality-assurance and quality-control requirements or data validation requirements of part 75 of this chapter, data shall be substituted using the applicable missing data procedures in subpart D of or appendix D to part 75 of this chapter.

(b) *Audit decertification.* Whenever both an audit of a monitoring system and a review of the initial certification or recertification application reveal that any monitoring system should not have been certified or recertified because it did not meet a particular performance specification or other requirement under § 96.271 or the applicable provisions of part 75 of this chapter, both at the time of the initial certification or recertification application submission and at the time of the audit, the permitting authority or, for a CAIR SO_2 opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart III of this part, the Administrator will issue a notice of disapproval of the certification status of such monitoring system. For the purposes of this paragraph, an audit shall be either a field audit or an audit of any information submitted to the permitting authority or the Administrator. By issuing the notice of disapproval, the permitting authority or the Administrator revokes prospectively the certification status of the monitoring system. The data measured and recorded by the monitoring system shall not be considered valid quality-assured data from the date of issuance of the notification of the revoked certification status until the date and time that the owner or operator completes subsequently approved initial certification or recertification tests for the monitoring system. The owner or operator shall follow the applicable initial certification or recertification procedures in § 96.271 for each disapproved monitoring system.

§ 96.273 Notifications.

The CAIR designated representative for a CAIR SO_2 unit shall submit written notice to the permitting authority and the Administrator in accordance with § 75.61 of this chapter, except that if the unit is not subject to an Acid Rain emissions limitation, the notification is only required to be sent to the permitting authority.

§ 96.274 Recordkeeping and reporting.

(a) *General provisions.* The CAIR designated representative shall comply with all recordkeeping and reporting requirements in this section, the applicable recordkeeping and reporting requirements in subparts F and G of part 75 of this chapter, and the requirements of § 96.210(e)(1).

(b) *Monitoring plans.* The owner or operator of a CAIR SO_2 unit shall comply with requirements of § 75.62 of this chapter and, for a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart III of this part, §§ 96.283 and 96.284(a).

(c) *Certification applications.* The CAIR designated representative shall submit an application to the permitting authority within 45 days after completing all initial certification or recertification tests required under § 96.271, including the information required under § 75.63 of this chapter.

(d) *Quarterly reports.* The CAIR designated representative shall submit quarterly reports, as follows:

(1) The CAIR designated representative shall report the SO_2 mass emissions data and heat input data for the CAIR SO_2 unit, in an electronic quarterly report in a format prescribed by the Administrator, for each calendar quarter beginning with:

(i) For a unit that commences commercial operation before July 1, 2008, the calendar quarter covering January 1, 2009 through March 31, 2009; or

(ii) For a unit that commences commercial operation on or after July 1, 2008, the calendar quarter corresponding to the earlier of the date of provisional certification or the applicable deadline for initial certification under § 96.270(b), unless that quarter is the third or fourth quarter of 2008, in which case reporting shall commence in the quarter covering January 1, 2009 through March 31, 2009.

(2) The CAIR designated representative shall submit each quarterly report to the Administrator within 30 days following the end of the calendar quarter covered by the report. Quarterly reports shall be submitted in the manner specified in § 75.64 of this chapter.

(3) For CAIR SO_2 units that are also subject to an Acid Rain emissions limitation or the CAIR NO_X Annual Trading Program or CAIR NO_X Ozone Season Trading Program, quarterly reports shall include the applicable data and information required by subparts F through H of part 75 of this chapter as applicable, in addition to the SO_2 mass emission data, heat input data, and other information required by this subpart.

(e) *Compliance certification.* The CAIR designated representative shall submit to the Administrator a compliance certification (in a format prescribed by the Administrator) in support of each quarterly report based on reasonable inquiry of those persons with primary responsibility for ensuring that all of the unit's emissions are correctly and fully monitored. The certification shall state that:

(1) The monitoring data submitted were recorded in accordance with the applicable requirements of this subpart and part 75 of this chapter, including the quality assurance procedures and specifications; and

(2) For a unit with add-on SO_2 emission controls and for all hours where SO_2 data are substituted in accordance with § 75.34(a)(1) of this chapter, the add-on emission controls were operating within the range of parameters listed in the quality assurance/quality control program under appendix B to part 75 of this chapter and the substitute data values do not systematically underestimate SO_2 emissions.

§ 96.275 Petitions.

(a) The CAIR designated representative of a CAIR SO_2 unit that is subject to an Acid Rain emissions limitation may submit a petition under § 75.66 of this chapter to the Administrator requesting approval to apply an alternative to any requirement of this subpart. Application of an alternative to any requirement of this subpart is in accordance with this subpart only to the extent that the petition is approved in writing by the Administrator, in consultation with the permitting authority.

(b) The CAIR designated representative of a CAIR SO_2 unit that is not subject to an Acid Rain emissions limitation may submit a petition under § 75.66 of this chapter to the permitting authority and the Administrator requesting approval to apply an alternative to any requirement of this subpart. Application of an alternative to any requirement of this subpart is in accordance with this subpart only to the extent that the petition is approved in writing by both the permitting authority and the Administrator.

§ 96.276 Additional requirements to provide heat input data.

The owner or operator of a CAIR SO_2 unit that monitors and reports SO_2 mass emissions using a SO_2 concentration system and a flow system shall also monitor and report heat input rate at the unit level using the procedures set forth in part 75 of this chapter.

Subpart III—CAIR SO_2 Opt-in Units

§ 96.280 Applicability.

A CAIR SO_2 opt-in unit must be a unit that:

(a) Is located in the State;

(b) Is not a CAIR SO_2 unit under § 96.204 and is not covered by a retired unit exemption under § 96.205 that is in effect;

(c) Is not covered by a retired unit exemption under § 72.8 of this chapter that is in effect and is not an opt-in source under part 74 of this chapter;

(d) Has or is required or qualified to have a title V operating permit or other federally enforceable permit; and

(e) Vents all of its emissions to a stack and can meet the monitoring, recordkeeping, and reporting requirements of subpart HHH of this part.

§ 96.281 General.

(a) Except as otherwise provided in §§ 96.201 through 96.204, §§ 96.206 through 96.208, and subparts BBB and CCC and subparts FFF through HHH of this part, a CAIR SO_2 opt-in unit shall be treated as a CAIR SO_2 unit for purposes of applying such sections and subparts of this part.

(b) Solely for purposes of applying, as provided in this subpart, the requirements of subpart HHH of this part to a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under this subpart, such unit shall be treated as a CAIR SO_2 unit before issuance of a CAIR opt-in permit for such unit.

§ 96.282 CAIR designated representative.

Any CAIR SO_2 opt-in unit, and any unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under this subpart, located at the same source as one or more CAIR SO_2 units shall have the same CAIR designated representative and alternate CAIR designated representative as such CAIR SO_2 units.

§ 96.283 Applying for CAIR opt-in permit.

(a) *Applying for initial CAIR opt-in permit.* The CAIR designated representative of a unit meeting the requirements for a CAIR SO_2 opt-in unit in § 96.280 may apply for an initial CAIR opt-in permit at any time, except as provided under § 96.286(f) and (g), and, in order to apply, must submit the following:

(1) A complete CAIR permit application under § 96.222;

(2) A certification, in a format specified by the permitting authority, that the unit:

(i) Is not a CAIR SO_2 unit under § 96.204 and is not covered by a retired unit exemption under § 96.205 that is in effect;

(ii) Is not covered by a retired unit exemption under § 72.8 of this chapter that is in effect;

(iii) Is not and, so long as the unit is a CAIR opt-in unit, will not become, an opt-in source under part 74 of this chapter;

(iv) Vents all of its emissions to a stack; and

NMED Exhibit 7f

(v) Has documented heat input for more than 876 hours during the 6 months immediately preceding submission of the CAIR permit application under § 96.222;

(3) A monitoring plan in accordance with subpart HHH of this part;

(4) A complete certificate of representation under § 96.213 consistent with § 96.282, if no CAIR designated representative has been previously designated for the source that includes the unit; and

(5) A statement, in a format specified by the permitting authority, whether the CAIR designated representative requests that the unit be allocated CAIR SO_2 allowances under § 96.288(c) (subject to the conditions in §§ 96.284(h) and 96.286(g)).

(b) *Duty to reapply.* (1) The CAIR designated representative of a CAIR SO_2 opt-in unit shall submit a complete CAIR permit application under § 96.222 to renew the CAIR opt-in unit permit in accordance with the permitting authority's regulations for title V operating permits, or permitting authority's regulations for other federally enforceable permits if applicable, addressing permit renewal.

(2) Unless the permitting authority issues a notification of acceptance of withdrawal of the CAIR opt-in unit from the CAIR SO_2 Trading Program in accordance with § 96.286 or the unit becomes a CAIR SO_2 unit under § 96.204, the CAIR SO_2 opt-in unit shall remain subject to the requirements for a CAIR SO_2 opt-in unit, even if the CAIR designated representative for the CAIR SO_2 opt-in unit fails to submit a CAIR permit application that is required for renewal of the CAIR opt-in permit under paragraph (b)(1) of this section.

§ 96.284 Opt-in process.

The permitting authority will issue or deny a CAIR opt-in permit for a unit for which an initial application for a CAIR opt-in permit under § 96.283 is submitted in accordance with the following:

(a) Interim review of monitoring plan. The permitting authority and the Administrator will determine, on an interim basis, the sufficiency of the monitoring plan accompanying the initial application for a CAIR opt-in permit under § 96.283. A monitoring plan is sufficient, for purposes of interim review, if the plan appears to contain information demonstrating that the SO_2 emissions rate and heat input of the unit are monitored and reported in accordance with subpart HHH of this part. A determination of sufficiency shall not be construed as acceptance or approval of the monitoring plan.

(b) *Monitoring and reporting.* (1)(i) If the permitting authority and the Administrator determine that the monitoring plan is sufficient under paragraph (a) of this section, the owner or operator shall monitor and report the SO_2 emissions rate and the heat input of the unit and all other applicable parameters, in accordance with subpart HHH of this part, starting on the date of certification of the appropriate monitoring systems under subpart HHH of this part and continuing until a CAIR opt-in permit is denied under § 96.284(f) or, if a CAIR opt-in permit is issued, the date and time when the unit is withdrawn from the CAIR SO_2 Trading Program in accordance with § 96.286.

(ii) The monitoring and reporting under paragraph (b)(1)(i) of this section shall include the entire control period immediately before the date on which the unit enters the CAIR SO_2 Trading Program under § 96.284(g), during which period monitoring system availability must not be less than 90 percent under subpart HHH of this part and the unit must be in full compliance with any applicable State or Federal emissions or emissions-related requirements.

(2) To the extent the SO_2 emissions rate and the heat input of the unit are monitored and reported in accordance with subpart HHH of this part for one or more control periods, in addition to the control period under paragraph (b)(1)(ii) of this section, during which control periods monitoring system availability is not less than 90 percent under subpart HHH of this part and the unit is in full compliance with any applicable State or Federal emissions or emissions-related requirements and which control periods begin not more than 3 years before the unit enters the CAIR SO_2 Trading Program under § 96.284(g), such information shall be used as provided in paragraphs (c) and (d) of this section.

(c) *Baseline heat input.* The unit's baseline heat rate shall equal:

(1) If the unit's SO_2 emissions rate and heat input are monitored and reported for only one control period, in accordance with paragraph (b)(1) of this section, the unit's total heat input (in mmBtu) for the control period; or

(2) If the unit's SO_2 emissions rate and heat input are monitored and reported for more than one control period, in accordance with paragraphs (b)(1) and (2) of this section, the average of the amounts of the unit's total heat input (in mmBtu) for the control period under paragraph (b)(1)(ii) of this section and the control periods under paragraph (b)(2) of this section.

(d) *Baseline SO_2* emission rate. The unit's baseline SO_2 emission rate shall equal:

(1) If the unit's SO_2 emissions rate and heat input are monitored and reported for only one control period, in accordance with paragraph (b)(1) of this section, the unit's SO_2 emissions rate (in lb/mmBtu) for the control period;

(2) If the unit's SO_2 emissions rate and heat input are monitored and reported for more than one control period, in accordance with paragraphs (b)(1) and (2) of this section, and the unit does not have add-on SO_2 emission controls during any such control periods, the average of the amounts of the unit's SO_2 emissions rate (in lb/mmBtu) for the control period under paragraph (b)(1)(ii) of this section and the control periods under paragraph (b)(2) of this section; or

(3) If the unit's SO_2 emissions rate and heat input are monitored and reported for more than one control period, in accordance with paragraphs (b)(1) and (2) of this section, and the unit has add-on SO_2 emission controls during any such control periods, the average of the amounts of the unit's SO_2 emissions rate (in lb/mmBtu) for such control period during which the unit has add-on SO_2 emission controls.

(e) Issuance of CAIR opt-in permit. After calculating the baseline heat input and the baseline SO_2 emissions rate for the unit under paragraphs (c) and (d) of this section and if the permitting authority determines that the CAIR designated representative shows that the unit meets the requirements for a CAIR SO_2 opt-in unit in § 96.280 and meets the elements certified in § 96.283(a)(2), the permitting authority will issue a CAIR opt-in permit. The permitting authority will provide a copy of the CAIR opt-in permit to the Administrator, who will then establish a compliance account for the source that includes the CAIR SO_2 opt-in unit unless the source already has a compliance account.

(f) *Issuance of denial of CAIR opt-in permit.* Notwithstanding paragraphs (a) through (e) of this section, if at any time before issuance of a CAIR opt-in permit for the unit, the permitting authority determines that the CAIR designated representative fails to show that the unit meets the requirements for a CAIR SO_2 opt-in unit in § 96.280 or meets the elements certified in § 96.283(a)(2), the permitting authority will issue a denial of a CAIR SO_2 opt-in permit for the unit.

(g) *Date of entry into CAIR SO_2 Trading Program.* A unit for which an initial CAIR opt-in permit is issued by the permitting authority shall become a CAIR SO_2 opt-in unit, and a CAIR SO_2 unit, as of the later of January 1, 2010

NMED Exhibit 7f

or January 1 of the first control period during which such CAIR opt-in permit is issued.

(h) Repowered CAIR SO_2 opt-in unit. (1) If CAIR designated representative requests, and the permitting authority issues a CAIR opt-in permit providing for, allocation to a CAIR SO_2 opt-in unit of CAIR SO_2 allowances under § 96.288(c) and such unit is repowered after its date of entry into the CAIR SO_2 Trading Program under paragraph (g) of this section, the repowered unit shall be treated as a CAIR SO_2 opt-in unit replacing the original CAIR SO_2 opt-in unit, as of the date of start-up of the repowered unit's combustion chamber.

(2) Notwithstanding paragraphs (c) and (d) of this section, as of the date of start-up under paragraph (h)(1) of this section, the repowered unit shall be deemed to have the same date of commencement of operation, date of commencement of commercial operation, baseline heat input, and baseline SO_2 emission rate as the original CAIR SO_2 opt-in unit, and the original CAIR SO_2 opt-in unit shall no longer be treated as a CAIR opt-in unit or a CAIR SO_2 unit.

§ 96.285 CAIR opt-in permit contents.

(a) Each CAIR opt-in permit will contain:

(1) All elements required for a complete CAIR permit application under § 96.222;

(2) The certification in § 96.283(a)(2);

(3) The unit's baseline heat input under § 96.284(c);

(4) The unit's baseline SO_2 emission rate under § 96.284(d);

(5) A statement whether the unit is to be allocated CAIR SO_2 allowances under § 96.288(c) (subject to the conditions in §§ 96.284(h) and 96.286(g));

(6) A statement that the unit may withdraw from the CAIR SO_2 Trading Program only in accordance with § 96.286; and

(7) A statement that the unit is subject to, and the owners and operators of the unit must comply with, the requirements of § 96.287.

(b) Each CAIR opt-in permit is deemed to incorporate automatically the definitions of terms under § 96.202 and, upon recordation by the Administrator under subpart FFF or GGG of this part or this subpart, every allocation, transfer, or deduction of CAIR SO_2 allowances to or from the compliance account of the source that includes a CAIR SO_2 opt-in unit covered by the CAIR opt-in permit.

§ 96.286 Withdrawal from CAIR SO_2 Trading Program.

Except as provided under paragraph (g) of this section, a CAIR SO_2 opt-in unit may withdraw from the CAIR SO_2 Trading Program, but only if the permitting authority issues a notification to the CAIR designated representative of the CAIR SO_2 opt-in unit of the acceptance of the withdrawal of the CAIR SO_2 opt-in unit in accordance with paragraph (d) of this section.

(a) *Requesting withdrawal.* In order to withdraw a CAIR opt-in unit from the CAIR SO_2 Trading Program, the CAIR designated representative of the CAIR SO_2 opt-in unit shall submit to the permitting authority a request to withdraw effective as of midnight of December 31 of a specified calendar year, which date must be at least 4 years after December 31 of the year of entry into the CAIR SO_2 Trading Program under § 96.284(g). The request must be submitted no later than 90 days before the requested effective date of withdrawal.

(b) *Conditions for withdrawal.* Before a CAIR SO_2 opt-in unit covered by a request under paragraph (a) of this section may withdraw from the CAIR SO_2 Trading Program and the CAIR opt-in permit may be terminated under paragraph (e) of this section, the following conditions must be met:

(1) For the control period ending on the date on which the withdrawal is to be effective, the source that includes the CAIR SO_2 opt-in unit must meet the requirement to hold CAIR SO_2 allowances under § 96.206(c) and cannot have any excess emissions.

(2) After the requirement for withdrawal under paragraph (b)(1) of this section is met, the Administrator will deduct from the compliance account of the source that includes the CAIR SO_2 opt-in unit CAIR SO_2 allowances equal in number to and allocated for the same or a prior control period as any CAIR SO_2 allowances allocated to the CAIR SO_2 opt-in unit under § 96.188 for any control period for which the withdrawal is to be effective. If there are no remaining CAIR SO_2 units at the source, the Administrator will close the compliance account, and the owners and operators of the CAIR SO_2 opt-in unit may submit a CAIR SO_2 allowance transfer for any remaining CAIR SO_2 allowances to another CAIR SO_2 Allowance Tracking System in accordance with subpart GGG of this part.

(c) *Notification.* (1) After the requirements for withdrawal under paragraphs (a) and (b) of this section are met (including deduction of the full amount of CAIR SO_2 allowances required), the permitting authority will issue a notification to the CAIR designated representative of the CAIR SO_2 opt-in unit of the acceptance of the withdrawal of the CAIR SO_2 opt-in unit as of midnight on December 31 of the calendar year for which the withdrawal was requested.

(2) If the requirements for withdrawal under paragraphs (a) and (b) of this section are not met, the permitting authority will issue a notification to the CAIR designated representative of the CAIR SO_2 opt-in unit that the CAIR SO_2 opt-in unit's request to withdraw is denied. Such CAIR SO_2 opt-in unit shall continue to be a CAIR SO_2 opt-in unit.

(d) *Permit amendment.* After the permitting authority issues a notification under paragraph (c)(1) of this section that the requirements for withdrawal have been met, the permitting authority will revise the CAIR permit covering the CAIR SO_2 opt-in unit to terminate the CAIR opt-in permit for such unit as of the effective date specified under paragraph (c)(1) of this section. The unit shall continue to be a CAIR SO_2 opt-in unit until the effective date of the termination and shall comply with all requirements under the CAIR SO_2 Trading Program concerning any control periods for which the unit is a CAIR SO_2 opt-in unit, even if such requirements arise or must be complied with after the withdrawal takes effect.

(e) *Reapplication upon failure to meet conditions of withdrawal.* If the permitting authority denies the CAIR SO_2 opt-in unit's request to withdraw, the CAIR designated representative may submit another request to withdraw in accordance with paragraphs (a) and (b) of this section.

(f) Ability to reapply to the CAIR SO_2 Trading Program. Once a CAIR SO_2 opt-in unit withdraws from the CAIR SO_2 Trading Program and its CAIR opt-in permit is terminated under this section, the CAIR designated representative may not submit another application for a CAIR opt-in permit under § 96.283 for such CAIR SO_2 opt-in unit before the date that is 4 years after the date on which the withdrawal became effective. Such new application for a CAIR opt-in permit will be treated as an initial application for a CAIR opt-in permit under § 96.284.

(g) Inability to withdraw. Notwithstanding paragraphs (a) through (f) of this section, a CAIR SO_2 opt-in unit shall not be eligible to withdraw from the CAIR SO_2 Trading Program if the CAIR designated representative of the CAIR SO_2 opt-in unit requests, and the permitting authority issues a CAIR opt-in permit providing for, allocation to the CAIR SO_2 opt-in unit of CAIR SO_2 allowances under § 96.288(c).

NMED Exhibit 7f

§ 96.287 Change in regulatory status.

(a) *Notification.* If a CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204, then the CAIR designated representative shall notify in writing the permitting authority and the Administrator of such change in the CAIR SO_2 opt-in unit's regulatory status, within 30 days of such change.

(b) *Permitting authority's and Administrator's actions.* (1) If a CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204, the permitting authority will revise the CAIR SO_2 opt-in unit's CAIR opt-in permit to meet the requirements of a CAIR permit under § 96.223 as of the date on which the CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204.

(2)(i) The Administrator will deduct from the compliance account of the source that includes a CAIR SO_2 opt-in unit that becomes a CAIR SO_2 unit under § 96.204, CAIR SO_2 allowances equal in number to and allocated for the same or a prior control period as:

(A) Any CAIR SO_2 allowances allocated to the CAIR SO_2 opt-in unit under § 96.288 for any control period after the date on which the CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204; and

(B) If the date on which the CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204 is not December 31, the CAIR SO_2 allowances allocated to the CAIR SO_2 opt-in unit under § 96.288 for the control period that includes the date on which the CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204, multiplied by the ratio of the number of days, in the control period, starting with the date on which the CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204 divided by the total number of days in the control period and rounded to the nearest whole allowance as appropriate.

(ii) The CAIR designated representative shall ensure that the compliance account of the source that includes the CAIR SO_2 unit that becomes a CAIR SO_2 unit under § 96.204 contains the CAIR SO_2 allowances necessary for completion of the deduction under paragraph (b)(2)(i) of this section.

(3)(i) For every control period after the date on which a CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204, the CAIR SO_2 opt-in unit will be treated, solely for purposes of CAIR SO_2 allowance allocations under § 96.242, as a unit that commences operation on the date on which the CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204 and will be allocated CAIR SO_2 allowances under § 96.242.

(ii) Notwithstanding paragraph (b)(3)(i) of this section, if the date on which the CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204 is not January 1, the following number of CAIR SO_2 allowances will be allocated to the CAIR SO_2 opt-in unit (as a CAIR SO_2 unit) under § 96.242 for the control period that includes the date on which the CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204:

(A) The number of CAIR SO_2 allowances otherwise allocated to the CAIR SO_2 opt-in unit (as a CAIR SO_2 unit) under § 96.242 for the control period multiplied by;

(B) The ratio of the number of days, in the control period, starting with the date on which the CAIR SO_2 opt-in unit becomes a CAIR SO_2 unit under § 96.204, divided by the total number of days in the control period; and

(C) Rounded to the nearest whole allowance as appropriate.

§ 96.288 SO_2 allowance allocations to CAIR SO_2 opt-in units.

(a) *Timing requirements.* (1) When the CAIR opt-in permit is issued under § 96.284(e), the permitting authority will allocate CAIR SO_2 allowances to the CAIR SO_2 opt-in unit, and submit to the Administrator the allocation for the control period in which a CAIR SO_2 opt-in unit enters the CAIR SO_2 Trading Program under § 96.284(g), in accordance with paragraph (b) or (c) of this section.

(2) By no later than October 31 of the control period in which a CAIR opt-in unit enters the CAIR SO_2 Trading Program under § 96.284(g) and October 31 of each year thereafter, the permitting authority will allocate CAIR SO_2 allowances to the CAIR SO_2 opt-in unit, and submit to the Administrator the allocation for the control period that includes such submission deadline and in which the unit is a CAIR SO_2 opt-in unit, in accordance with paragraph (b) or (c) of this section.

(b) *Calculation of allocation.* For each control period for which a CAIR SO_2 opt-in unit is to be allocated CAIR SO_2 allowances, the permitting authority will allocate in accordance with the following procedures:

(1) The heat input (in mmBtu) used for calculating the CAIR SO_2 allowance allocation will be the lesser of:

(i) The CAIR SO_2 opt-in unit's baseline heat input determined under § 96.284(c); or

(ii) The CAIR SO_2 opt-in unit's heat input, as determined in accordance with subpart HHH of this part, for the immediately prior control period, except when the allocation is being calculated for the control period in which the CAIR SO_2 opt-in unit enters the CAIR SO_2 Trading Program under § 96.284(g).

(2) The SO_2 emission rate (in lb/mmBtu) used for calculating CAIR SO_2 allowance allocations will be the lesser of:

(i) The CAIR SO_2 opt-in unit's baseline SO_2 emissions rate (in lb/mmBtu) determined under § 96.284(d) and multiplied by 70 percent; or

(ii) The most stringent State or Federal SO_2 emissions limitation applicable to the CAIR SO_2 opt-in unit at any time during the control period for which CAIR SO_2 allowances are to be allocated.

(3) The permitting authority will allocate CAIR SO_2 allowances to the CAIR SO_2 opt-in unit with a tonnage equivalent equal to, or less than by the smallest possible amount, the heat input under paragraph (b)(1) of this section, multiplied by the SO_2 emission rate under paragraph (b)(2) of this section, and divided by 2,000 lb/ton.

(c) Notwithstanding paragraph (b) of this section and if the CAIR designated representative requests, and the permitting authority issues a CAIR opt-in permit providing for, allocation to a CAIR SO_2 opt-in unit of CAIR SO_2 allowances under this paragraph (subject to the conditions in §§ 96.284(h) and 96.286(g)), the permitting authority will allocate to the CAIR SO_2 opt-in unit as follows:

(1) For each control period in 2010 through 2014 for which the CAIR SO_2 opt-in unit is to be allocated CAIR SO_2 allowances,

(i) The heat input (in mmBtu) used for calculating CAIR SO_2 allowance allocations will be determined as described in paragraph (b)(1) of this section.

(ii) The SO_2 emission rate (in lb/mmBtu) used for calculating CAIR SO_2 allowance allocations will be the lesser of:

(A) The CAIR SO_2 opt-in unit's baseline SO_2 emissions rate (in lb/mmBtu) determined under § 96.284(d); or

(B) The most stringent State or Federal SO_2 emissions limitation applicable to the CAIR SO_2 opt-in unit at any time during the control period in which the CAIR SO_2 opt-in unit enters the CAIR SO_2 Trading Program under § 96.284(g).

(iii) The permitting authority will allocate CAIR SO_2 allowances to the CAIR SO_2 opt-in unit with a tonnage equivalent equal to, or less than by the smallest possible amount, the heat input under paragraph (c)(1)(i) of this section, multiplied by the SO_2 emission rate

NMED Exhibit 7f

under paragraph (c)(1)(ii) of this section, and divided by 2,000 lb/ton.

(2) For each control period in 2015 and thereafter for which the CAIR SO_2 opt-in unit is to be allocated CAIR SO_2 allowances,

(i) The heat input (in mmBtu) used for calculating the CAIR SO_2 allowance allocations will be determined as described in paragraph (b)(1) of this section.

(ii) The SO_2 emission rate (in lb/mmBtu) used for calculating the CAIR SO_2 allowance allocation will be the lesser of:

(A) The CAIR SO_2 opt-in unit's baseline SO_2 emissions rate (in lb/mmBtu) determined under § 96.284(d) multiplied by 10 percent; or

(B) The most stringent State or Federal SO_2 emissions limitation applicable to the CAIR SO_2 opt-in unit at any time during the control period for which CAIR SO_2 allowances are to be allocated.

(iii) The permitting authority will allocate CAIR SO_2 allowances to the CAIR SO_2 opt-in unit with a tonnage equivalent equal to, or less than by the smallest possible amount, the heat input under paragraph (c)(2)(i) of this section, multiplied by the SO_2 emission rate under paragraph (c)(2)(ii) of this section, and divided by 2,000 lb/ton.

(d) *Recordation.* (1) The Administrator will record, in the compliance account of the source that includes the CAIR SO_2 opt-in unit, the CAIR SO_2 allowances allocated by the permitting authority to the CAIR SO_2 opt-in unit under paragraph (a)(1) of this section.

(2) By December 1 of the control period in which a CAIR opt-in unit enters the CAIR SO_2 Trading Program under § 96.284(g), and December 1 of each year thereafter, the Administrator will record, in the compliance account of the source that includes the CAIR SO_2 opt-in unit, the CAIR SO_2 allowances allocated by the permitting authority to the CAIR SO_2 opt-in unit under paragraph (a)(2) of this section.

■ 4. Part 96 is amended by adding subparts AAAA through CCCC, adding and reserving subpart DDDD and adding subparts EEEE through IIII to read as follows:

Subpart AAAA—CAIR NO_X Ozone Season Trading Program General Provisions

Subpart BBBB—CAIR Designated Representative for CAIR NO_X Ozone Season Sources

Subpart CCCC—Permits

Subpart DDDD—[Reserved]

Subpart EEEE—CAIR NO_X Ozone Season Allowance Allocations

Subpart FFFF—CAIR NO_X Ozone Season Allowance Tracking System

Subpart GGGG—CAIR NO_X Ozone Season Allowance Transfers

Subpart HHHH—Monitoring and Reporting

Subpart IIII—CAIR NO_X Ozone Season Opt-in Units

Subpart AAAA—CAIR NO_X Ozone Season Trading Program General Provisions

§ 96.301 Purpose.

This subpart and subparts BBBB through IIII establish the model rule comprising general provisions and the designated representative, permitting, allowance, monitoring, and opt-in provisions for the State Clean Air Interstate Rule (CAIR) NO_X Ozone Season Trading Program, under section 110 of the Clean Air Act and § 51.123 of this chapter, as a means of mitigating interstate transport of ozone and nitrogen oxides. The owner or operator of a unit or a source shall comply with the requirements of this subpart and subparts BBBB through IIII as a matter of federal law only if the State with jurisdiction over the unit and the source incorporates by reference such subparts or otherwise adopts the requirements of such subparts in accordance with §51.123(aa)(1) or (2), of this chapter, the State submits to the Administrator one or more revisions of the State implementation plan that include such adoption, and the Administrator approves such revisions. If the State adopts the requirements of such subparts in accordance with § 51.123(aa)(1) or (2), (bb), or (dd) of this chapter, then the State authorizes the Administrator to assist the State in implementing the CAIR NO_X Ozone Season Trading Program by carrying out the functions set forth for the Administrator in such subparts.

§ 96.302 Definitions.

The terms used in this subpart and subparts BBBB through IIII shall have the meanings set forth in this section as follows:

Account number means the identification number given by the Administrator to each CAIR NO_X Ozone Season Allowance Tracking System account.

Acid Rain emissions limitation means a limitation on emissions of sulfur dioxide or nitrogen oxides under the Acid Rain Program.

Acid Rain Program means a multi-state sulfur dioxide and nitrogen oxides air pollution control and emission reduction program established by the Administrator under title IV of the CAA and parts 72 through 78 of this chapter.

Administrator means the Administrator of the United States Environmental Protection Agency or the Administrator's duly authorized representative.

Allocate or *allocation* means, with regard to CAIR NO_X Ozone Season allowances issued under subpart EEEE, the determination by the permitting authority or the Administrator of the amount of such CAIR NO_X Ozone Season allowances to be initially credited to a CAIR NO_X Ozone Season unit or a new unit set-aside and, with regard to CAIR NO_X Ozone Season allowances issued under § 96.388 or § 51.123(aa)(2)(iii)(A) of this chapter, the determination by the permitting authority of the amount of such CAIR NO_X Ozone Season allowances to be initially credited to a CAIR NO_X Ozone Season unit.

Allowance transfer deadline means, for a control period, midnight of November 30, if it is a business day, or, if November 30 is not a business day, midnight of the first business day thereafter immediately following the control period and is the deadline by which a CAIR NO_X Ozone Season allowance transfer must be submitted for recordation in a CAIR NO_X Ozone Season source's compliance account in order to be used to meet the source's CAIR NO_X Ozone Season emissions limitation for such control period in accordance with § 96.354.

Alternate CAIR designated representative means, for a CAIR NO_X Ozone Season source and each CAIR NO_X Ozone Season unit at the source, the natural person who is authorized by the owners and operators of the source and all such units at the source in accordance with subparts BBBB and IIII of this part, to act on behalf of the CAIR designated representative in matters pertaining to the CAIR NO_X Ozone Season Trading Program. If the CAIR NO_X Ozone Season source is also a CAIR NO_X source, then this natural person shall be the same person as the alternate CAIR designated representative under the CAIR NO_X Annual Trading Program. If the CAIR NO_X Ozone Season source is also a CAIR SO_2 source, then this natural person shall be the same person as the alternate CAIR designated representative under the CAIR SO_2 Trading Program. If the CAIR NO_X Ozone Season source is also subject to the Acid Rain Program, then this natural person shall be the same person as the alternate designated representative under the Acid Rain Program.

Automated data acquisition and handling system or *DAHS* means that component of the continuous emission monitoring system, or other emissions monitoring system approved for use under subpart HHHH of this part, designed to interpret and convert individual output signals from pollutant concentration monitors, flow monitors, diluent gas monitors, and other component parts of the monitoring system to produce a continuous record of the measured parameters in the measurement units required by subpart HHHH of this part.

Boiler means an enclosed fossil- or other-fuel-fired combustion device used to produce heat and to transfer heat to recirculating water, steam, or other medium.

Bottoming-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful thermal energy and at least some of the reject heat from the useful thermal energy application or process is then used for electricity production.

CAIR authorized account representative means, with regard to a general account, a responsible natural person who is authorized, in accordance with subparts BBBB and IIII of this part, to transfer and otherwise dispose of CAIR NO_X Ozone Season allowances held in the general account and, with regard to a compliance account, the CAIR designated representative of the source.

CAIR designated representative means, for a CAIR NO_X Ozone Season source and each CAIR NO_X Ozone Season unit at the source, the natural person who is authorized by the owners and operators of the source and all such units at the source, in accordance with subparts BBBB and IIII of this part, to represent and legally bind each owner and operator in matters pertaining to the CAIR NO_X Ozone Season Trading Program. If the CAIR NO_X Ozone Season source is also a CAIR NO_X source, then this natural person shall be the same person as the CAIR designated representative under the CAIR NO_X Annual Trading Program. If the CAIR NO_X Ozone Season source is also a CAIR SO_2 source, then this natural person shall be the same person as the CAIR designated representative under the CAIR SO_2 Trading Program. If the CAIR NO_X Ozone Season source is also subject to the Acid Rain Program, then this natural person shall be the same person as the designated representative under the Acid Rain Program.

CAIR NO_X Annual Trading Program means a multi-state nitrogen oxides air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts AA through II of this part and § 51.123 of this chapter, as a means of mitigating interstate transport of fine particulates and nitrogen oxides.

CAIR NO_X Ozone Season allowance means a limited authorization issued by the permitting authority under subpart EEEE of this part, § 96.388, or § 51.123(aa)(2)(iii)(A), (bb)(2)(iii) or (iv), or (dd)(3) or (4) of this chapter to emit one ton of nitrogen oxides during a control period of the specified calendar year for which the authorization is allocated or of any calendar year thereafter under the CAIR NO_X Ozone Season Trading Program or a limited authorization issued by the permitting authority for a control period during 2003 through 2008 under the NO_X Budget Trading Program to emit one ton of nitrogen oxides during a control period, provided that the provision in § 51.121(b)(2)(i)(E) of this chapter shall not be used in applying this definition. An authorization to emit nitrogen oxides that is not issued under provisions of a State implementation plan that meet the requirements of § 51.121(p) of this chapter or § 51.123(aa)(1) or (2), (and (bb)(1)), (bb)(2), or (dd) of this chapter shall not be a CAIR NO_X Ozone Season allowance.

CAIR NO_X Ozone Season allowance deduction or *deduct CAIR NO_X Ozone Season allowances* means the permanent withdrawal of CAIR NO_X Ozone Season allowances by the Administrator from a compliance account in order to account for a specified number of tons of total nitrogen oxides emissions from all CAIR NO_X Ozone Season units at a CAIR NO_X Ozone Season source for a control period, determined in accordance with subpart HHHH of this part, or to account for excess emissions.

CAIR NO_X Ozone Season Allowance Tracking System means the system by which the Administrator records allocations, deductions, and transfers of CAIR NO_X Ozone Season allowances under the CAIR NO_X Ozone Season Trading Program. Such allowances will be allocated, held, deducted, or transferred only as whole allowances.

CAIR NO_X Ozone Season Allowance Tracking System account means an account in the CAIR NO_X Ozone Season Allowance Tracking System established by the Administrator for purposes of recording the allocation, holding, transferring, or deducting of CAIR NO_X Ozone Season allowances.

CAIR NO_X Ozone Season allowances held or *hold CAIR NO_X Ozone Season allowances* means the CAIR NO_X Ozone Season allowances recorded by the Administrator, or submitted to the Administrator for recordation, in accordance with subparts FFFF, GGGG, and IIII of this part, in a CAIR NO_X Ozone Season Allowance Tracking System account.

CAIR NO_X Ozone Season emissions limitation means, for a CAIR NO_X Ozone Season source, the tonnage equivalent of the CAIR NO_X Ozone Season allowances available for deduction for the source under § 96.354(a) and (b) for a control period.

CAIR NO_X Ozone Season Trading Program means a multi-state nitrogen oxides air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts AAAA through IIII of this part and § 51.123 of this chapter, as a means of mitigating interstate transport of ozone and nitrogen oxides.

CAIR NO_X Ozone Season source means a source that includes one or more CAIR NO_X Ozone Season units.

CAIR NO_X Ozone Season unit means a unit that is subject to the CAIR NO_X Ozone Season Trading Program under § 96.304 and, except for purposes of § 96.305 and subpart EEEE of this part, a CAIR NO_X Ozone Season opt-in unit under subpart IIII of this part.

CAIR NO_X source means a source that includes one or more CAIR NO_X units.

CAIR NO_X unit means a unit that is subject to the CAIR NO_X Annual Trading Program under § 96.104 and a CAIR NO_X opt-in unit under subpart II of this part.

CAIR permit means the legally binding and federally enforceable written document, or portion of such document, issued by the permitting authority under subpart CCCC of this part, including any permit revisions, specifying the CAIR NO_X Ozone Season Trading Program requirements applicable to a CAIR NO_X Ozone Season source, to each CAIR NO_X Ozone Season unit at the source, and to the owners and operators and the CAIR designated representative of the source and each such unit.

CAIR SO_2 source means a source that includes one or more CAIR SO_2 units.

CAIR SO_2 Trading Program means a multi-state sulfur dioxide air pollution control and emission reduction program approved and administered by the Administrator in accordance with subparts AAA through III of this part and § 51.124 of this chapter, as a means of mitigating interstate transport of fine particulates and sulfur dioxide.

CAIR SO_2 unit means a unit that is subject to the CAIR SO_2 Trading Program under § 96.204 and a CAIR SO_2 opt-in unit under subpart III of this part.

Clean Air Act or *CAA* means the Clean Air Act, 42 U.S.C. 7401, *et seq.*

Coal means any solid fuel classified as anthracite, bituminous, subbituminous, or lignite.

Coal-derived fuel means any fuel (whether in a solid, liquid, or gaseous state) produced by the mechanical, thermal, or chemical processing of coal.

Coal-fired means:

(1) Except for purposes of subpart EEEE of this part, combusting any amount of coal or coal-derived fuel, alone or in combination with any amount of any other fuel, during any year; or

(2) For purposes of subpart EEEE of this part, combusting any amount of coal or coal-derived fuel, alone or in combination with any amount of any other fuel, during a specified year.

Cogeneration unit means a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine:

(1) Having equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through the sequential use of energy; and

(2) Producing during the 12-month period starting on the date the unit first produces electricity and during any calendar year after which the unit first produces electricity—

(i) For a topping-cycle cogeneration unit,

(A) Useful thermal energy not less than 5 percent of total energy output; and

(B) Useful power that, when added to one-half of useful thermal energy produced, is not less then 42.5 percent of total energy input, if useful thermal energy produced is 15 percent or more of total energy output, or not less than 45 percent of total energy input, if useful thermal energy produced is less than 15 percent of total energy output.

(ii) For a bottoming-cycle cogeneration unit, useful power not less than 45 percent of total energy input.

Combustion turbine means:

(1) An enclosed device comprising a compressor, a combustor, and a turbine and in which the flue gas resulting from the combustion of fuel in the combustor passes through the turbine, rotating the turbine; and

(2) If the enclosed device under paragraph (1) of this definition is combined cycle, any associated heat recovery steam generator and steam turbine.

Commence commercial operation means, with regard to a unit serving a generator:

(1) To have begun to produce steam, gas, or other heated medium used to generate electricity for sale or use, including test generation, except as provided in § 96.305.

(i) For a unit that is a CAIR NO_X Ozone Season unit under § 96.304 on the date the unit commences commercial operation as defined in paragraph (1) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of commercial operation.

(ii) For a unit that is a CAIR NO_X Ozone Season unit under § 96.304 on the date the unit commences commercial operation as defined in paragraph (1) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of commercial operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(2) Notwithstanding paragraph (1) of this definition and except as provided in § 96.305, for a unit that is not a CAIR NO_X Ozone Season unit under § 96.304 on the date the unit commences commercial operation as defined in paragraph (1) of this definition and is not a unit under paragraph (3) of this definition, the unit's date for commencement of commercial operation shall be the date on which the unit becomes a CAIR NO_X Ozone Season unit under § 96.304.

(i) For a unit with a date for commencement of commercial operation as defined in paragraph (2) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of commercial operation.

(ii) For a unit with a date for commencement of commercial operation as defined in paragraph (2) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of commercial operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(3) Notwithstanding paragraph (1) of this definition and except as provided in § 96.384(h) or § 96.387(b)(3), for a CAIR NO_X Ozone Season opt-in unit or

NMED Exhibit 7f

a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart IIII of this part, the unit's date for commencement of commercial operation shall be the date on which the owner or operator is required to start monitoring and reporting the NO_X emissions rate and the heat input of the unit under § 96.384(b)(1)(i).

(i) For a unit with a date for commencement of commercial operation as defined in paragraph (3) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of commercial operation.

(ii) For a unit with a date for commencement of commercial operation as defined in paragraph (3) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of commercial operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(4) Notwithstanding paragraphs (1) through (3) of this definition, for a unit not serving a generator producing electricity for sale, the unit's date of commencement of operation shall also be the unit's date of commencement of commercial operation.

Commence operation means:

(1) To have begun any mechanical, chemical, or electronic process, including, with regard to a unit, start-up of a unit's combustion chamber, except as provided in § 96.305.

(i) For a unit that is a CAIR NO_X Ozone Season unit under § 96.304 on the date the unit commences operation as defined in paragraph (1) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of operation.

(ii) For a unit that is a CAIR NO_X Ozone Season unit under § 96.304 on the date the unit commences operation as defined in paragraph (1) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

(2) Notwithstanding paragraph (1) of this definition and except as provided in § 96.305, for a unit that is not a CAIR NO_X Ozone Season unit under § 96.304 on the date the unit commences operation as defined in paragraph (1) of this definition and is not a unit under paragraph (3) of this definition, the unit's date for commencement of operation shall be the date on which the unit becomes a CAIR NO_X Ozone Season unit under § 96.304.

(i) For a unit with a date for commencement of operation as defined in paragraph (2) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of operation.

(ii) For a unit with a date for commencement of operation as defined in paragraph (2) of this definition and that is subsequently replaced by a unit at the same source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of operation as defined in paragraph (1),(2), or (3) of this definition as appropriate.

(3) Notwithstanding paragraph (1) of this definition and except as provided in § 96.384(h) or § 96.387(b)(3), for a CAIR NO_X Ozone Season opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart IIII of this part, the unit's date for commencement of operation shall be the date on which the owner or operator is required to start monitoring and reporting the NO_X emissions rate and the heat input of the unit under § 96.384(b)(1)(i).

(i) For a unit with a date for commencement of operation as defined in paragraph (3) of this definition and that subsequently undergoes a physical change (other than replacement of the unit by a unit at the same source), such date shall remain the unit's date of commencement of operation.

(ii) For a unit with a date for commencement of operation as defined in paragraph (3) of this definition and that is subsequently replaced by a unit at the source (*e.g.*, repowered), the replacement unit shall be treated as a separate unit with a separate date for commencement of operation as defined in paragraph (1), (2), or (3) of this definition as appropriate.

Common stack means a single flue through which emissions from 2 or more units are exhausted.

Compliance account means a CAIR NO_X Ozone Season Allowance Tracking System account, established by the Administrator for a CAIR NO_X Ozone Season source under subpart FFFF or IIII of this part, in which any CAIR NO_X Ozone Season allowance allocations for the CAIR NO_X Ozone Season units at the source are initially recorded and in which are held any CAIR NO_X Ozone Season allowances available for use for a control period in order to meet the source's CAIR NO_X Ozone Season emissions limitation in accordance with § 96.354.

Continuous emission monitoring system or *CEMS* means the equipment required under subpart HHHH of this part to sample, analyze, measure, and provide, by means of readings recorded at least once every 15 minutes (using an automated data acquisition and handling system (DAHS)), a permanent record of nitrogen oxides emissions, stack gas volumetric flow rate, stack gas moisture content, and oxygen or carbon dioxide concentration (as applicable), in a manner consistent with part 75 of this chapter. The following systems are the principal types of continuous emission monitoring systems required under subpart HHHH of this part:

(1) A flow monitoring system, consisting of a stack flow rate monitor and an automated data acquisition and handling system and providing a permanent, continuous record of stack gas volumetric flow rate, in standard cubic feet per hour (scfh);

(2) A nitrogen oxides concentration monitoring system, consisting of a NO_X pollutant concentration monitor and an automated data acquisition and handling system and providing a permanent, continuous record of NO_X emissions, in parts per million (ppm);

(3) A nitrogen oxides emission rate (or NO_X-diluent) monitoring system, consisting of a NO_X pollutant concentration monitor, a diluent gas (CO_2 or O_2) monitor, and an automated data acquisition and handling system and providing a permanent, continuous record of NO_X concentration, in parts per million (ppm), diluent gas concentration, in percent CO_2 or O_2, and NO_X emission rate, in pounds per million British thermal units (lb/mmBtu);

(4) A moisture monitoring system, as defined in § 75.11(b)(2) of this chapter and providing a permanent, continuous record of the stack gas moisture content, in percent H_2O;

(5) A carbon dioxide monitoring system, consisting of a CO_2 pollutant concentration monitor (or an oxygen monitor plus suitable mathematical equations from which the CO_2 concentration is derived) and an automated data acquisition and handling system and providing a permanent, continuous record of CO_2 emissions, in percent CO_2; and

NMED Exhibit 7f

(6) An oxygen monitoring system, consisting of an O_2 concentration monitor and an automated data acquisition and handling system and providing a permanent, continuous record of O_2 in percent O_2.

Control period or *ozone season* means the period beginning May 1 of a calendar year and ending on September 30 of the same year, inclusive.

Emissions means air pollutants exhausted from a unit or source into the atmosphere, as measured, recorded, and reported to the Administrator by the CAIR designated representative and as determined by the Administrator in accordance with subpart HHHH of this part.

Excess emissions means any ton of nitrogen oxides emitted by the CAIR NO_X Ozone Season units at a CAIR NO_X Ozone Season source during a control period that exceeds the CAIR NO_X Ozone Season emissions limitation for the source.

Fossil fuel means natural gas, petroleum, coal, or any form of solid, liquid, or gaseous fuel derived from such material.

Fossil-fuel-fired means, with regard to a unit, combusting any amount of fossil fuel in any calendar year.

Fuel oil means any petroleum-based fuel (including diesel fuel or petroleum derivatives such as oil tar) and any recycled or blended petroleum products or petroleum by-products used as a fuel whether in a liquid, solid, or gaseous state.

General account means a CAIR NO_X Ozone Season Allowance Tracking System account, established under subpart FFFF of this part, that is not a compliance account.

Generator means a device that produces electricity.

Gross electrical output means, with regard to a cogeneration unit, electricity made available for use, including any such electricity used in the power production process (which process includes, but is not limited to, any on-site processing or treatment of fuel combusted at the unit and any on-site emission controls).

Heat input means, with regard to a specified period of time, the product (in mmBtu/time) of the gross calorific value of the fuel (in Btu/lb) divided by 1,000,000 Btu/mmBtu and multiplied by the fuel feed rate into a combustion device (in lb of fuel/time), as measured, recorded, and reported to the Administrator by the CAIR designated representative and determined by the Administrator in accordance with subpart HHHH of this part and excluding the heat derived from preheated combustion air, recirculated flue gases, or exhaust from other sources.

Heat input rate means the amount of heat input (in mmBtu) divided by unit operating time (in hr) or, with regard to a specific fuel, the amount of heat input attributed to the fuel (in mmBtu) divided by the unit operating time (in hr) during which the unit combusts the fuel.

Life-of-the-unit, firm power contractual arrangement means a unit participation power sales agreement under which a utility or industrial customer reserves, or is entitled to receive, a specified amount or percentage of nameplate capacity and associated energy generated by any specified unit and pays its proportional amount of such unit's total costs, pursuant to a contract:

(1) For the life of the unit;

(2) For a cumulative term of no less than 30 years, including contracts that permit an election for early termination; or

(3) For a period no less than 25 years or 70 percent of the economic useful life of the unit determined as of the time the unit is built, with option rights to purchase or release some portion of the nameplate capacity and associated energy generated by the unit at the end of the period.

Maximum design heat input means, starting from the initial installation of a unit, the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis as specified by the manufacturer of the unit, or, starting from the completion of any subsequent physical change in the unit resulting in a decrease in the maximum amount of fuel per hour (in Btu/hr) that a unit is capable of combusting on a steady state basis, such decreased maximum amount as specified by the person conducting the physical change.

Monitoring system means any monitoring system that meets the requirements of subpart HHHH of this part, including a continuous emissions monitoring system, an alternative monitoring system, or an excepted monitoring system under part 75 of this chapter.

Most stringent State or Federal NO_X emissions limitation means, with regard to a unit, the lowest NO_X emissions limitation (in terms of lb/mmBtu) that is applicable to the unit under State or Federal law, regardless of the averaging period to which the emissions limitation applies.

Nameplate capacity means, starting from the initial installation of a generator, the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other deratings) as specified by the manufacturer of the generator or, starting from the completion of any subsequent physical change in the generator resulting in an increase in the maximum electrical generating output (in MWe) that the generator is capable of producing on a steady state basis and during continuous operation (when not restricted by seasonal or other deratings), such increased maximum amount as specified by the person conducting the physical change.

Oil-fired means, for purposes of subpart EEEE of this part, combusting fuel oil for more than 15.0 percent of the annual heat input in a specified year.

Operator means any person who operates, controls, or supervises a CAIR NO_X Ozone Season unit or a CAIR NO_X Ozone Season source and shall include, but not be limited to, any holding company, utility system, or plant manager of such a unit or source.

Owner means any of the following persons:

(1) With regard to a CAIR NO_X Ozone Season source or a CAIR NO_X Ozone Season unit at a source, respectively:

(i) Any holder of any portion of the legal or equitable title in a CAIR NO_X Ozone Season unit at the source or the CAIR NO_X Ozone Season unit;

(ii) Any holder of a leasehold interest in a CAIR NO_X Ozone Season unit at the source or the CAIR NO_X Ozone Season unit; or

(iii) Any purchaser of power from a CAIR NO_X Ozone Season unit at the source or the CAIR NO_X Ozone Season unit under a life-of-the-unit, firm power contractual arrangement; provided that, unless expressly provided for in a leasehold agreement, owner shall not include a passive lessor, or a person who has an equitable interest through such lessor, whose rental payments are not based (either directly or indirectly) on the revenues or income from such CAIR NO_X Ozone Season unit; or

(2) With regard to any general account, any person who has an ownership interest with respect to the CAIR NO_X Ozone Season allowances held in the general account and who is subject to the binding agreement for the CAIR authorized account representative to represent the person's ownership interest with respect to CAIR NO_X Ozone Season allowances.

Permitting authority means the State air pollution control agency, local agency, other State agency, or other agency authorized by the Administrator to issue or revise permits to meet the requirements of the CAIR NO_X Ozone

NMED Exhibit 7f

Season Trading Program in accordance with subpart CCCC of this part or, if no such agency has been so authorized, the Administrator.

Potential electrical output capacity means 33 percent of a unit's maximum design heat input, divided by 3,413 Btu/kWh, divided by 1,000 kWh/MWh, and multiplied by 8,760 hr/yr.

Receive or receipt of means, when referring to the permitting authority or the Administrator, to come into possession of a document, information, or correspondence (whether sent in hard copy or by authorized electronic transmission), as indicated in an official correspondence log, or by a notation made on the document, information, or correspondence, by the permitting authority or the Administrator in the regular course of business.

Recordation, record, or *recorded* means, with regard to CAIR NO_X Ozone Season allowances, the movement of CAIR NO_X Ozone Season allowances by the Administrator into or between CAIR NO_X Ozone Season Allowance Tracking System accounts, for purposes of allocation, transfer, or deduction.

Reference method means any direct test method of sampling and analyzing for an air pollutant as specified in § 75.22 of this chapter.

Repowered means, with regard to a unit, replacement of a coal-fired boiler with one of the following coal-fired technologies at the same source as the coal-fired boiler:

(1) Atmospheric or pressurized fluidized bed combustion;

(2) Integrated gasification combined cycle;

(3) Magnetohydrodynamics;

(4) Direct and indirect coal-fired turbines;

(5) Integrated gasification fuel cells; or

(6) As determined by the Administrator in consultation with the Secretary of Energy, a derivative of one or more of the technologies under paragraphs (1) through (5) of this definition and any other coal-fired technology capable of controlling multiple combustion emissions simultaneously with improved boiler or generation efficiency and with significantly greater waste reduction relative to the performance of technology in widespread commercial use as of January 1, 2005.

Serial number means, for a CAIR NO_X Ozone Season allowance, the unique identification number assigned to each CAIR NO_X Ozone Season allowance by the Administrator.

Sequential use of energy means:

(1) For a topping-cycle cogeneration unit, the use of reject heat from electricity production in a useful thermal energy application or process; or

(2) For a bottoming-cycle cogeneration unit, the use of reject heat from useful thermal energy application or process in electricity production.

Source means all buildings, structures, or installations located in one or more contiguous or adjacent properties under common control of the same person or persons. For purposes of section 502(c) of the Clean Air Act, a "source," including a "source" with multiple units, shall be considered a single "facility."

State means one of the States or the District of Columbia that adopts the CAIR NO_X Ozone Season Trading Program pursuant to § 51.123(aa)(1) or (2), (bb), or (dd) of this chapter.

Submit or serve means to send or transmit a document, information, or correspondence to the person specified in accordance with the applicable regulation:

(1) In person;

(2) By United States Postal Service; or

(3) By other means of dispatch or transmission and delivery. Compliance with any "submission" or "service" deadline shall be determined by the date of dispatch, transmission, or mailing and not the date of receipt.

Title V operating permit means a permit issued under title V of the Clean Air Act and part 70 or part 71 of this chapter.

Title V operating permit regulations means the regulations that the Administrator has approved or issued as meeting the requirements of title V of the Clean Air Act and part 70 or 71 of this chapter.

Ton means 2,000 pounds. For the purpose of determining compliance with the CAIR NO_X Ozone Season emissions limitation, total tons of nitrogen oxides emissions for a control period shall be calculated as the sum of all recorded hourly emissions (or the mass equivalent of the recorded hourly emission rates) in accordance with subpart HHHH of this part, but with any remaining fraction of a ton equal to or greater than 0.50 tons deemed to equal one ton and any remaining fraction of a ton less than 0.50 tons deemed to equal zero tons.

Topping-cycle cogeneration unit means a cogeneration unit in which the energy input to the unit is first used to produce useful power, including electricity, and at least some of the reject heat from the electricity production is then used to provide useful thermal energy.

Total energy input means, with regard to a cogeneration unit, total energy of all forms supplied to the cogeneration unit, excluding energy produced by the cogeneration unit itself.

Total energy output means, with regard to a cogeneration unit, the sum of useful power and useful thermal energy produced by the cogeneration unit.

Unit means a stationary, fossil-fuel-fired boiler or combustion turbine or other stationary, fossil-fuel-fired combustion device.

Unit operating day means a calendar day in which a unit combusts any fuel.

Unit operating hour or *hour of unit operation* means an hour in which a unit combusts any fuel.

Useful power means, with regard to a cogeneration unit, electricity or mechanical energy made available for use, excluding any such energy used in the power production process (which process includes, but is not limited to, any on-site processing or treatment of fuel combusted at the unit and any on-site emission controls).

Useful thermal energy means, with regard to a cogeneration unit, thermal energy that is:

(1) Made available to an industrial or commercial process (not a power production process), excluding any heat contained in condensate return or makeup water;

(2) Used in a heat application (e.g., space heating or domestic hot water heating); or

(3) Used in a space cooling application (i.e., thermal energy used by an absorption chiller).

Utility power distribution system means the portion of an electricity grid owned or operated by a utility and dedicated to delivering electricity to customers.

§ 96.303 Measurements, abbreviations, and acronyms.

Measurements, abbreviations, and acronyms used in this part are defined as follows:

Btu—British thermal unit.
CO_2—carbon dioxide.
1NO_X—nitrogen oxides. hr—hour.
kW—kilowatt electrical. kWh—kilowatt hour. mmBtu—million Btu.
MWe—megawatt electrical. MWh—megawatt hour.
O_2—oxygen. ppm—parts per million. lb—pound.
scfh—standard cubic feet per hour.
SO_2—sulfur dioxide.
H_2O—water.
yr-year.

§ 96.304 Applicability.

The following units in a State shall be CAIR NO_X Ozone Season units, and any

NMED Exhibit 7f

source that includes one or more such units shall be a CAIR NO_X Ozone Season source, subject to the requirements of this subpart and subparts BBBB through HHHH of this part:

(a) Except as provided in paragraph (b) of this section, a stationary, fossil-fuel-fired boiler or stationary, fossil-fuel-fired combustion turbine serving at any time, since the start-up of a unit's combustion chamber, a generator with nameplate capacity of more than 25 MWe producing electricity for sale.

(b) For a unit that qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity and continues to qualify as a cogeneration unit, a cogeneration unit serving at any time a generator with nameplate capacity of more than 25 MWe and supplying in any calendar year more than one-third of the unit's potential electric output capacity or 219,000 MWh, whichever is greater, to any utility power distribution system for sale. If a unit qualifies as a cogeneration unit during the 12-month period starting on the date the unit first produces electricity but subsequently no longer qualifies as a cogeneration unit, the unit shall be subject to paragraph (a) of this section starting on the day on which the unit first no longer qualifies as a cogeneration unit.

§ 96.305 Retired unit exemption.

(a)(1) Any CAIR NO_X Ozone Season unit that is permanently retired and is not a CAIR NO_X Ozone Season opt-in unit shall be exempt from the CAIR NO_X Ozone Season Trading Program, except for the provisions of this section, § 96.302, § 96.303, § 96.304, § 96.306(c)(4) through (8), § 96.307, and subparts EEEE through GGGG of this part.

(2) The exemption under paragraph (a)(1) of this section shall become effective the day on which the CAIR NO_X Ozone Season unit is permanently retired. Within 30 days of the unit's permanent retirement, the CAIR designated representative shall submit a statement to the permitting authority otherwise responsible for administering any CAIR permit for the unit and shall submit a copy of the statement to the Administrator. The statement shall state, in a format prescribed by the permitting authority, that the unit was permanently retired on a specific date and will comply with the requirements of paragraph (b) of this section.

(3) After receipt of the statement under paragraph (a)(2) of this section, the permitting authority will amend any permit under subpart CCCC of this part covering the source at which the unit is located to add the provisions and requirements of the exemption under paragraphs (a)(1) and (b) of this section.

(b) *Special provisions.* (1) A unit exempt under paragraph (a) of this section shall not emit any nitrogen oxides, starting on the date that the exemption takes effect.

(2) The permitting authority will allocate CAIR NO_X Ozone Season allowances under subpart EEEE of this part to a unit exempt under paragraph (a) of this section.

(3) For a period of 5 years from the date the records are created, the owners and operators of a unit exempt under paragraph (a) of this section shall retain at the source that includes the unit, records demonstrating that the unit is permanently retired. The 5-year period for keeping records may be extended for cause, at any time before the end of the period, in writing by the permitting authority or the Administrator. The owners and operators bear the burden of proof that the unit is permanently retired.

(4) The owners and operators and, to the extent applicable, the CAIR designated representative of a unit exempt under paragraph (a) of this section shall comply with the requirements of the CAIR NO_X Ozone Season Trading Program concerning all periods for which the exemption is not in effect, even if such requirements arise, or must be complied with, after the exemption takes effect.

(5) A unit exempt under paragraph (a) of this section and located at a source that is required, or but for this exemption would be required, to have a title V operating permit shall not resume operation unless the CAIR designated representative of the source submits a complete CAIR permit application under § 96.322 for the unit not less than 18 months (or such lesser time provided by the permitting authority) before the later of January 1, 2009 or the date on which the unit resumes operation.

(6) On the earlier of the following dates, a unit exempt under paragraph (a) of this section shall lose its exemption:

(i) The date on which the CAIR designated representative submits a CAIR permit application for the unit under paragraph (b)(5) of this section;

(ii) The date on which the CAIR designated representative is required under paragraph (b)(5) of this section to submit a CAIR permit application for the unit; or

(iii) The date on which the unit resumes operation, if the CAIR designated representative is not required to submit a CAIR permit application for the unit.

(7) For the purpose of applying monitoring, reporting, and recordkeeping requirements under subpart HHHH of this part, a unit that loses its exemption under paragraph (a) of this section shall be treated as a unit that commences operation and commercial operation on the first date on which the unit resumes operation.

§ 96.306 Standard requirements.

(a) *Permit requirements.* (1) The CAIR designated representative of each CAIR NO_X Ozone Season source required to have a title V operating permit and each CAIR NO_X Ozone Season unit required to have a title V operating permit at the source shall:

(i) Submit to the permitting authority a complete CAIR permit application under § 96.322 in accordance with the deadlines specified in § 96.321(a) and (b); and

(ii) Submit in a timely manner any supplemental information that the permitting authority determines is necessary in order to review a CAIR permit application and issue or deny a CAIR permit.

(2) The owners and operators of each CAIR NO_X Ozone Season source required to have a title V operating permit and each CAIR NO_X Ozone Season unit required to have a title V operating permit at the source shall have a CAIR permit issued by the permitting authority under subpart CCCC of this part for the source and operate the source and the unit in compliance with such CAIR permit.

(3) Except as provided in subpart IIII of this part, the owners and operators of a CAIR NO_X Ozone Season source that is not otherwise required to have a title V operating permit and each CAIR NO_X Ozone Season unit that is not otherwise required to have a title V operating permit are not required to submit a CAIR permit application, and to have a CAIR permit, under subpart CCCC of this part for such CAIR NO_X Ozone Season source and such CAIR NO_X Ozone Season unit.

(b) Monitoring, reporting, and recordkeeping requirements. (1) The owners and operators, and the CAIR designated representative, of each CAIR NO_X Ozone Season source and each CAIR NO_X Ozone Season unit at the source shall comply with the monitoring, reporting, and recordkeeping requirements of subpart HHHH of this part.

(2) The emissions measurements recorded and reported in accordance with subpart HHHH of this part shall be used to determine compliance by each CAIR NO_X Ozone Season source with the CAIR NO_X Ozone Season emissions

limitation under paragraph (c) of this section.

(c) *Nitrogen oxides ozone season emission requirements.* (1) As of the allowance transfer deadline for a control period, the owners and operators of each CAIR NO_X Ozone Season source and each CAIR NO_X Ozone Season unit at the source shall hold, in the source's compliance account, CAIR NO_X Ozone Season allowances available for compliance deductions for the control period under § 96.354(a) in an amount not less than the tons of total nitrogen oxides emissions for the control period from all CAIR NO_X Ozone Season units at the source, as determined in accordance with subpart HHHH of this part.

(2) A CAIR NO_X Ozone Season unit shall be subject to the requirements under paragraph (c)(1) of this section starting on the later of May 1, 2009 or the deadline for meeting the unit's monitor certification requirements under § 96.370(b)(1), (2), (3), or (7).

(3) A CAIR NO_X Ozone Season allowance shall not be deducted, for compliance with the requirements under paragraph (c)(1) of this section, for a control period in a calendar year before the year for which the CAIR NO_X Ozone Season allowance was allocated.

(4) CAIR NO_X Ozone Season allowances shall be held in, deducted from, or transferred into or among CAIR NO_X Ozone Season Allowance Tracking System accounts in accordance with subpart EEEE of this part.

(5) A CAIR NO_X Ozone Season allowance is a limited authorization to emit one ton of nitrogen oxides in accordance with the CAIR NO_X Ozone Season Trading Program. No provision of the CAIR NO_X Ozone Season Trading Program, the CAIR permit application, the CAIR permit, or an exemption under § 96.305 and no provision of law shall be construed to limit the authority of the State or the United States to terminate or limit such authorization.

(6) A CAIR NO_X Ozone Season allowance does not constitute a property right.

(7) Upon recordation by the Administrator under subpart FFFF, GGGG, or IIII of this part, every allocation, transfer, or deduction of a CAIR NO_X Ozone Season allowance to or from a CAIR NO_X Ozone Season unit's compliance account is incorporated automatically in any CAIR permit of the source that includes the CAIR NO_X Ozone Season unit.

(d) *Excess emissions requirements.* (1) If a CAIR NO_X Ozone Season source emits nitrogen oxides during any control period in excess of the CAIR NO_X Ozone Season emissions limitation, then:

(i) The owners and operators of the source and each CAIR NO_X Ozone Season unit at the source shall surrender the CAIR NO_X Ozone Season allowances required for deduction under § 96.354(d)(1) and pay any fine, penalty, or assessment or comply with any other remedy imposed, for the same violations, under the Clean Air Act or applicable State law; and

(ii) Each ton of such excess emissions and each day of such control period shall constitute a separate violation of this subpart, the Clean Air Act, and applicable State law.

(2) [Reserved]

(e) *Recordkeeping and reporting requirements.* (1) Unless otherwise provided, the owners and operators of the CAIR NO_X Ozone Season source and each CAIR NO_X Ozone Season unit at the source shall keep on site at the source each of the following documents for a period of 5 years from the date the document is created. This period may be extended for cause, at any time before the end of 5 years, in writing by the permitting authority or the Administrator.

(i) The certificate of representation under § 96.313 for the CAIR designated representative for the source and each CAIR NO_X Ozone Season unit at the source and all documents that demonstrate the truth of the statements in the certificate of representation; provided that the certificate and documents shall be retained on site at the source beyond such 5-year period until such documents are superseded because of the submission of a new certificate of representation under § 96.313 changing the CAIR designated representative.

(ii) All emissions monitoring information, in accordance with subpart HHHH of this part, provided that to the extent that subpart HHHH of this part provides for a 3-year period for recordkeeping, the 3-year period shall apply.

(iii) Copies of all reports, compliance certifications, and other submissions and all records made or required under the CAIR NO_X Ozone Season Trading Program.

(iv) Copies of all documents used to complete a CAIR permit application and any other submission under the CAIR NO_X Ozone Season Trading Program or to demonstrate compliance with the requirements of the CAIR NO_X Ozone Season Trading Program.

(2) The CAIR designated representative of a CAIR NO_X Ozone Season source and each CAIR NO_X Ozone Season unit at the source shall submit the reports required under the CAIR NO_X Ozone Season Trading Program, including those under subpart HHHH of this part.

(f) *Liability.* (1) Each CAIR NO_X Ozone Season source and each CAIR NO_X Ozone Season unit shall meet the requirements of the CAIR NO_X Ozone Season Trading Program.

(2) Any provision of the CAIR NO_X Ozone Season Trading Program that applies to a CAIR NO_X Ozone Season source or the CAIR designated representative of a CAIR NO_X Ozone Season source shall also apply to the owners and operators of such source and of the CAIR NO_X Ozone Season units at the source.

(3) Any provision of the CAIR NO_X Ozone Season Trading Program that applies to a CAIR NO_X Ozone Season unit or the CAIR designated representative of a CAIR NO_X Ozone Season unit shall also apply to the owners and operators of such unit.

(g) *Effect on other authorities.* No provision of the CAIR NO_X Ozone Season Trading Program, a CAIR permit application, a CAIR permit, or an exemption under § 96.305 shall be construed as exempting or excluding the owners and operators, and the CAIR designated representative, of a CAIR NO_X Ozone Season source or CAIR NO_X Ozone Season unit from compliance with any other provision of the applicable, approved State implementation plan, a federally enforceable permit, or the Clean Air Act.

§ 96.307 Computation of time.

(a) Unless otherwise stated, any time period scheduled, under the CAIR NO_X Ozone Season Trading Program, to begin on the occurrence of an act or event shall begin on the day the act or event occurs.

(b) Unless otherwise stated, any time period scheduled, under the CAIR NO_X Ozone Season Trading Program, to begin before the occurrence of an act or event shall be computed so that the period ends the day before the act or event occurs.

(c) Unless otherwise stated, if the final day of any time period, under the CAIR NO_X Ozone Season Trading Program, falls on a weekend or a State or Federal holiday, the time period shall be extended to the next business day.

§ 96.308 Appeal procedures.

The appeal procedures for decisions of the Administrator under the CAIR NO_X Ozone Season Trading Program are set forth in part 78 of this chapter.

NMED Exhibit 7f

Subpart BBBB—CAIR Designated Representative for CAIR NO_X Ozone Season Sources

§ 96.310 Authorization and responsibilities of CAIR designated representative.

(a) Except as provided under § 96.311, each CAIR NO_X Ozone Season source, including all CAIR NO_X Ozone Season units at the source, shall have one and only one CAIR designated representative, with regard to all matters under the CAIR NO_X Ozone Season Trading Program concerning the source or any CAIR NO_X Ozone Season unit at the source.

(b) The CAIR designated representative of the CAIR NO_X Ozone Season source shall be selected by an agreement binding on the owners and operators of the source and all CAIR NO_X Ozone Season units at the source and shall act in accordance with the certification statement in § 96.313(a)(4)(iv).

(c) Upon receipt by the Administrator of a complete certificate of representation under § 96.313, the CAIR designated representative of the source shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each owner and operator of the CAIR NO_X Ozone Season source represented and each CAIR NO_X Ozone Season unit at the source in all matters pertaining to the CAIR NO_X Ozone Season Trading Program, notwithstanding any agreement between the CAIR designated representative and such owners and operators. The owners and operators shall be bound by any decision or order issued to the CAIR designated representative by the permitting authority, the Administrator, or a court regarding the source or unit.

(d) No CAIR permit will be issued, no emissions data reports will be accepted, and no CAIR NO_X Ozone Season Allowance Tracking System account will be established for a CAIR NO_X Ozone Season unit at a source, until the Administrator has received a complete certificate of representation under § 96.313 for a CAIR designated representative of the source and the CAIR NO_X Ozone Season units at the source.

(e)(1) Each submission under the CAIR NO_X Ozone Season Trading Program shall be submitted, signed, and certified by the CAIR designated representative for each CAIR NO_X Ozone Season source on behalf of which the submission is made. Each such submission shall include the following certification statement by the CAIR designated representative: ''I am authorized to make this submission on behalf of the owners and operators of the source or units for which the submission is made. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment.''

(2) The permitting authority and the Administrator will accept or act on a submission made on behalf of owner or operators of a CAIR NO_X Ozone Season source or a CAIR NO_X Ozone Season unit only if the submission has been made, signed, and certified in accordance with paragraph (e)(1) of this section.

§ 96.311 Alternate CAIR designated representative.

(a) A certificate of representation under § 96.313 may designate one and only one alternate CAIR designated representative, who may act on behalf of the CAIR designated representative. The agreement by which the alternate CAIR designated representative is selected shall include a procedure for authorizing the alternate CAIR designated representative to act in lieu of the CAIR designated representative.

(b) Upon receipt by the Administrator of a complete certificate of representation under § 96.313, any representation, action, inaction, or submission by the alternate CAIR designated representative shall be deemed to be a representation, action, inaction, or submission by the CAIR designated representative.

(c) Except in this section and §§ 96.302, 96.310(a) and (d), 96.312, 96.313, 96.351, and 96.382 whenever the term ''CAIR designated representative'' is used in subparts AAAA through IIII of this part, the term shall be construed to include the CAIR designated representative or any alternate CAIR designated representative.

§ 96.312 Changing CAIR designated representative and alternate CAIR designated representative; changes in owners and operators.

(a) *Changing CAIR designated representative.* The CAIR designated representative may be changed at any time upon receipt by the Administrator of a superseding complete certificate of representation under § 96.313. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CAIR designated representative before the time and date when the Administrator receives the superseding certificate of representation shall be binding on the new CAIR designated representative and the owners and operators of the CAIR NO_X Ozone Season source and the CAIR NO_X Ozone Season units at the source.

(b) *Changing alternate CAIR designated representative.* The alternate CAIR designated representative may be changed at any time upon receipt by the Administrator of a superseding complete certificate of representation under § 96.313. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous alternate CAIR designated representative before the time and date when the Administrator receives the superseding certificate of representation shall be binding on the new alternate CAIR designated representative and the owners and operators of the CAIR NO_X Ozone Season source and the CAIR NO_X Ozone Season units at the source.

(c) Changes in owners and operators. (1) In the event a new owner or operator of a CAIR NO_X Ozone Season source or a CAIR NO_X Ozone Season unit is not included in the list of owners and operators in the certificate of representation under § 96.313, such new owner or operator shall be deemed to be subject to and bound by the certificate of representation, the representations, actions, inactions, and submissions of the CAIR designated representative and any alternate CAIR designated representative of the source or unit, and the decisions and orders of the permitting authority, the Administrator, or a court, as if the new owner or operator were included in such list.

(2) Within 30 days following any change in the owners and operators of a CAIR NO_X Ozone Season source or a CAIR NO_X Ozone Season unit, including the addition of a new owner or operator, the CAIR designated representative or any alternate CAIR designated representative shall submit a revision to the certificate of representation under § 96.313 amending the list of owners and operators to include the change.

§ 96.313 Certificate of representation.

(a) A complete certificate of representation for a CAIR designated representative or an alternate CAIR designated representative shall include

NMED Exhibit 7f

the following elements in a format prescribed by the Administrator:

(1) Identification of the CAIR NO_X Ozone Season source, and each CAIR NO_X Ozone Season unit at the source, for which the certificate of representation is submitted.

(2) The name, address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the CAIR designated representative and any alternate CAIR designated representative.

(3) A list of the owners and operators of the CAIR NO_X Ozone Season source and of each CAIR NO_X Ozone Season unit at the source.

(4) The following certification statements by the CAIR designated representative and any alternate CAIR designated representative—

(i) ''I certify that I was selected as the CAIR designated representative or alternate CAIR designated representative, as applicable, by an agreement binding on the owners and operators of the source and each CAIR NO_X Ozone Season unit at the source.''

(ii) ''I certify that I have all the necessary authority to carry out my duties and responsibilities under the CAIR NO_X Ozone Season Trading Program on behalf of the owners and operators of the source and of each CAIR NO_X Ozone Season unit at the source and that each such owner and operator shall be fully bound by my representations, actions, inactions, or submissions.''

(iii) ''I certify that the owners and operators of the source and of each CAIR NO_X Ozone Season unit at the source shall be bound by any order issued to me by the Administrator, the permitting authority, or a court regarding the source or unit.''

(iv) ''Where there are multiple holders of a legal or equitable title to, or a leasehold interest in, a CAIR NO_X Ozone Season unit, or where a customer purchases power from a CAIR NO_X Ozone Season unit under a life-of-the-unit, firm power contractual arrangement, I certify that: I have given a written notice of my selection as the 'CAIR designated representative' or 'alternate CAIR designated representative', as applicable, and of the agreement by which I was selected to each owner and operator of the source and of each CAIR NO_X Ozone Season unit at the source; and CAIR NO_X Ozone Season allowances and proceeds of transactions involving CAIR NO_X Ozone Season allowances will be deemed to be held or distributed in proportion to each holder's legal, equitable, leasehold, or contractual reservation or entitlement, except that, if such multiple holders have expressly provided for a different distribution of CAIR NO_X Ozone Season allowances by contract, CAIR NO_X Ozone Season allowances and proceeds of transactions involving CAIR NO_X Ozone Season allowances will be deemed to be held or distributed in accordance with the contract.''

(5) The signature of the CAIR designated representative and any alternate CAIR designated representative and the dates signed.

(b) Unless otherwise required by the permitting authority or the Administrator, documents of agreement referred to in the certificate of representation shall not be submitted to the permitting authority or the Administrator. Neither the permitting authority nor the Administrator shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

§ 96.314 Objections concerning CAIR designated representative.

(a) Once a complete certificate of representation under § 96.313 has been submitted and received, the permitting authority and the Administrator will rely on the certificate of representation unless and until a superseding complete certificate of representation under § 96.313 is received by the Administrator.

(b) Except as provided in § 96.312(a) or (b), no objection or other communication submitted to the permitting authority or the Administrator concerning the authorization, or any representation, action, inaction, or submission, of the CAIR designated representative shall affect any representation, action, inaction, or submission of the CAIR designated representative or the finality of any decision or order by the permitting authority or the Administrator under the CAIR NO_X Ozone Season Trading Program.

(c) Neither the permitting authority nor the Administrator will adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of any CAIR designated representative, including private legal disputes concerning the proceeds of CAIR NO_X Ozone Season allowance transfers.

Subpart CCCC—Permits

§ 96.320 General CAIR NO_X Ozone Season Trading Program permit requirements.

(a) For each CAIR NO_X Ozone Season source required to have a title V operating permit or required, under subpart IIII of this part, to have a title V operating permit or other federally enforceable permit, such permit shall include a CAIR permit administered by the permitting authority for the title V operating permit or the federally enforceable permit as applicable. The CAIR portion of the title V permit or other federally enforceable permit as applicable shall be administered in accordance with the permitting authority's title V operating permits regulations promulgated under part 70 or 71 of this chapter or the permitting authority's regulations for other federally enforceable permits as applicable, except as provided otherwise by this subpart and subpart IIII of this part.

(b) Each CAIR permit shall contain, with regard to the CAIR NO_X Ozone Season source and the CAIR NO_X Ozone Season units at the source covered by the CAIR permit, all applicable CAIR NO_X Ozone Season Trading Program, CAIR NO_X Annual Trading Program, and CAIR SO_2 Trading Program requirements and shall be a complete and separable portion of the title V operating permit or other federally enforceable permit under paragraph (a) of this section.

§ 96.321 Submission of CAIR permit applications.

(a) *Duty to apply.* The CAIR designated representative of any CAIR NO_X Ozone Season source required to have a title V operating permit shall submit to the permitting authority a complete CAIR permit application under § 96.322 for the source covering each CAIR NO_X Ozone Season unit at the source at least 18 months (or such lesser time provided by the permitting authority) before the later of January 1, 2009 or the date on which the CAIR NO_X Ozone Season unit commences operation.

(b) *Duty to Reapply.* For a CAIR NO_X Ozone Season source required to have a title V operating permit, the CAIR designated representative shall submit a complete CAIR permit application under § 96.322 for the source covering each CAIR NO_X Ozone Season unit at the source to renew the CAIR permit in accordance with the permitting authority's title V operating permits regulations addressing permit renewal.

§ 96.322 Information requirements for CAIR permit applications.

A complete CAIR permit application shall include the following elements concerning the CAIR NO_X Ozone Season source for which the application is submitted, in a format prescribed by the permitting authority:

(a) Identification of the CAIR NO_X Ozone Season source;

(b) Identification of each CAIR NO_X Ozone Season unit at the CAIR NO_X Ozone Season source; and

(c) The standard requirements under § 96.306.

§ 96.323 CAIR permit contents and term.

(a) Each CAIR permit will contain, in a format prescribed by the permitting authority, all elements required for a complete CAIR permit application under § 96.322.

(b) Each CAIR permit is deemed to incorporate automatically the definitions of terms under § 96.302 and, upon recordation by the Administrator under subpart FFFF, GGGG, or IIII of this part, every allocation, transfer, or deduction of a CAIR NO_X Ozone Season allowance to or from the compliance account of the CAIR NO_X Ozone Season source covered by the permit.

(c) The term of the CAIR permit will be set by the permitting authority, as necessary to facilitate coordination of the renewal of the CAIR permit with issuance, revision, or renewal of the CAIR NO_X Ozone Season source's title V operating permit or other federally enforceable permit as applicable.

§ 96.324 CAIR permit revisions.

Except as provided in § 96.323(b), the permitting authority will revise the CAIR permit, as necessary, in accordance with the permitting authority's title V operating permits regulations or the permitting authority's regulations for other federally enforceable permits as applicable addressing permit revisions.

Subpart DDDD—[Reserved]

Subpart EEEE—CAIR NO_X Ozone Season Allowance Allocations

§ 96.340 State trading budgets.

(a) Except as provided in paragraph (b) of this section, the State trading budgets for annual allocations of CAIR NO_X Ozone Season allowances for the control periods in 2009 through 2014 and in 2015 and thereafter are respectively as follows:

State	State trading budget for 2009–2014 (tons)	State trading budget for 2015 and thereafter (tons)
Alabama	32,182	26,818
Arkansas	11,515	9,596
Connecticut	2,559	2,559
Delaware	2,226	1,855
District of Columbia	112	94
Florida	47,912	39,926
Illinois	30,701	28,981
Indiana	45,952	39,273
Iowa	14,263	11,886
Kentucky	36,045	30,587
Louisiana	17,085	14,238
Maryland	12,834	10,695
Massachusetts	7,551	6,293
Michigan	28,971	24,142
Mississippi	8,714	7,262
Missouri	26,678	22,231
New Jersey	6,654	5,545
New York	20,632	17,193
North Carolina	28,392	23,660
Ohio	45,664	39,945
Pennsylvania	42,171	35,143
South Carolina	15,249	12,707
Tennessee	22,842	19,035
Virginia	15,994	13,328
West Virginia	26,859	26,525
Wisconsin	17,987	14,989

(b) If a permitting authority issues additional CAIR NO_X Ozone Season allowance allocations under § 51.123(aa)(2)(iii)(A) of this chapter, the amount in the State trading budget for a control period in a calendar year will be the sum of the amount set forth for the State and for the year in paragraph (a) of this section and the amount of additional CAIR NO_X Ozone Season allowance allocations issued under § 51.123(aa)(2)(iii)(A) of this chapter for the year.

§ 96.341 Timing requirements for CAIR NO_X Ozone Season allowance allocations.

(a) By October 31, 2006, the permitting authority will submit to the Administrator the CAIR NO_X Ozone Season allowance allocations, in a format prescribed by the Administrator and in accordance with § 96.342(a) and (b), for the control periods in 2009, 2010, 2011, 2012, 2013, and 2014.

(b)(1) By October 31, 2009 and October 31 of each year thereafter, the permitting authority will submit to the Administrator the CAIR NO_X Ozone Season allowance allocations, in a format prescribed by the Administrator and in accordance with § 96.342(a) and (b), for the control period in the sixth year after the year of the applicable deadline for submission under this paragraph.

(2) If the permitting authority fails to submit to the Administrator the CAIR NO_X Ozone Season allowance allocations in accordance with paragraph (b)(1), the Administrator will assume that the allocations of CAIR NO_X Ozone Season allowances for the applicable control period are the same as for the control period that immediately precedes the applicable control period, except that, if the applicable control period is in 2015, the Administrator will assume that the allocations equal 83 percent of the allocations for the control period that immediately precedes the applicable control period.

(c)(1) By July 31, 2009 and July 31 of each year thereafter, the permitting authority will submit to the Administrator the CAIR NO_X Ozone Season allowance allocations, in a format prescribed by the Administrator and in accordance with § 96.342(c), (a), and (d), for the control period in the year of the applicable deadline for submission under this paragraph.

(2) If the permitting authority fails to submit to the Administrator the CAIR NO_X Ozone Season allowance allocations in accordance with paragraph (c)(1) of this section, the Administrator will assume that the allocations of CAIR NO_X Ozone Season allowances for the applicable control period are the same as for the control period that immediately precedes the applicable control period, except that, if the applicable control period is in 2015, the Administrator will assume that the allocations equal 83 percent of the allocations for the control period that immediately precedes the applicable control period and except that any CAIR NO_X Ozone Season unit that would otherwise be allocated CAIR NO_X Ozone Season allowances under § 96.342(a) and (b), as well as under § 96.342(a), (c), and (d), for the applicable control period will be assumed to be allocated no CAIR NO_X Ozone Season allowances under § 96.342(a), (c), and (d) for the applicable control period.

§ 96.342 CAIR NO_X Ozone Season allowance allocations.

(a)(1) The baseline heat input (in mmBtu) used with respect to CAIR NO_X Ozone Season allowance allocations under paragraph (b) of this section for each CAIR NO_X Ozone Season unit will be:

(i) For units commencing operation before January 1, 2001 the average of the 3 highest amounts of the unit's adjusted control period heat input for 2000 through 2004, with the adjusted control period heat input for each year calculated as follows:

(A) If the unit is coal-fired during the year, the unit's control period heat input for such year is multiplied by 100 percent;

(B) If the unit is oil-fired during the year, the unit's control period heat input for such year is multiplied by 60 percent; and

(C) If the unit is not subject to paragraph (a)(1)(i)(A) or (B) of this section, the unit's control period heat input for such year is multiplied by 40 percent.

(ii) For units commencing operation on or after January 1, 2001 and operating each calendar year during a period of 5 or more consecutive calendar years, the average of the 3 highest amounts of the unit's total converted control period heat input over the first such 5 years.

(2)(i) A unit's control period heat input, and a unit's status as coal-fired or oil-fired, for a calendar year under paragraph (a)(1)(i) of this section, and a unit's total tons of NO_X emissions during a calendar year under paragraph (c)(3) of this section, will be determined in accordance with part 75 of this chapter, to the extent the unit was otherwise subject to the requirements of part 75 of this chapter for the year, or will be based on the best available data reported to the permitting authority for the unit, to the extent the unit was not otherwise subject to the requirements of part 75 of this chapter for the year.

(ii) A unit's converted control period heat input for a calendar year specified under paragraph (a)(1)(ii) of this section equals:

(A) Except as provided in paragraph (a)(2)(ii)(B) or (C) of this section, the control period gross electrical output of the generator or generators served by the unit multiplied by 7,900 Btu/kWh, if the unit is coal-fired for the year, or 6,675 Btu/kWh, if the unit is not coal-fired for the year, and divided by 1,000,000 Btu/mmBtu, provided that if a generator is served by 2 or more units, then the gross electrical output of the generator will be attributed to each unit in proportion to the unit's share of the total control period heat input of such units for the year;

(B) For a unit that is a boiler and has equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through the sequential use of energy, the total heat energy (in Btu) of the steam produced by the boiler during the control period, divided by 0.8 and by 1,000,000 Btu/mmBtu; or

(C) For a unit that is a combustion turbine and has equipment used to produce electricity and useful thermal energy for industrial, commercial, heating, or cooling purposes through the sequential use of energy, the control period gross electrical output of the enclosed device comprising the compressor, combustor, and turbine multiplied by 3,414 Btu/kWh, plus the total heat energy (in Btu) of the steam produced by any associated heat recovery steam generator during the control period divided by 0.8, and with the sum divided by 1,000,000 Btu/mmBtu.

(b)(1) For each control period in 2009 and thereafter, the permitting authority will allocate to all CAIR NO_X Ozone Season units in the State that have a baseline heat input (as determined under paragraph (a) of this section) a total amount of CAIR NO_X Ozone Season allowances equal to 95 percent for a control period during 2009 through 2014, and 97 percent for a control period during 2015 and thereafter, of the tons of NO_X emissions in the State trading budget under § 96.340 (except as provided in paragraph (d) of this section).

(2) The permitting authority will allocate CAIR NO_X Ozone Season allowances to each CAIR NO_X Ozone Season unit under paragraph (b)(1) of this section in an amount determined by multiplying the total amount of CAIR NO_X Ozone Season allowances allocated under paragraph (b)(1) of this section by the ratio of the baseline heat input of such CAIR NO_X Ozone Season unit to the total amount of baseline heat input of all such CAIR NO_X Ozone Season units in the State and rounding to the nearest whole allowance as appropriate.

(c) For each control period in 2009 and thereafter, the permitting authority will allocate CAIR NO_X Ozone Season allowances to CAIR NO_X Ozone Season units in the State that commenced operation on or after January 1, 2001 and do not yet have a baseline heat input (as determined under paragraph (a) of this section), in accordance with the following procedures:

(1) The permitting authority will establish a separate new unit set-aside for each control period. Each new unit set-aside will be allocated CAIR NO_X Ozone Season allowances equal to 5 percent for a control period in 2009 through 2013, and 3 percent for a control period in 2014 and thereafter, of the amount of tons of NO_X emissions in the State trading budget under § 96.340.

(2) The CAIR designated representative of such a CAIR NO_X Ozone Season unit may submit to the permitting authority a request, in a format specified by the permitting authority, to be allocated CAIR NO_X Ozone Season allowances, starting with the later of the control period in 2009 or the first control period after the control period in which the CAIR NO_X Ozone Season unit commences commercial operation and until the first control period for which the unit is allocated CAIR NO_X Ozone Season allowances under paragraph (b) of this section. The CAIR NO_X Ozone Season allowance allocation request must be submitted on or before April 1 before the first control period for which the CAIR NO_X Ozone Season allowances are requested and after the date on which the CAIR NO_X Ozone Season unit commences commercial operation.

(3) In a CAIR NO_X Ozone Season allowance allocation request under paragraph (c)(2) of this section, the CAIR designated representative may request for a control period CAIR NO_X Ozone Season allowances in an amount not exceeding the CAIR NO_X Ozone Season unit's total tons of NO_X emissions during the control period immediately before such control period.

NMED Exhibit 7f

(4) The permitting authority will review each CAIR NO_X Ozone Season allowance allocation request under paragraph (c)(2) of this section and will allocate CAIR NO_X Ozone Season allowances for each control period pursuant to such request as follows:

(i) The permitting authority will accept an allowance allocation request only if the request meets, or is adjusted by the permitting authority as necessary to meet, the requirements of paragraphs (c)(2) and (3) of this section.

(ii) On or after April 1 before the control period, the permitting authority will determine the sum of the CAIR NO_X Ozone Season allowances requested (as adjusted under paragraph (c)(4)(i) of this section) in all allowance allocation requests accepted under paragraph (c)(4)(i) of this section for the control period.

(iii) If the amount of CAIR NO_X Ozone Season allowances in the new unit set-aside for the control period is greater than or equal to the sum under paragraph (c)(4)(ii) of this section, then the permitting authority will allocate the amount of CAIR NO_X Ozone Season allowances requested (as adjusted under paragraph (c)(4)(i) of this section) to each CAIR NO_X Ozone Season unit covered by an allowance allocation request accepted under paragraph (c)(4)(i) of this section.

(iv) If the amount of CAIR NO_X Ozone Season allowances in the new unit set-aside for the control period is less than the sum under paragraph (c)(4)(ii) of this section, then the permitting authority will allocate to each CAIR NO_X Ozone Season unit covered by an allowance allocation request accepted under paragraph (c)(4)(i) of this section the amount of the CAIR NO_X Ozone Season allowances requested (as adjusted under paragraph (c)(4)(i) of this section), multiplied by the amount of CAIR NO_X Ozone Season allowances in the new unit set-aside for the control period, divided by the sum determined under paragraph (c)(4)(ii) of this section, and rounded to the nearest whole allowance as appropriate.

(v) The permitting authority will notify each CAIR designated representative that submitted an allowance allocation request of the amount of CAIR NO_X Ozone Season allowances (if any) allocated for the control period to the CAIR NO_X Ozone Season unit covered by the request.

(d) If, after completion of the procedures under paragraph (c)(4) of this section for a control period, any unallocated CAIR NO_X Ozone Season allowances remain in the new unit set-aside for the control period, the permitting authority will allocate to each CAIR NO_X Ozone Season unit that was allocated CAIR NO_X Ozone Season allowances under paragraph (b) of this section an amount of CAIR NO_X Ozone Season allowances equal to the total amount of such remaining unallocated CAIR NO_X Ozone Season allowances, multiplied by the unit's allocation under paragraph (b) of this section, divided by 95 percent for a control period during 2009 through 2014, and 97 percent for a control period during 2015 and thereafter, of the amount of tons of NO_X emissions in the State trading budget under § 96.340, and rounded to the nearest whole allowance as appropriate.

Subpart FFFF—CAIR NO_X Ozone Season Allowance Tracking System

§ 96.350 [Reserved]

§ 96.351 Establishment of accounts.

(a) *Compliance accounts.* Except as provided in § 96.384(e), upon receipt of a complete certificate of representation under § 96.313, the Administrator will establish a compliance account for the CAIR NO_X Ozone Season source for which the certificate of representation was submitted, unless the source already has a compliance account.

(b) General accounts—(1) *Application for general account.*

(i) Any person may apply to open a general account for the purpose of holding and transferring CAIR NO_X Ozone Season allowances. An application for a general account may designate one and only one CAIR authorized account representative and one and only one alternate CAIR authorized account representative who may act on behalf of the CAIR authorized account representative. The agreement by which the alternate CAIR authorized account representative is selected shall include a procedure for authorizing the alternate CAIR authorized account representative to act in lieu of the CAIR authorized account representative.

(ii) A complete application for a general account shall be submitted to the Administrator and shall include the following elements in a format prescribed by the Administrator:

(A) Name, mailing address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the CAIR authorized account representative and any alternate CAIR authorized account representative;

(B) Organization name and type of organization, if applicable;

(C) A list of all persons subject to a binding agreement for the CAIR authorized account representative and any alternate CAIR authorized account representative to represent their ownership interest with respect to the CAIR NO_X Ozone Season allowances held in the general account;

(D) The following certification statement by the CAIR authorized account representative and any alternate CAIR authorized account representative: ''I certify that I was selected as the CAIR authorized account representative or the alternate CAIR authorized account representative, as applicable, by an agreement that is binding on all persons who have an ownership interest with respect to CAIR NO_X Ozone Season allowances held in the general account. I certify that I have all the necessary authority to carry out my duties and responsibilities under the CAIR NO_X Ozone Season Trading Program on behalf of such persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the Administrator or a court regarding the general account.''

(E) The signature of the CAIR authorized account representative and any alternate CAIR authorized account representative and the dates signed.

(iii) Unless otherwise required by the permitting authority or the Administrator, documents of agreement referred to in the application for a general account shall not be submitted to the permitting authority or the Administrator. Neither the permitting authority nor the Administrator shall be under any obligation to review or evaluate the sufficiency of such documents, if submitted.

(2) Authorization of CAIR authorized account representative.

(i) Upon receipt by the Administrator of a complete application for a general account under paragraph (b)(1) of this section:

(A) The Administrator will establish a general account for the person or persons for whom the application is submitted.

(B) The CAIR authorized account representative and any alternate CAIR authorized account representative for the general account shall represent and, by his or her representations, actions, inactions, or submissions, legally bind each person who has an ownership interest with respect to CAIR NO_X Ozone Season allowances held in the general account in all matters pertaining to the CAIR NO_X Ozone Season Trading Program, notwithstanding any agreement between the CAIR authorized account representative or any alternate CAIR authorized account representative and such person. Any such person shall

NMED Exhibit 7f

be bound by any order or decision issued to the CAIR authorized account representative or any alternate CAIR authorized account representative by the Administrator or a court regarding the general account.

(C) Any representation, action, inaction, or submission by any alternate CAIR authorized account representative shall be deemed to be a representation, action, inaction, or submission by the CAIR authorized account representative.

(ii) Each submission concerning the general account shall be submitted, signed, and certified by the CAIR authorized account representative or any alternate CAIR authorized account representative for the persons having an ownership interest with respect to CAIR NO_X Ozone Season allowances held in the general account. Each such submission shall include the following certification statement by the CAIR authorized account representative or any alternate CAIR authorized account representative: ''I am authorized to make this submission on behalf of the persons having an ownership interest with respect to the CAIR NO_X Ozone Season allowances held in the general account. I certify under penalty of law that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment.''

(iii) The Administrator will accept or act on a submission concerning the general account only if the submission has been made, signed, and certified in accordance with paragraph (b)(2)(ii) of this section.

(3) Changing CAIR authorized account representative and alternate CAIR authorized account representative; changes in persons with ownership interest.

(i) The CAIR authorized account representative for a general account may be changed at any time upon receipt by the Administrator of a superseding complete application for a general account under paragraph (b)(1) of this section. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous CAIR authorized account representative before the time and date when the Administrator receives the superseding application for a general account shall be binding on the new CAIR authorized account representative and the persons with an ownership interest with respect to the CAIR NO_X Ozone Season allowances in the general account.

(ii) The alternate CAIR authorized account representative for a general account may be changed at any time upon receipt by the Administrator of a superseding complete application for a general account under paragraph (b)(1) of this section. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous alternate CAIR authorized account representative before the time and date when the Administrator receives the superseding application for a general account shall be binding on the new alternate CAIR authorized account representative and the persons with an ownership interest with respect to the CAIR NO_X Ozone Season allowances in the general account.

(iii)(A) In the event a new person having an ownership interest with respect to CAIR NO_X Ozone Season allowances in the general account is not included in the list of such persons in the application for a general account, such new person shall be deemed to be subject to and bound by the application for a general account, the representation, actions, inactions, and submissions of the CAIR authorized account representative and any alternate CAIR authorized account representative of the account, and the decisions and orders of the Administrator or a court, as if the new person were included in such list.

(B) Within 30 days following any change in the persons having an ownership interest with respect to CAIR NO_X Ozone Season allowances in the general account, including the addition of persons, the CAIR authorized account representative or any alternate CAIR authorized account representative shall submit a revision to the application for a general account amending the list of persons having an ownership interest with respect to the CAIR NO_X Ozone Season allowances in the general account to include the change.

(4) Objections concerning CAIR authorized account representative.

(i) Once a complete application for a general account under paragraph (b)(1) of this section has been submitted and received, the Administrator will rely on the application unless and until a superseding complete application for a general account under paragraph (b)(1) of this section is received by the Administrator.

(ii) Except as provided in paragraph (b)(3)(i) or (ii) of this section, no objection or other communication submitted to the Administrator concerning the authorization, or any representation, action, inaction, or submission of the CAIR authorized account representative or any alternative CAIR authorized account representative for a general account shall affect any representation, action, inaction, or submission of the CAIR authorized account representative or any alternative CAIR authorized account representative or the finality of any decision or order by the Administrator under the CAIR NO_X Ozone Season Trading Program.

(iii) The Administrator will not adjudicate any private legal dispute concerning the authorization or any representation, action, inaction, or submission of the CAIR authorized account representative or any alternative CAIR authorized account representative for a general account, including private legal disputes concerning the proceeds of CAIR NO_X Ozone Season allowance transfers.

(c) *Account identification.* The Administrator will assign a unique identifying number to each account established under paragraph (a) or (b) of this section.

§ 96.352 Responsibilities of CAIR authorized account representative.

Following the establishment of a CAIR NO_X Ozone Season Allowance Tracking System account, all submissions to the Administrator pertaining to the account, including, but not limited to, submissions concerning the deduction or transfer of CAIR NO_X Ozone Season allowances in the account, shall be made only by the CAIR authorized account representative for the account.

§ 96.353 Recordation of CAIR NO_X Ozone Season allowance allocations.

(a) By December 1, 2006, the Administrator will record in the CAIR NO_X Ozone Season source's compliance account the CAIR NO_X Ozone Season allowances allocated for the CAIR NO_X Ozone Season units at a source, as submitted by the permitting authority in accordance with § 96.341(a), for the control periods in 2009, 2010, 2011, 2012, 2013, and 2014.

(b) By December 1, 2009, the Administrator will record in the CAIR NO_X Ozone Season source's compliance account the CAIR NO_X Ozone Season allowances allocated for the CAIR NO_X Ozone Season units at the source, as submitted by the permitting authority or as determined by the Administrator in

NMED Exhibit 7f

accordance with § 96.341(b), for the control period in 2015.

(c) In 2011 and each year thereafter, after the Administrator has made all deductions (if any) from a CAIR NO_X Ozone Season source's compliance account under § 96.354, the Administrator will record in the CAIR NO_X Ozone Season source's compliance account the CAIR NO_X Ozone Season allowances allocated for the CAIR NO_X Ozone Season units at the source, as submitted by the permitting authority or determined by the Administrator in accordance with § 96.341(b), for the control period in the sixth year after the year of the control period for which such deductions were or could have been made.

(d) By September 1, 2009 and September 1 of each year thereafter, the Administrator will record in the CAIR NO_X Ozone Season source's compliance account the CAIR NO_X Ozone Season allowances allocated for the CAIR NO_X Ozone Season units at the source, as submitted by the permitting authority or determined by the Administrator in accordance with § 96.341(c), for the control period in the year of the applicable deadline for recordation under this paragraph.

(e) *Serial numbers for allocated CAIR NO_X Ozone Season allowances.* When recording the allocation of CAIR NO_X Ozone Season allowances for a CAIR NO_X Ozone Season unit in a compliance account, the Administrator will assign each CAIR NO_X Ozone Season allowance a unique identification number that will include digits identifying the year of the control period for which the CAIR NO_X Ozone Season allowance is allocated.

§ 96.354 Compliance with CAIR NO_X emissions limitation.

(a) *Allowance transfer deadline.* The CAIR NO_X Ozone Season allowances are available to be deducted for compliance with a source's CAIR NO_X Ozone Season emissions limitation for a control period in a given calendar year only if the CAIR NO_X Ozone Season allowances:

(1) Were allocated for the control period in the year or a prior year;

(2) Are held in the compliance account as of the allowance transfer deadline for the control period or are transferred into the compliance account by a CAIR NO_X Ozone Season allowance transfer correctly submitted for recordation under § 96.360 by the allowance transfer deadline for the control period; and

(3) Are not necessary for deductions for excess emissions for a prior control period under paragraph (d) of this section.

(b) *Deductions for compliance.* Following the recordation, in accordance with § 96.361, of CAIR NO_X Ozone Season allowance transfers submitted for recordation in a source's compliance account by the allowance transfer deadline for a control period, the Administrator will deduct from the compliance account CAIR NO_X Ozone Season allowances available under paragraph (a) of this section in order to determine whether the source meets the CAIR NO_X Ozone Season emissions limitation for the control period, as follows:

(1) Until the amount of CAIR NO_X Ozone Season allowances deducted equals the number of tons of total nitrogen oxides emissions, determined in accordance with subpart HHHH of this part, from all CAIR NO_X Ozone Season units at the source for the control period; or

(2) If there are insufficient CAIR NO_X Ozone Season allowances to complete the deductions in paragraph (b)(1) of this section, until no more CAIR NO_X Ozone Season allowances available under paragraph (a) of this section remain in the compliance account.

(c)(1) *Identification of CAIR NO_X Ozone Season allowances by serial number.* The CAIR authorized account representative for a source's compliance account may request that specific CAIR NO_X Ozone Season allowances, identified by serial number, in the compliance account be deducted for emissions or excess emissions for a control period in accordance with paragraph (b) or (d) of this section. Such request shall be submitted to the Administrator by the allowance transfer deadline for the control period and include, in a format prescribed by the Administrator, the identification of the CAIR NO_X Ozone Season source and the appropriate serial numbers.

(2) *First-in, first-out.* The Administrator will deduct CAIR NO_X Ozone Season allowances under paragraph (b) or (d) of this section from the source's compliance account, in the absence of an identification or in the case of a partial identification of CAIR NO_X Ozone Season allowances by serial number under paragraph (c)(1) of this section, on a first-in, first-out (FIFO) accounting basis in the following order:

(i) Any CAIR NO_X Ozone Season allowances that were allocated to the units at the source, in the order of recordation; and then

(ii) Any CAIR NO_X Ozone Season allowances that were allocated to any unit and transferred and recorded in the compliance account pursuant to subpart GGGG of this part, in the order of recordation.

(d) *Deductions for excess emissions.* (1) After making the deductions for compliance under paragraph (b) of this section for a control period in a calendar year in which the CAIR NO_X Ozone Season source has excess emissions, the Administrator will deduct from the source's compliance account an amount of CAIR NO_X Ozone Season allowances, allocated for the control period in the immediately following calendar year, equal to 3 times the number of tons of the source's excess emissions.

(2) Any allowance deduction required under paragraph (d)(1) of this section shall not affect the liability of the owners and operators of the CAIR NO_X Ozone Season source or the CAIR NO_X Ozone Season units at the source for any fine, penalty, or assessment, or their obligation to comply with any other remedy, for the same violations, as ordered under the Clean Air Act or applicable State law.

(e) *Recordation of deductions.* The Administrator will record in the appropriate compliance account all deductions from such an account under paragraph (b) or (d) of this section.

(f) *Administrator's action on submissions.* (1) The Administrator may review and conduct independent audits concerning any submission under the CAIR NO_X Ozone Season Trading Program and make appropriate adjustments of the information in the submissions.

(2) The Administrator may deduct CAIR NO_X Ozone Season allowances from or transfer CAIR NO_X Ozone Season allowances to a source's compliance account based on the information in the submissions, as adjusted under paragraph (f)(1) of this section.

§ 96.355 Banking.

(a) CAIR NO_X Ozone Season allowances may be banked for future use or transfer in a compliance account or a general account in accordance with paragraph (b) of this section.

(b) Any CAIR NO_X Ozone Season allowance that is held in a compliance account or a general account will remain in such account unless and until the CAIR NO_X Ozone Season allowance is deducted or transferred under § 96.354, § 96.356, or subpart GG of this part.

§ 96.356 Account error.

The Administrator may, at his or her sole discretion and on his or her own motion, correct any error in any CAIR NO_X Ozone Season Allowance Tracking System account. Within 10 business

NMED Exhibit 7f

days of making such correction, the Administrator will notify the CAIR authorized account representative for the account.

§ 96.357 Closing of general accounts.

(a) The CAIR authorized account representative of a general account may submit to the Administrator a request to close the account, which shall include a correctly submitted allowance transfer under § 96.360 for any CAIR NO_X Ozone Season allowances in the account to one or more other CAIR NO_X Ozone Season Allowance Tracking System accounts.

(b) If a general account has no allowance transfers in or out of the account for a 12-month period or longer and does not contain any CAIR NO_X Ozone Season allowances, the Administrator may notify the CAIR authorized account representative for the account that the account will be closed following 20 business days after the notice is sent. The account will be closed after the 20-day period unless, before the end of the 20-day period, the Administrator receives a correctly submitted transfer of CAIR NO_X Ozone Season allowances into the account under § 96.360 or a statement submitted by the CAIR authorized account representative demonstrating to the satisfaction of the Administrator good cause as to why the account should not be closed.

Subpart GGGG—CAIR NO_X Ozone Season Allowance Transfers

§ 96.360 Submission of CAIR NO_X Ozone Season allowance transfers.

A CAIR authorized account representative seeking recordation of a CAIR NO_X Ozone Season allowance transfer shall submit the transfer to the Administrator. To be considered correctly submitted, the CAIR NO_X Ozone Season allowance transfer shall include the following elements, in a format specified by the Administrator:

(a) The account numbers for both the transferor and transferee accounts;

(b) The serial number of each CAIR NO_X Ozone Season allowance that is in the transferor account and is to be transferred; and

(c) The name and signature of the CAIR authorized account representative of the transferor account and the date signed.

§ 96.361 EPA recordation.

(a) Within 5 business days (except as provided in paragraph (b) of this section) of receiving a CAIR NO_X Ozone Season allowance transfer, the Administrator will record a CAIR NO_X Ozone Season allowance transfer by moving each CAIR NO_X Ozone Season allowance from the transferor account to the transferee account as specified by the request, provided that:

(1) The transfer is correctly submitted under § 96.360; and

(2) The transferor account includes each CAIR NO_X Ozone Season allowance identified by serial number in the transfer.

(b) A CAIR NO_X Ozone Season allowance transfer that is submitted for recordation after the allowance transfer deadline for a control period and that includes any CAIR NO_X Ozone Season allowances allocated for any control period before such allowance transfer deadline will not be recorded until after the Administrator completes the deductions under § 96.354 for the control period immediately before such allowance transfer deadline.

(c) Where a CAIR NO_X Ozone Season allowance transfer submitted for recordation fails to meet the requirements of paragraph (a) of this section, the Administrator will not record such transfer.

§ 96.362 Notification.

(a) *Notification of recordation.* Within 5 business days of recordation of a CAIR NO_X Ozone Season allowance transfer under § 96.361, the Administrator will notify the CAIR authorized account representatives of both the transferor and transferee accounts.

(b) *Notification of non-recordation.* Within 10 business days of receipt of a CAIR NO_X Ozone Season allowance transfer that fails to meet the requirements of § 96.361(a), the Administrator will notify the CAIR authorized account representatives of both accounts subject to the transfer of:

(1) A decision not to record the transfer, and

(2) The reasons for such non-recordation.

(c) Nothing in this section shall preclude the submission of a CAIR NO_X Ozone Season allowance transfer for recordation following notification of non-recordation.

Subpart HHHH—Monitoring and Reporting

§ 96.370 General requirements.

The owners and operators, and to the extent applicable, the CAIR designated representative, of a CAIR NO_X Ozone Season unit, shall comply with the monitoring, recordkeeping, and reporting requirements as provided in this subpart and in subpart H of part 75 of this chapter. For purposes of complying with such requirements, the definitions in § 96.302 and in § 72.2 of this chapter shall apply, and the terms ''affected unit,'' ''designated representative,'' and ''continuous emission monitoring system'' (or ''CEMS'') in part 75 of this chapter shall be deemed to refer to the terms ''CAIR NO_X Ozone Season unit,'' ''CAIR designated representative,'' and ''continuous emission monitoring system'' (or ''CEMS'') respectively, as defined in § 96.302. The owner or operator of a unit that is not a CAIR NO_X Ozone Season unit but that is monitored under § 75.72(b)(2)(ii) of this chapter shall comply with the same monitoring, recordkeeping, and reporting requirements as a CAIR NO_X Ozone Season unit.

(a) *Requirements for installation, certification, and data accounting.* The owner or operator of each CAIR NO_X Ozone Season unit shall:

(1) Install all monitoring systems required under this subpart for monitoring NO_X mass emissions and individual unit heat input (including all systems required to monitor NO_X emission rate, NO_X concentration, stack gas moisture content, stack gas flow rate, CO_2 or O_2 concentration, and fuel flow rate, as applicable, in accordance with §§ 75.71 and 75.72 of this chapter);

(2) Successfully complete all certification tests required under § 96.371 and meet all other requirements of this subpart and part 75 of this chapter applicable to the monitoring systems under paragraph (a)(1) of this section; and

(3) Record, report, and quality-assure the data from the monitoring systems under paragraph (a)(1) of this section.

(b) *Compliance deadlines.* The owner or operator shall meet the monitoring system certification and other requirements of paragraphs (a)(1) and (2) of this section on or before the following dates. The owner or operator shall record, report, and quality-assure the data from the monitoring systems under paragraph (a)(1) of this section on and after the following dates.

(1) For the owner or operator of a CAIR NO_X Ozone Season unit that commences commercial operation before July 1, 2007, by May 1, 2008.

(2) For the owner or operator of a CAIR NO_X Ozone Season unit that commences commercial operation on or after July 1, 2007 and that reports on an annual basis under § 96.374(d), by the later of the following dates:

(i) 90 unit operating days or 180 calendar days, whichever occurs first, after the date on which the unit commences commercial operation; or

(ii) May 1, 2008, if the compliance date under paragraph (b)(2)(i) is before May 1, 2008.

NMED Exhibit 7f

(3) For the owner or operator of a CAIR NO_X Ozone Season unit that commences operation on or after July 1, 2007 and that reports on a control period basis under § 96.374(d)(2)(ii), by the later of the following dates:

(i) 90 unit operating days or 180 calendar days, whichever occurs first, after the date on which the unit commences commercial operation; or

(ii) If the compliance date under paragraph (b)(3)(i) of this section is not during a control period, May 1 immediately following the compliance date under paragraph (b)(3)(i) of this section.

(4) For the owner or operator of a CAIR NO_X Ozone Season unit for which construction of a new stack or flue or installation of add-on NO_X emission controls is completed after the applicable deadline under paragraph (b)(1), (2), (6), or (7) of this section and that reports on an annual basis under § 96.374(d), by 90 unit operating days or 180 calendar days, whichever occurs first, after the date on which emissions first exit to the atmosphere through the new stack or flue or add-on NO_X emissions controls.

(5) For the owner or operator of a CAIR NO_X Ozone Season unit for which construction of a new stack or flue or installation of add-on NO_X emission controls is completed after the applicable deadline under paragraph (b)(1), (3), (6), or (7) of this section and that reports on a control period basis under § 96.374(d)(2)(ii), by the later of the following dates:

(i) 90 unit operating days or 180 calendar days, whichever occurs first, after the date on which emissions first exit to the atmosphere through the new stack or flue or add-on NO_X emissions controls; or

(ii) If the compliance date under paragraph (b)(5)(i) of this section is not during a control period, May 1 immediately following the compliance date under paragraph (b)(5)(i) of this section.

(6) Notwithstanding the dates in paragraphs (b)(1), (2), and (3) of this section, for the owner or operator of a unit for which a CAIR NO_X Ozone Season opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart IIII of this part, by the date specified in § 96.384(b).

(7) Notwithstanding the dates in paragraphs (b)(1), (2), and (3) of this section and solely for purposes of § 96.306(c)(2), for the owner or operator of a CAIR NO_X Ozone Season opt-in unit, by the date on which the CAIR NO_X Ozone Season opt-in unit enters the CAIR NO_X Ozone Season Trading Program as provided in § 96.384(g).

(c) *Reporting data.* (1) Except as provided in paragraph (c)(2) of this section, the owner or operator of a CAIR NO_X Ozone Season unit that does not meet the applicable compliance date set forth in paragraph (b) of this section for any monitoring system under paragraph (a)(1) of this section shall, for each such monitoring system, determine, record, and report maximum potential (or, as appropriate, minimum potential) values for NO_X concentration, NO_X emission rate, stack gas flow rate, stack gas moisture content, fuel flow rate, and any other parameters required to determine NO_X mass emissions and heat input in accordance with § 75.31(b)(2) or (c)(3) of this chapter, section 2.4 of appendix D to part 75 of this chapter, or section 2.5 of appendix E to part 75 of this chapter, as applicable.

(2) The owner or operator of a CAIR NO_X unit that does not meet the applicable compliance date set forth in paragraph (b)(4) of this section for any monitoring system under paragraph (a)(1) of this section shall, for each such monitoring system, determine, record, and report substitute data using the applicable missing data procedures in § 75.74(c)(7) of this chapter or subpart D or subpart H of, or appendix D or appendix E to, part 75 of this chapter, in lieu of the maximum potential (or, as appropriate, minimum potential) values, for a parameter if the owner or operator demonstrates that there is continuity between the data streams for that parameter before and after the construction or installation under paragraph (b)(4) of this section.

(d) *Prohibitions.* (1) No owner or operator of a CAIR NO_X Ozone Season unit shall use any alternative monitoring system, alternative reference method, or any other alternative to any requirement of this subpart without having obtained prior written approval in accordance with § 96.375.

(2) No owner or operator of a CAIR NO_X Ozone Season unit shall operate the unit so as to discharge, or allow to be discharged, NO_X emissions to the atmosphere without accounting for all such emissions in accordance with the applicable provisions of this subpart and part 75 of this chapter.

(3) No owner or operator of a CAIR NO_X Ozone Season unit shall disrupt the continuous emission monitoring system, any portion thereof, or any other approved emission monitoring method, and thereby avoid monitoring and recording NO_X mass emissions discharged into the atmosphere, except for periods of recertification or periods when calibration, quality assurance testing, or maintenance is performed in accordance with the applicable provisions of this subpart and part 75 of this chapter.

(4) No owner or operator of a CAIR NO_X Ozone Season unit shall retire or permanently discontinue use of the continuous emission monitoring system, any component thereof, or any other approved monitoring system under this subpart, except under any one of the following circumstances:

(i) During the period that the unit is covered by an exemption under § 96.305 that is in effect;

(ii) The owner or operator is monitoring emissions from the unit with another certified monitoring system approved, in accordance with the applicable provisions of this subpart and part 75 of this chapter, by the permitting authority for use at that unit that provides emission data for the same pollutant or parameter as the retired or discontinued monitoring system; or

(iii) The CAIR designated representative submits notification of the date of certification testing of a replacement monitoring system for the retired or discontinued monitoring system in accordance with § 96.371(d)(3)(i).

§ 96.371 Initial certification and recertification procedures.

(a) The owner or operator of a CAIR NO_X Ozone Season unit shall be exempt from the initial certification requirements of this section for a monitoring system under § 96.370(a)(1) if the following conditions are met:

(1) The monitoring system has been previously certified in accordance with part 75 of this chapter; and

(2) The applicable quality-assurance and quality-control requirements of § 75.21 of this chapter and appendix B, appendix D, and appendix E to part 75 of this chapter are fully met for the certified monitoring system described in paragraph (a)(1) of this section.

(b) The recertification provisions of this section shall apply to a monitoring system under § 96.370(a)(1) exempt from initial certification requirements under paragraph (a) of this section.

(c) If the Administrator has previously approved a petition under § 75.17(a) or (b) of this chapter for apportioning the NO_X emission rate measured in a common stack or a petition under § 75.66 of this chapter for an alternative to a requirement in § 75.12, § 75.17, or subpart H of part 75 of this chapter, the CAIR designated representative shall resubmit the petition to the Administrator under § 96.375(a) to determine whether the approval applies

NMED Exhibit 7f

under the CAIR NO_X Ozone Season Trading Program.

(d) Except as provided in paragraph (a) of this section, the owner or operator of a CAIR NO_X Ozone Season unit shall comply with the following initial certification and recertification procedures for a continuous monitoring system (i.e., a continuous emission monitoring system and an excepted monitoring system under appendices D and E to part 75 of this chapter) under § 96.370(a)(1). The owner or operator of a unit that qualifies to use the low mass emissions excepted monitoring methodology under § 75.19 of this chapter or that qualifies to use an alternative monitoring system under subpart E of part 75 of this chapter shall comply with the procedures in paragraph (e) or (f) of this section respectively.

(1) *Requirements for initial certification.* The owner or operator shall ensure that each continuous monitoring system under § 96.370(a)(1)(including the automated data acquisition and handling system) successfully completes all of the initial certification testing required under § 75.20 of this chapter by the applicable deadline in § 96.370(b). In addition, whenever the owner or operator installs a monitoring system to meet the requirements of this subpart in a location where no such monitoring system was previously installed, initial certification in accordance with § 75.20 of this chapter is required.

(2) Requirements for recertification. Whenever the owner or operator makes a replacement, modification, or change in any certified continuous emission monitoring system under § 96.370(a)(1) that may significantly affect the ability of the system to accurately measure or record NO_X mass emissions or heat input rate or to meet the quality-assurance and quality-control requirements of § 75.21 of this chapter or appendix B to part 75 of this chapter, the owner or operator shall recertify the monitoring system in accordance with § 75.20(b) of this chapter. Furthermore, whenever the owner or operator makes a replacement, modification, or change to the flue gas handling system or the unit's operation that may significantly change the stack flow or concentration profile, the owner or operator shall recertify each continuous emission monitoring system whose accuracy is potentially affected by the change, in accordance with § 75.20(b) of this chapter. Examples of changes to a continuous emission monitoring system that require recertification include: Replacement of the analyzer, complete replacement of an existing continuous emission monitoring system, or change in location or orientation of the sampling probe or site. Any fuel flowmeter systems, and any excepted NO_X monitoring system under appendix E to part 75 of this chapter, under § 96.370(a)(1) are subject to the recertification requirements in § 75.20(g)(6) of this chapter.

(3) *Approval process for initial certification and recertification.* Paragraphs (d)(3)(i) through (iv) of this section apply to both initial certification and recertification of a continuous monitoring system under § 96.370(a)(1). For recertifications, replace the words "certification" and "initial certification" with the word "recertification", replace the word "certified" with the word "recertified," and follow the procedures in §§ 75.20(b)(5) and (g)(7) of this chapter in lieu of the procedures in paragraph (d)(3)(v) of this section.

(i) *Notification of certification.* The CAIR designated representative shall submit to the permitting authority, the appropriate EPA Regional Office, and the Administrator written notice of the dates of certification testing, in accordance with § 96.373.

(ii) *Certification application.* The CAIR designated representative shall submit to the permitting authority a certification application for each monitoring system. A complete certification application shall include the information specified in § 75.63 of this chapter.

(iii) *Provisional certification date.* The provisional certification date for a monitoring system shall be determined in accordance with § 75.20(a)(3) of this chapter. A provisionally certified monitoring system may be used under the CAIR NO_X Ozone Season Trading Program for a period not to exceed 120 days after receipt by the permitting authority of the complete certification application for the monitoring system under paragraph (d)(3)(ii) of this section. Data measured and recorded by the provisionally certified monitoring system, in accordance with the requirements of part 75 of this chapter, will be considered valid quality-assured data (retroactive to the date and time of provisional certification), provided that the permitting authority does not invalidate the provisional certification by issuing a notice of disapproval within 120 days of the date of receipt of the complete certification application by the permitting authority.

(iv) Certification application approval process. The permitting authority will issue a written notice of approval or disapproval of the certification application to the owner or operator within 120 days of receipt of the complete certification application under paragraph (d)(3)(ii) of this section. In the event the permitting authority does not issue such a notice within such 120-day period, each monitoring system that meets the applicable performance requirements of part 75 of this chapter and is included in the certification application will be deemed certified for use under the CAIR NO_X Ozone Season Trading Program.

(A) *Approval notice.* If the certification application is complete and shows that each monitoring system meets the applicable performance requirements of part 75 of this chapter, then the permitting authority will issue a written notice of approval of the certification application within 120 days of receipt.

(B) *Incomplete application notice.* If the certification application is not complete, then the permitting authority will issue a written notice of incompleteness that sets a reasonable date by which the CAIR designated representative must submit the additional information required to complete the certification application. If the CAIR designated representative does not comply with the notice of incompleteness by the specified date, then the permitting authority may issue a notice of disapproval under paragraph (d)(3)(iv)(C) of this section. The 120-day review period shall not begin before receipt of a complete certification application.

(C) *Disapproval notice.* If the certification application shows that any monitoring system does not meet the performance requirements of part 75 of this chapter or if the certification application is incomplete and the requirement for disapproval under paragraph (d)(3)(iv)(B) of this section is met, then the permitting authority will issue a written notice of disapproval of the certification application. Upon issuance of such notice of disapproval, the provisional certification is invalidated by the permitting authority and the data measured and recorded by each uncertified monitoring system shall not be considered valid quality-assured data beginning with the date and hour of provisional certification (as defined under § 75.20(a)(3) of this chapter). The owner or operator shall follow the procedures for loss of certification in paragraph (d)(3)(v) of this section for each monitoring system that is disapproved for initial certification.

(D) *Audit decertification.* The permitting authority or, for a CAIR NO_X Ozone Season opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a

NMED Exhibit 7f

CAIR opt-in permit is not yet issued or denied under subpart IIII of this part, the Administrator may issue a notice of disapproval of the certification status of a monitor in accordance with § 96.372(b).

(v) *Procedures for loss of certification.* If the permitting authority or the Administrator issues a notice of disapproval of a certification application under paragraph (d)(3)(iv)(C) of this section or a notice of disapproval of certification status under paragraph (d)(3)(iv)(D) of this section, then:

(A) The owner or operator shall substitute the following values, for each disapproved monitoring system, for each hour of unit operation during the period of invalid data specified under § 75.20(a)(4)(iii), § 75.20(g)(7), or § 75.21(e) of this chapter and continuing until the applicable date and hour specified under § 75.20(a)(5)(i) or (g)(7) of this chapter:

(*1*) For a disapproved NO_X emission rate (*i.e.*, NO_X-diluent) system, the maximum potential NO_X emission rate, as defined in § 72.2 of this chapter.

(*2*) For a disapproved NO_X pollutant concentration monitor and disapproved flow monitor, respectively, the maximum potential concentration of NO_X and the maximum potential flow rate, as defined in sections 2.1.2.1 and 2.1.4.1 of appendix A to part 75 of this chapter.

(*3*) For a disapproved moisture monitoring system and disapproved diluent gas monitoring system, respectively, the minimum potential moisture percentage and either the maximum potential CO_2 concentration or the minimum potential O_2 concentration (as applicable), as defined in sections 2.1.5, 2.1.3.1, and 2.1.3.2 of appendix A to part 75 of this chapter.

(*4*) For a disapproved fuel flowmeter system, the maximum potential fuel flow rate, as defined in section 2.4.2.1 of appendix D to part 75 of this chapter.

(*5*) For a disapproved excepted NO_X monitoring system under appendix E to part 75 of this chapter, the fuel-specific maximum potential NO_X emission rate, as defined in § 72.2 of this chapter.

(B) The CAIR designated representative shall submit a notification of certification retest dates and a new certification application in accordance with paragraphs (d)(3)(i) and (ii) of this section.

(C) The owner or operator shall repeat all certification tests or other requirements that were failed by the monitoring system, as indicated in the permitting authority's or the Administrator's notice of disapproval, no later than 30 unit operating days after the date of issuance of the notice of disapproval.

(e) *Initial certification and recertification procedures for units using the low mass emission excepted methodology under § 75.19 of this chapter.* The owner or operator of a unit qualified to use the low mass emissions (LME) excepted methodology under § 75.19 of this chapter shall meet the applicable certification and recertification requirements in §§ 75.19(a)(2) and 75.20(h) of this chapter. If the owner or operator of such a unit elects to certify a fuel flowmeter system for heat input determination, the owner or operator shall also meet the certification and recertification requirements in § 75.20(g) of this chapter.

(f) *Certification/recertification procedures for alternative monitoring systems.* The CAIR designated representative of each unit for which the owner or operator intends to use an alternative monitoring system approved by the Administrator and, if applicable, the permitting authority under subpart E of part 75 of this chapter shall comply with the applicable notification and application procedures of § 75.20(f) of this chapter.

§ 96.372 Out of control periods.

(a) Whenever any monitoring system fails to meet the quality-assurance and quality-control requirements or data validation requirements of part 75 of this chapter, data shall be substituted using the applicable missing data procedures in subpart D or subpart H of, or appendix D or appendix E to, part 75 of this chapter.

(b) *Audit decertification.* Whenever both an audit of a monitoring system and a review of the initial certification or recertification application reveal that any monitoring system should not have been certified or recertified because it did not meet a particular performance specification or other requirement under § 96.371 or the applicable provisions of part 75 of this chapter, both at the time of the initial certification or recertification application submission and at the time of the audit, the permitting authority or, for a CAIR NO_X Ozone Season opt-in unit or a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart IIII of this part, the Administrator will issue a notice of disapproval of the certification status of such monitoring system. For the purposes of this paragraph, an audit shall be either a field audit or an audit of any information submitted to the permitting authority or the Administrator. By issuing the notice of disapproval, the permitting authority or the Administrator revokes prospectively the certification status of the monitoring system. The data measured and recorded by the monitoring system shall not be considered valid quality-assured data from the date of issuance of the notification of the revoked certification status until the date and time that the owner or operator completes subsequently approved initial certification or recertification tests for the monitoring system. The owner or operator shall follow the applicable initial certification or recertification procedures in § 96.371 for each disapproved monitoring system.

§ 96.373 Notifications.

The CAIR designated representative for a CAIR NO_X Ozone Season unit shall submit written notice to the permitting authority and the Administrator in accordance with § 75.61 of this chapter, except that if the unit is not subject to an Acid Rain emissions limitation, the notification is only required to be sent to the permitting authority.

§ 96.374 Recordkeeping and reporting.

(a) *General provisions.* The CAIR designated representative shall comply with all recordkeeping and reporting requirements in this section, the applicable recordkeeping and reporting requirements under § 75.73 of this chapter, and the requirements of § 96.310(e)(1).

(b) *Monitoring plans.* The owner or operator of a CAIR NO_X Ozone Season unit shall comply with requirements of § 75.73(c) and (e) of this chapter and, for a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under subpart IIII of this part, §§ 96.383 and 96.384(a).

(c) *Certification applications.* The CAIR designated representative shall submit an application to the permitting authority within 45 days after completing all initial certification or recertification tests required under § 96.371, including the information required under § 75.63 of this chapter.

(d) *Quarterly reports.* The CAIR designated representative shall submit quarterly reports, as follows:

(1) If the CAIR NO_X Ozone Season unit is subject to an Acid Rain emissions limitation or a CAIR NO_X emissions limitation or if the owner or operator of such unit chooses to report on an annual basis under this subpart, the CAIR designated representative shall meet the requirements of subpart H of part 75 of this chapter (concerning monitoring of NO_X mass emissions) for

NMED Exhibit 7f

such unit for the entire year and shall report the NO_X mass emissions data and heat input data for such unit, in an electronic quarterly report in a format prescribed by the Administrator, for each calendar quarter beginning with:

(i) For a unit that commences commercial operation before July 1, 2007, the calendar quarter covering May 1, 2008 through June 30, 2008; or

(ii) For a unit that commences commercial operation on or after July 1, 2007, the calendar quarter corresponding to the earlier of the date of provisional certification or the applicable deadline for initial certification under § 96.370(b), unless that quarter is the third or fourth quarter of 2007, in which case reporting shall commence in the quarter covering May 1, 2008 through June 30, 2008.

(2) If the CAIR NO_X Ozone Season unit is not subject to an Acid Rain emissions limitation or a CAIR NO_X emissions limitation, then the CAIR designated representative shall either:

(i) Meet the requirements of subpart H of part 75 (concerning monitoring of NO_X mass emissions) for such unit for the entire year and report the NO_X mass emissions data and heat input data for such unit in accordance with paragraph (d)(1) of this section; or

(ii) Meet the requirements of subpart H of part 75 for the control period (including the requirements in § 75.74(c) of this chapter) and report NO_X mass emissions data and heat input data (including the data described in § 75.74(c)(6) of this chapter) for such unit only for the control period of each year and report, in an electronic quarterly report in a format prescribed by the Administrator, for each calendar quarter beginning with:

(A) For a unit that commences commercial operation before July 1, 2007, the calendar quarter covering May 1, 2008 through June 30, 2008;

(B) For a unit that commences commercial operation on or after July 1, 2007, the calendar quarter corresponding to the earlier of the date of provisional certification or the applicable deadline for initial certification under § 96.370(b), unless that date is not during a control period, in which case reporting shall commence in the quarter that includes May 1 through June 30 of the first control period after such date.

(2) The CAIR designated representative shall submit each quarterly report to the Administrator within 30 days following the end of the calendar quarter covered by the report. Quarterly reports shall be submitted in the manner specified in § 75.73(f) of this chapter.

(3) For CAIR NO_X Ozone Season units that are also subject to an Acid Rain emissions limitation or the CAIR NO_X Annual Trading Program or CAIR SO_2 Trading Program, quarterly reports shall include the applicable data and information required by subparts F through H of part 75 of this chapter as applicable, in addition to the NO_X mass emission data, heat input data, and other information required by this subpart.

(e) *Compliance certification.* The CAIR designated representative shall submit to the Administrator a compliance certification (in a format prescribed by the Administrator) in support of each quarterly report based on reasonable inquiry of those persons with primary responsibility for ensuring that all of the unit's emissions are correctly and fully monitored. The certification shall state that:

(1) The monitoring data submitted were recorded in accordance with the applicable requirements of this subpart and part 75 of this chapter, including the quality assurance procedures and specifications;

(2) For a unit with add-on NO_X emission controls and for all hours where NO_X data are substituted in accordance with § 75.34(a)(1) of this chapter, the add-on emission controls were operating within the range of parameters listed in the quality assurance/quality control program under appendix B to part 75 of this chapter and the substitute data values do not systematically underestimate NO_X emissions; and

(3) For a unit that is reporting on a control period basis under paragraph (d)(2)(ii) of this section, the NO_X emission rate and NO_X concentration values substituted for missing data under subpart D of part 75 of this chapter are calculated using only values from a control period and do not systematically underestimate NO_X emissions.

§ 96.375 Petitions.

(a) Except as provided in paragraph (b)(2) of this section, the CAIR designated representative of a CAIR NO_X Ozone Season unit that is subject to an Acid Rain emissions limitation may submit a petition under § 75.66 of this chapter to the Administrator requesting approval to apply an alternative to any requirement of this subpart. Application of an alternative to any requirement of this subpart is in accordance with this subpart only to the extent that the petition is approved in writing by the Administrator, in consultation with the permitting authority.

(b)(1) The CAIR designated representative of a CAIR NO_X Ozone Season unit that is not subject to an Acid Rain emissions limitation may submit a petition under § 75.66 of this chapter to the permitting authority and the Administrator requesting approval to apply an alternative to any requirement of this subpart. Application of an alternative to any requirement of this subpart is in accordance with this subpart only to the extent that the petition is approved in writing by both the permitting authority and the Administrator.

(2) The CAIR designated representative of a CAIR NO_X Ozone Season unit that is subject to an Acid Rain emissions limitation may submit a petition under § 75.66 of this chapter to the permitting authority and the Administrator requesting approval to apply an alternative to a requirement concerning any additional continuous emission monitoring system required under § 75.72 of this chapter. Application of an alternative to any such requirement is in accordance with this subpart only to the extent that the petition is approved in writing by both the permitting authority and the Administrator.

§ 96.376 Additional requirements to provide heat input data.

The owner or operator of a CAIR NO_X Ozone Season unit that monitors and reports NO_X mass emissions using a NO_X concentration system and a flow system shall also monitor and report heat input rate at the unit level using the procedures set forth in part 75 of this chapter.

Subpart IIII—CAIR NO_X Ozone Season Opt-in Units

§ 96.380 Applicability.

A CAIR NO_X Ozone Season opt-in unit must be a unit that:

(a) Is located in the State;

(b) Is not a CAIR NO_X Ozone Season unit under § 96.304 and is not covered by a retired unit exemption under § 96.305 that is in effect;

(c) Is not covered by a retired unit exemption under § 72.8 of this chapter that is in effect;

(d) Has or is required or qualified to have a title V operating permit or other federally enforceable permit; and

(e) Vents all of its emissions to a stack and can meet the monitoring, recordkeeping, and reporting requirements of subpart HHHH of this part.

§ 96.381 General.

(a) Except as otherwise provided in §§ 96.301 through 96.304, §§ 96.306

through 96.308, and subparts BBBB and CCCC and subparts FFFF through HHHH of this part, a CAIR NO_X Ozone Season opt-in unit shall be treated as a CAIR NO_X Ozone Season unit for purposes of applying such sections and subparts of this part.

(b) Solely for purposes of applying, as provided in this subpart, the requirements of subpart HHHH of this part to a unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under this subpart, such unit shall be treated as a CAIR NO_X Ozone Season unit before issuance of a CAIR opt-in permit for such unit.

§ 96.382 CAIR designated representative.

Any CAIR NO_X Ozone Season opt-in unit, and any unit for which a CAIR opt-in permit application is submitted and not withdrawn and a CAIR opt-in permit is not yet issued or denied under this subpart, located at the same source as one or more CAIR NO_X Ozone Season units shall have the same CAIR designated representative and alternate CAIR designated representative as such CAIR NO_X Ozone Season units.

§ 96.383 Applying for CAIR opt-in permit.

(a) *Applying for initial CAIR opt-in permit.* The CAIR designated representative of a unit meeting the requirements for a CAIR NO_X Ozone Season opt-in unit in § 96.380 may apply for an initial CAIR opt-in permit at any time, except as provided under § 96.386 (f) and (g), and, in order to apply, must submit the following:

(1) A complete CAIR permit application under §96.322;

(2) A certification, in a format specified by the permitting authority, that the unit:

(i) Is not a CAIR NO_X Ozone Season unit under § 96.304 and is not covered by a retired unit exemption under § 96.305 that is in effect;

(ii) Is not covered by a retired unit exemption under § 72.8 of this chapter that is in effect;

(iii) Vents all of its emissions to a stack; and

(iv) Has documented heat input for more than 876 hours during the 6 months immediately preceding submission of the CAIR permit application under §96.322;

(3) A monitoring plan in accordance with subpart HHHH of this part;

(4) A complete certificate of representation under § 96.313 consistent with § 96.382, if no CAIR designated representative has been previously designated for the source that includes the unit; and

(5) A statement, in a format specified by the permitting authority, whether the CAIR designated representative requests that the unit be allocated CAIR NO_X Ozone Season allowances under § 96.388(c) (subject to the conditions in §§ 96.384(h) and 96.386(g)).

(b) *Duty to reapply.* (1) The CAIR designated representative of a CAIR NO_X Ozone Season opt-in unit shall submit a complete CAIR permit application under § 96.322 to renew the CAIR opt-in unit permit in accordance with the permitting authority's regulations for title V operating permits, or the permitting authority's regulations for other federally enforceable permits if applicable, addressing permit renewal.

(2) Unless the permitting authority issues a notification of acceptance of withdrawal of the CAIR opt-in unit from the CAIR NO_X Annual Trading Program in accordance with § 96.186 or the unit becomes a CAIR NO_X unit under § 96.304, the CAIR NO_X opt-in unit shall remain subject to the requirements for a CAIR NO_X opt-in unit, even if the CAIR designated representative for the CAIR NO_X opt-in unit fails to submit a CAIR permit application that is required for renewal of the CAIR opt-in permit under paragraph (b)(1) of this section.

§ 96.384 Opt-in process.

The permitting authority will issue or deny a CAIR opt-in permit for a unit for which an initial application for a CAIR opt-in permit under § 96.383 is submitted in accordance with the following:

(a) Interim review of monitoring plan. The permitting authority and the Administrator will determine, on an interim basis, the sufficiency of the monitoring plan accompanying the initial application for a CAIR opt-in permit under § 96.383. A monitoring plan is sufficient, for purposes of interim review, if the plan appears to contain information demonstrating that the NO_X emissions rate and heat input of the unit and all other applicable parameters are monitored and reported in accordance with subpart HHHH of this part. A determination of sufficiency shall not be construed as acceptance or approval of the monitoring plan.

(b) *Monitoring and reporting.* (1)(i) If the permitting authority and the Administrator determine that the monitoring plan is sufficient under paragraph (a) of this section, the owner or operator shall monitor and report the NO_X emissions rate and the heat input of the unit emissions rate and the heat input of the unit and all other applicable parameters, in accordance with subpart HHHH of this part, starting on the date of certification of the appropriate monitoring systems under subpart HHHH of this part and continuing until a CAIR opt-in permit is denied under § 96.384(f) or, if a CAIR opt-in permit is issued, the date and time when the unit is withdrawn from the CAIR NO_X Ozone Season Trading Program in accordance with § 96.386.

(ii) The monitoring and reporting under paragraph (b)(1)(i) of this section shall include the entire control period immediately before the date on which the unit enters the CAIR NO_X Ozone Season Trading Program under § 96.384(g), during which period monitoring system availability must not be less than 90 percent under subpart HHHH of this part and the unit must be in full compliance with any applicable State or Federal emissions or emissions-related requirements.

(2) To the extent the NO_X emissions rate and the heat input of the unit are monitored and reported in accordance with subpart HHHH of this part for one or more control periods, in addition to the control period under paragraph (b)(1)(ii) of this section, during which control periods monitoring system availability is not less than 90 percent under subpart HHHH of this part and the unit is in full compliance with any applicable State or Federal emissions or emissions-related requirements and which control periods begin not more than 3 years before the unit enters the CAIR NO_X Ozone Season Trading Program under § 96.384(g), such information shall be used as provided in paragraphs (c) and (d) of this section.

(c) *Baseline heat input.* The unit's baseline heat rate shall equal:

(1) If the unit's NO_X emissions rate and heat input are monitored and reported for only one control period, in accordance with paragraph (b)(1) of this section, the unit's total heat input (in mmBtu) for the control period; or

(2) If the unit's NO_X emissions rate and heat input are monitored and reported for more than one control period, in accordance with paragraphs (b)(1) and (2) of this section, the average of the amounts of the unit's total heat input (in mmBtu) for the control period under paragraph (b)(1)(ii) of this section and the control periods under paragraph (b)(2) of this section.

(d) *Baseline NO_X emission rate.* The unit's baseline NO_X emission rate shall equal:

(1) If the unit's NO_X emissions rate and heat input are monitored and reported for only one control period, in accordance with paragraph (b)(1) of this section, the unit's NO_X emissions rate (in lb/mmBtu) for the control period;

(2) If the unit's NO_X emissions rate and heat input are monitored and

reported for more than one control period, in accordance with paragraphs (b)(1) and (2) of this section, and the unit does not have add-on NO_X emission controls during any such control periods, the average of the amounts of the unit's NO_X emissions rate (in lb/mmBtu) for the control period under paragraph (b)(1)(ii) of this section and the control periods under paragraph (b)(2) of this section; or

(3) If the unit's NO_X emissions rate and heat input are monitored and reported for more than one control period, in accordance with paragraphs (b)(1) and (2) of this section, and the unit has add-on NO_X emission controls during any such control periods, the average of the amounts of the unit's NO_X emissions rate (in lb/mmBtu) for such control period during which the unit has add-on NO_X emission controls.

(e) Issuance of CAIR opt-in permit. After calculating the baseline heat input and the baseline NO_X emissions rate for the unit under paragraphs (c) and (d) of this section and if the permitting authority determines that the CAIR designated representative shows that the unit meets the requirements for a CAIR NO_X Ozone Season opt-in unit in § 96.380 and meets the elements certified in § 96.383(a)(2), the permitting authority will issue a CAIR opt-in permit. The permitting authority will provide a copy of the CAIR opt-in permit to the Administrator, who will then establish a compliance account for the source that includes the CAIR NO_X Ozone Season opt-in unit unless the source already has a compliance account.

(f) *Issuance of denial of CAIR opt-in permit.* Notwithstanding paragraphs (a) through (e) of this section, if at any time before issuance of a CAIR opt-in permit for the unit, the permitting authority determines that the CAIR designated representative fails to show that the unit meets the requirements for a CAIR NO_X Ozone Season opt-in unit in § 96.380 or meets the elements certified in § 96.383(a)(2), the permitting authority will issue a denial of a CAIR opt-in permit for the unit.

(g) *Date of entry into CAIR NO_X Ozone Season Trading Program.* A unit for which an initial CAIR opt-in permit is issued by the permitting authority shall become a CAIR NO_X Ozone Season opt-in unit, and a CAIR NO_X Ozone Season unit, as of the later of May 1, 2009 or May 1 of the first control period during which such CAIR opt-in permit is issued.

(h) Repowered CAIR NO_X Ozone Season opt-in unit. (1) If CAIR designated representative requests, and the permitting authority issues a CAIR opt-in permit providing for, allocation to a CAIR NO_X Ozone Season opt-in unit of CAIR NO_X Ozone Season allowances under § 96.388(c) and such unit is repowered after its date of entry into the CAIR NO_X Ozone Season Trading Program under paragraph (g) of this section, the repowered unit shall be treated as a CAIR NO_X Ozone Season opt-in unit replacing the original CAIR NO_X Ozone Season opt-in unit, as of the date of start-up of the repowered unit's combustion chamber.

(2) Notwithstanding paragraphs (c) and (d) of this section, as of the date of start-up under paragraph (h)(1) of this section, the repowered unit shall be deemed to have the same date of commencement of operation, date of commencement of commercial operation, baseline heat input, and baseline NO_X emission rate as the original CAIR NO_X Ozone Season opt-in unit, and the original CAIR NO_X Ozone Season opt-in unit shall no longer be treated as a CAIR opt-in unit or a CAIR NO_X Ozone Season unit.

§ 96.385 CAIR opt-in permit contents.

(a) Each CAIR opt-in permit will contain:

(1) All elements required for a complete CAIR permit application under § 96.322;

(2) The certification in § 96.383(a)(2);

(3) The unit's baseline heat input under § 96.384(c);

(4) The unit's baseline NO_X emission rate under § 96.384(d);

(5) A statement whether the unit is to be allocated CAIR NO_X Ozone Season allowances under § 96.388(c) (subject to the conditions in §§ 96.384(h) and 96.386(g));

(6) A statement that the unit may withdraw from the CAIR NO_X Ozone Season Trading Program only in accordance with § 96.386; and

(7) A statement that the unit is subject to, and the owners and operators of the unit must comply with, the requirements of § 96.387.

(b) Each CAIR opt-in permit is deemed to incorporate automatically the definitions of terms under § 96.302 and, upon recordation by the Administrator under subpart FFFF or GGGG of this part or this subpart, every allocation, transfer, or deduction of CAIR NO_X Ozone Season allowances to or from the compliance account of the source that includes a CAIR NO_X Ozone Season opt-in unit covered by the CAIR opt-in permit.

§ 96.386 Withdrawal from CAIR NO_X Ozone Season Trading Program.

Except as provided under paragraph (g) of this section, a CAIR NO_X Ozone Season opt-in unit may withdraw from the CAIR NO_X Ozone Season Trading Program, but only if the permitting authority issues a notification to the CAIR designated representative of the CAIR NO_X Ozone Season opt-in unit of the acceptance of the withdrawal of the CAIR NO_X Ozone Season opt-in unit in accordance with paragraph (d) of this section.

(a) *Requesting withdrawal.* In order to withdraw a CAIR opt-in unit from the CAIR NO_X Ozone Season Trading Program, the CAIR designated representative of the CAIR NO_X Ozone Season opt-in unit shall submit to the permitting authority a request to withdraw effective as of midnight of September 30 of a specified calendar year, which date must be at least 4 years after September 30 of the year of entry into the CAIR NO_X Ozone Season Trading Program under § 96.384(g). The request must be submitted no later than 90 days before the requested effective date of withdrawal.

(b) *Conditions for withdrawal.* Before a CAIR NO_X Ozone Season opt-in unit covered by a request under paragraph (a) of this section may withdraw from the CAIR NO_X Ozone Season Trading Program and the CAIR opt-in permit may be terminated under paragraph (e) of this section, the following conditions must be met:

(1) For the control period ending on the date on which the withdrawal is to be effective, the source that includes the CAIR NO_X Ozone Season opt-in unit must meet the requirement to hold CAIR NO_X Ozone Season allowances under § 96.306(c) and cannot have any excess emissions.

(2) After the requirement for withdrawal under paragraph (b)(1) of this section is met, the Administrator will deduct from the compliance account of the source that includes the CAIR NO_X Ozone Season opt-in unit CAIR NO_X Ozone Season allowances equal in number to and allocated for the same or a prior control period as any CAIR NO_X Ozone Season allowances allocated to the CAIR NO_X Ozone Season opt-in unit under § 96.388 for any control period for which the withdrawal is to be effective. If there are no remaining CAIR NO_X Ozone Season units at the source, the Administrator will close the compliance account, and the owners and operators of the CAIR NO_X Ozone Season opt-in unit may submit a CAIR NO_X Ozone Season allowance transfer for any remaining CAIR NO_X Ozone Season allowances to another CAIR NO_X Ozone Season Allowance Tracking System in accordance with subpart GGGG of this part.

NMED Exhibit 7f

(c) *Notification.* (1) After the requirements for withdrawal under paragraphs (a) and (b) of this section are met (including deduction of the full amount of CAIR NO_X Ozone Season allowances required), the permitting authority will issue a notification to the CAIR designated representative of the CAIR NO_X Ozone Season opt-in unit of the acceptance of the withdrawal of the CAIR NO_X Ozone Season opt-in unit as of midnight on September 30 of the calendar year for which the withdrawal was requested.

(2) If the requirements for withdrawal under paragraphs (a) and (b) of this section are not met, the permitting authority will issue a notification to the CAIR designated representative of the CAIR NO_X Ozone Season opt-in unit that the CAIR NO_X Ozone Season opt-in unit's request to withdraw is denied. Such CAIR NO_X opt-in unit shall continue to be a CAIR NO_X Ozone Season opt-in unit.

(d) *Permit amendment.* After the permitting authority issues a notification under paragraph (c)(1) of this section that the requirements for withdrawal have been met, the permitting authority will revise the CAIR permit covering the CAIR NO_X Ozone Season opt-in unit to terminate the CAIR opt-in permit for such unit as of the effective date specified under paragraph (c)(1) of this section. The unit shall continue to be a CAIR NO_X Ozone Season opt-in unit until the effective date of the termination and shall comply with all requirements under the CAIR NO_X Ozone Season Trading Program concerning any control periods for which the unit is a CAIR NO_X Ozone Season opt-in unit, even if such requirements arise or must be complied with after the withdrawal takes effect.

(e) Reapplication upon failure to meet conditions of withdrawal. If the permitting authority denies the CAIR NO_X Ozone Season opt-in unit's request to withdraw, the CAIR designated representative may submit another request to withdraw in accordance with paragraphs (a) and (b) of this section.

(f) *Ability to reapply to the CAIR NO_X Ozone Season Trading Program.* Once a CAIR NO_X Ozone Season opt-in unit withdraws from the CAIR NO_X Ozone Season Trading Program and its CAIR opt-in permit is terminated under this section, the CAIR designated representative may not submit another application for a CAIR opt-in permit under § 96.383 for such CAIR NO_X Ozone Season opt-in unit before the date that is 4 years after the date on which the withdrawal became effective. Such new application for a CAIR opt-in permit will be treated as an initial application for a CAIR opt-in permit under § 96.384.

(g) Inability to withdraw. Notwithstanding paragraphs (a) through (f) of this section, a CAIR NO_X Ozone Season opt-in unit shall not be eligible to withdraw from the CAIR NO_X Ozone Season Trading Program if the CAIR designated representative of the CAIR NO_X opt-in unit requests, and the permitting authority issues a CAIR opt-in permit providing for, allocation to the CAIR NO_X Ozone Season opt-in unit of CAIR NO_X Ozone Season allowances under § 96.388(c).

§ 96.387 Change in regulatory status.

(a) *Notification.* If a CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304, then the CAIR designated representative shall notify in writing the permitting authority and the Administrator of such change in the CAIR NO_X Ozone Season opt-in unit's regulatory status, within 30 days of such change.

(b) *Permitting authority's and Administrator's actions.* (1) If a CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304, the permitting authority will revise the CAIR NO_X Ozone Season opt-in unit's CAIR opt-in permit to meet the requirements of a CAIR permit under § 96.323 as of the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304.

(2)(i) The Administrator will deduct from the compliance account of the source that includes the CAIR NO_X Ozone Season opt-in unit that becomes a CAIR NO_X Ozone Season unit under § 96.304, CAIR NO_X Ozone Season allowances equal in number to and allocated for the same or a prior control period as:

(A) Any CAIR NO_X Ozone Season allowances allocated to the CAIR NO_X Ozone Season opt-in unit under § 96.388 for any control period after the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304; and

(B) If the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304 is not September 30, the CAIR NO_X Ozone Season allowances allocated to the CAIR NO_X Ozone Season opt-in unit under § 96.388 for the control period that includes the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304, multiplied by the ratio of the number of days, in the control period, starting with the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304 divided by the total number of days in the control period and rounded to the nearest whole allowance as appropriate.

(ii) The CAIR designated representative shall ensure that the compliance account of the source that includes the CAIR NO_X Ozone Season unit that becomes a CAIR NO_X Ozone Season unit under § 96.304 contains the CAIR NO_X Ozone Season allowances necessary for completion of the deduction under paragraph (b)(2)(i) of this section.

(3)(i) For every control period after the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304, the CAIR NO_X Ozone Season opt-in unit will be treated, solely for purposes of CAIR NO_X Ozone Season allowance allocations under § 96.342, as a unit that commences operation on the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304 and will be allocated CAIR NO_X Ozone Season allowances under § 96.342.

(ii) Notwithstanding paragraph (b)(3)(i) of this section, if the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304 is not May 1, the following number of CAIR NO_X Ozone Season allowances will be allocated to the CAIR NO_X Ozone Season opt-in unit (as a CAIR NO_X Ozone Season unit) under § 96.342 for the control period that includes the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304:

(A) The number of CAIR NO_X Ozone Season allowances otherwise allocated to the CAIR NO_X Ozone Season opt-in unit (as a CAIR NO_X Ozone Season unit) under § 96.342 for the control period multiplied by;

(B) The ratio of the number of days, in the control period, starting with the date on which the CAIR NO_X Ozone Season opt-in unit becomes a CAIR NO_X Ozone Season unit under § 96.304, divided by the total number of days in the control period; and

(C) Rounded to the nearest whole allowance as appropriate.

§ 96.388 NO_X allowance allocations to CAIR NO_X Ozone Season opt-in units.

(a) *Timing requirements.* (1) When the CAIR opt-in permit is issued under § 96.384(e), the permitting authority will allocate CAIR NO_X Ozone Season allowances to the CAIR NO_X Ozone Season opt-in unit, and submit to the Administrator the allocation for the control period in which a CAIR NO_X Ozone Season opt-in unit enters the

NMED Exhibit 7f

CAIR NO_X Ozone Season Trading Program under § 96.384(g), in accordance with paragraph (b) or (c) of this section.

(2) By no later than July 31 of the control period in which a CAIR opt-in unit enters the CAIR NO_X Ozone Season Trading Program under § 96.384(g) and July 31 of each year thereafter, the permitting authority will allocate CAIR NO_X Ozone Season allowances to the CAIR NO_X Ozone Season opt-in unit, and submit to the Administrator the allocation for the control period that includes such submission deadline and in which the unit is a CAIR NO_X opt-in unit, in accordance with paragraph (b)or (c) of this section.

(b) *Calculation of allocation.* For each control period for which a CAIR NO_X Ozone Season opt-in unit is to be allocated CAIR NO_X Ozone Season allowances, the permitting authority will allocate in accordance with the following procedures:

(1) The heat input (in mmBtu) used for calculating the CAIR NO_X Ozone Season allowance allocation will be the lesser of:

(i) The CAIR NO_X Ozone Season opt-in unit's baseline heat input determined under § 96.384(c); or

(ii) The CAIR NO_X Ozone Season opt-in unit's heat input, as determined in accordance with subpart HHHH of this part, for the immediately prior control period, except when the allocation is being calculated for the control period in which the CAIR NO_X Ozone Season opt-in unit enters the CAIR NO_X Ozone Season Trading Program under § 96.384(g).

(2) The NO_X emission rate (in lb/mmBtu) used for calculating CAIR NO_X Ozone Season allowance allocations will be the lesser of:

(i) The CAIR NO_X Ozone Season opt-in unit's baseline NO_X emissions rate (in lb/mmBtu) determined under § 96.384(d) and multiplied by 70 percent; or

(ii) The most stringent State or Federal NO_X emissions limitation applicable to the CAIR NO_X Ozone Season opt-in unit at any time during the control period for which CAIR NO_X Ozone Season allowances are to be allocated.

(3) The permitting authority will allocate CAIR NO_X Ozone Season allowances to the CAIR NO_X Ozone Season opt-in unit in an amount equaling the heat input under paragraph (b)(1) of this section, multiplied by the NO_X emission rate under paragraph (b)(2) of this section, divided by 2,000 lb/ton, and rounded to the nearest whole allowance as appropriate.

(c) Notwithstanding paragraph (b) of this section and if the CAIR designated representative requests, and the permitting authority issues a CAIR opt-in permit providing for, allocation to a CAIR NO_X Ozone Season opt-in unit of CAIR NO_X Ozone Season allowances under this paragraph (subject to the conditions in §§ 96.384(h) and 96.386(g)), the permitting authority will allocate to the CAIR NO_X Ozone Season opt-in unit as follows:

(1) For each control period in 2009 through 2014 for which the CAIR NO_X Ozone Season opt-in unit is to be allocated CAIR NO_X Ozone Season allowances,

(i) The heat input (in mmBtu) used for calculating CAIR NO_X Ozone Season allowance allocations will be determined as described in paragraph (b)(1) of this section.

(ii) The NO_X emission rate (in lb/mmBtu) used for calculating CAIR NO_X Ozone Season allowance allocations will be the lesser of:

(A) The CAIR NO_X Ozone Season opt-in unit's baseline NO_X emissions rate (in lb/mmBtu) determined under § 96.384(d); or

(B) The most stringent State or Federal NO_X emissions limitation applicable to the CAIR NO_X Ozone Season opt-in unit at any time during the control period in which the CAIR NO_X Ozone Season opt-in unit enters the CAIR NO_X Ozone Season Trading Program under § 96.384(g).

(iii) The permitting authority will allocate CAIR NO_X Ozone Season allowances to the CAIR NO_X Ozone Season opt-in unit in an amount equaling the heat input under paragraph (c)(1)(i) of this section, multiplied by the NO_X emission rate under paragraph (c)(1)(ii) of this section, divided by 2,000 lb/ton, and rounded to the nearest whole allowance as appropriate.

(2) For each control period in 2015 and thereafter for which the CAIR NO_X Ozone Season opt-in unit is to be allocated CAIR NO_X Ozone Season allowances,

(i) The heat input (in mmBtu) used for calculating the CAIR NO_X Ozone Season allowance allocations will be determined as described in paragraph (b)(1) of this section.

(ii) The NO_X emission rate (in lb/mmBtu) used for calculating the CAIR NO_X Ozone Season allowance allocation will be the lesser of:

(A) 0.15 lb/mmBtu;

(B) The CAIR NO_X Ozone Season opt-in unit's baseline NO_X emissions rate (in lb/mmBtu) determined under § 96.384(d); or

(C) The most stringent State or Federal NO_X emissions limitation applicable to the CAIR NO_X Ozone Season opt-in unit at any time during the control period for which CAIR NO_X Ozone Season allowances are to be allocated.

(iii) The permitting authority will allocate CAIR NO_X Ozone Season allowances to the CAIR NO_X Ozone Season opt-in unit in an amount equaling the heat input under paragraph (c)(2)(i) of this section, multiplied by the NO_X emission rate under paragraph (c)(2)(ii) of this section, divided by 2,000 lb/ton, and rounded to the nearest whole allowance as appropriate.

(d) *Recordation.* (1) The Administrator will record, in the compliance account of the source that includes the CAIR NO_X Ozone Season opt-in unit, the CAIR NO_X Ozone Season allowances allocated by the permitting authority to the CAIR NO_X Ozone Season opt-in unit under paragraph (a)(1) of this section.

(2) By September 1, of the control period in which a CAIR opt-in unit enters the CAIR NO_X Ozone Season Trading Program under § 96.384(g), and September 1 of each year thereafter, the Administrator will record, in the compliance account of the source that includes the CAIR NO_X Ozone Season opt-in unit, the CAIR NO_X Ozone Season allowances allocated by the permitting authority to the CAIR NO_X Ozone Season opt-in unit under paragraph (a)(2) of this section.

contains copyrighted material, Confidential Business Information (''CBI''), or other information whose disclosure is restricted by statute. Information claimed as CBI and other information whose disclosure is restricted by statute is not included in the official public docket or in the electronic public docket. EPA's policy is that copyrighted material, including copyrighted material contained in a public comment, will not be placed in EPA's electronic public docket but will be available only in printed, paper form in the official public docket. Although not all docket materials may be available electronically, you may still access any of the publicly available docket materials through the EPA Docket Center.

B. How and to whom do I submit comments?

You may submit comments as provided in the **ADDRESSES** section. Please ensure that your comments are submitted within the specified comment period. Comments received after the close of the comment period will be marked ''late.'' EPA is not required to consider these late comments.

If you submit an electronic comment, EPA recommends that you include your name, mailing address, and an email address or other contact information in the body of your comment and with any disk or CD ROM you submit. This ensures that you can be identified as the submitter of the comment and allows EPA to contact you in case EPA cannot read your comment due to technical difficulties or needs further information on the substance of your comment. Any identifying or contact information provided in the body of a comment will be included as part of the comment that is placed in the official public docket, and made available in EPA's electronic public docket. If EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, EPA may not be able to consider your comment.

Use of the *www.regulations.gov* Web site to submit comments to EPA electronically is EPA's preferred method for receiving comments. The electronic public docket system is an ''anonymous access'' system, which means EPA will not know your identity, email address, or other contact information unless you provide it in the body of your comment. In contrast to EPA's electronic public docket, EPA's electronic mail (email) system is not an ''anonymous access'' system. If you send an email comment directly to the Docket without going through *www.regulations.gov,* your email address is automatically captured and included as part of the comment that is placed in the official public docket, and made available in EPA's electronic public docket.

Dated: December 23, 2016.

Gautam Srinivasan,

Acting Associate General Counsel.

ENVIRONMENTAL PROTECTION AGENCY

[EPA–HQ–OAR–2016–0751; FRL–9958–02–OAR]

Notice of Availability of the Environmental Protection Agency's Preliminary Interstate Ozone Transport Modeling Data for the 2015 Ozone National Ambient Air Quality Standard (NAAQS)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice of data availability (NODA); request for public comment.

SUMMARY: The Environmental Protection Agency (EPA) is providing notice that preliminary interstate ozone transport modeling data and associated methods relative to the 2015 ozone National Ambient Air Quality Standard (NAAQS) are available for public review and comment. This information is being provided to help states develop State Implementation Plans (SIPs) to address the requirements of Clean Air Act (CAA) section 110(a)(2)(D)(i)(I) for the 2015 ozone NAAQS. The information available includes: (1) Emission inventories for 2011 and 2023, supporting data used to develop those emission inventories, methods and data used to process emission inventories into a form that can be used for air quality modeling; and (2) air quality

modeling results for 2011 and 2023, base period (*i.e.,* 2009–2013) average and maximum ozone design value concentrations, projected 2023 average and maximum ozone design value concentrations, and projected 2023 ozone contributions from state-specific anthropogenic emissions and other contribution categories to ozone concentrations at individual ozone monitoring sites.

A docket has been established to facilitate public review of the data and to track comments.

DATES: Comments must be received on or before 90 days after publication in the **Federal Register**.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–HQ–OAR–2016–0751, to the *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or withdrawn. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.,* on the Web, Cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *http://www2.epa.gov/dockets/commenting-epa-dockets.*

When submitting comments, remember to:

1. Identify the notice by docket number and other identifying information (subject heading, **Federal Register** date and page number).

2. Explain your comments, why you agree or disagree; suggest alternatives and substitute data that reflect your requested changes.

3. Describe any assumptions and provide any technical information and/or data that you used.

4. Provide specific examples to illustrate your concerns, and suggest alternatives.

5. Explain your views as clearly as possible, avoiding the use of profanity or personal threats.

6. Make sure to submit your comments by the comment period deadline identified.

For additional information about the EPA's public docket, visit the EPA Docket Center homepage at *http://www.epa.gov/epahome/dockets.htm.*

Docket: All documents in the docket are listed in the *www.regulations.gov* index. Although listed in the index, some information is not publicly available (*e.g.,* CBI or other information whose disclosure is restricted by statute). Certain other material, such as copyrighted material, will be publicly available only in hard copy. Publicly available docket materials are available either electronically in *www.regulations.gov* or in hard copy at the Air and Radiation Docket and Information Center, EPA/DC, WJC West Building, Room 3334, 1301 Constitution Ave. NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the Air Docket is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: For questions on the emissions data and on how to submit comments on the emissions-related projection methodologies, contact Alison Eyth, Air Quality Assessment Division, Environmental Protection Agency, Mail code: C339–02, 109 T.W. Alexander Drive, Research Triangle Park, NC 27709; telephone number: (919) 541–2478; fax number: (919) 541–1903; email: *eyth.alison@epa.gov.* For questions on the preliminary air quality modeling and ozone contributions and how to submit comments on the air quality modeling data and related methodologies, contact Norm Possiel, Air Quality Assessment Division, Environmental Protection Agency, Mail code: C439–01, 109 T.W. Alexander Drive, Research Triangle Park, NC 27709; telephone number: (919) 541–5692; fax number: (919) 541–0044; email: *possiel.norm@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. Background

On October 26, 2015 (80 FR 65292), the EPA published a rule revising the 8-hour ozone NAAQS from 0.075 parts per million (ppm) to a new, more protective level of 0.070 ppm. Section 110(a)(1) of the CAA requires states to submit SIPs that provide for the implementation, maintenance, and enforcement of a NAAQS within 3 years of the promulgation of a new or revised standard. Such plans are required to address the applicable requirements of CAA section 110(a)(2) and are generally referred to as ''infrastructure'' SIPs. Among the requirements in CAA section 110(a)(2) that must be addressed in these plans is the ''Good Neighbor'' provision, section 110(a)(2)(D)(i)(I), which requires states to develop SIPs that prohibit any source or other emissions activity within the state from emitting air pollutants in amounts that will contribute significantly to nonattainment or interfere with maintenance of the NAAQS in another state. With respect to the 2015 ozone NAAQS, the Good Neighbor SIPs are due within 3 years of promulgation of the revised NAAQS, or by October 26, 2018.

On October 1, 2015, when EPA Administrator McCarthy signed the ozone NAAQS revision, the agency also issued a memorandum [1] to EPA Regional Administrators communicating a process for delivering the protections afforded by the revised NAAQS, including implementing CAA requirements like the Good Neighbor provision. In that memorandum, the EPA emphasized that we will be working with state, local, federal and tribal partners to carry out the duties of ozone air quality management in a manner that maximizes common sense, flexibility and cost-effectiveness while achieving improved public health expeditiously and abiding by the legal requirements of the CAA.

The memorandum noted that the EPA believes that the Good Neighbor provision for the 2015 ozone NAAQS can be addressed in a timely fashion using the framework of the Cross-State Air Pollution Rule (CSAPR), especially given the court decisions upholding important elements of that framework.[2] The EPA also expressed its intent to issue timely information concerning interstate ozone transport for the 2015 ozone NAAQS as a first step to help

[1] Memorandum from Janet McCabe, Acting Assistant administrator, Office of Air and Radiation to Regional Administrators, Regions 1–10, ''Implementing the 2015 Ozone National Ambient Air Quality Standards,'' available at *https://www.epa.gov/sites/production/files/2015-10/documents/implementation_memo.pdf.*

[2] *See EPA* v. *EME Homer City Generation, L.P.,* 134 S. Ct. 1584, 1607 (2014) (holding the EPA's use of uniform oxides of nitrogen (NO_X) stringency to apportion emission reduction responsibilities among upwind states ''is an efficient and equitable solution to the allocation problem the Good Neighbor Provision requires the Agency to address''); *EME Homer City Generation, L.P.* v. *EPA,* 795 F.3d 118, 135–36 (D.C. Cir. 2015) (affirming EPA's use of air quality modeling to project future nonattainment and maintenance receptors and to calculate emissions budgets, and holding that the EPA affords independent effect to the ''interfere with maintenance'' prong of the Good Neighbor provision in identifying maintenance receptors).

NMED Exhibit 7g

facilitate the development of SIPs addressing the Good Neighbor provision. The EPA recognizes that the CAA provides that states have the primary responsibility to submit timely SIPs, as well as the EPA's own backstop role to develop and promulgate Federal Implementation Plans (FIPs), as appropriate.

This notice includes preliminary air quality modeling data that will help states as they develop SIPs to address the cross-state transport of air pollution under the CAA's Good Neighbor provision as it pertains to the 2015 ozone NAAQS. These data are considered preliminary because states may choose to modify or supplement these data in developing their Good Neighbor SIPs and/or EPA may update these data for the purpose of potential future analyses or regulatory actions related to interstate ozone transport for the 2015 ozone NAAQS.

The EPA has applied what it refers to as the CSAPR framework to address the requirements of the Good Neighbor provision for regional pollutants like ozone. This framework involves a 4-step process: (1) Identifying downwind receptors that are expected to have problems attaining or maintaining clean air standards (*i.e.,* NAAQS); (2) determining which upwind states contribute to these problems in amounts sufficient to ''link'' them to the downwind air quality problems; (3) for states linked to downwind air quality problems, identifying upwind emissions that significantly contribute to nonattainment or interfere with maintenance of the NAAQS by quantifying upwind reductions in ozone precursor emissions and apportioning emission reduction responsibility among upwind states; and (4) for states that are found to have emissions that significantly contribute to nonattainment or interfere with maintenance or the NAAQS downwind, adopting SIPs or FIPs that eliminate such emissions. The EPA applied this framework in the original CSAPR rulemaking (76 FR 48208) to address the Good Neighbor provision for the 1997 ozone NAAQS and the 1997 and 2006 fine particulate matter ($PM_{2.5}$) NAAQS. On October 26, 2016 (81 FR 74504), the EPA again applied this framework in an update to CSAPR (referred to as the CSAPR Update) to address the Good Neighbor provision for the 2008 ozone NAAQS. This notice provides information regarding steps 1 and 2 of the CSAPR framework for purposes of evaluating interstate transport with respect to the 2015 ozone NAAQS. This preliminary modeling to quantify contributions for the year 2023 is intended to help inform state efforts to address interstate transport with respect to the 2015 ozone NAAQS.

The year 2023 was used as the analytic year for this preliminary modeling because that year aligns with the expected attainment year for Moderate ozone nonattainment areas, given that the CAA requires the EPA to finalize area designations for the 2015 ozone NAAQS in October 2017.[3] *See North Carolina* v. *EPA,* 531 F.3d 896, 911–12 (D.C. Cir. 2008), *modified on reh'g,* 550 F.3d 1176 (holding the Good Neighbor provision requires implementation of emissions reductions be harmonized with the applicable downwind attainment dates).

As noted above, this notice meets the EPA's stated intention in the October 2015 memorandum to provide information relevant to the Good Neighbor provision for the 2015 ozone NAAQS. Specifically, this notice evaluates states' contributions to downwind ozone problems relative to the screening threshold—equivalent to 1 percent of the NAAQS—that the CSAPR framework uses to identify states ''linked'' to downwind air quality problems for further consideration to address interstate ozone transport. The EPA believes that states will find this information useful in their development of Good Neighbor SIPs for the 2015 ozone NAAQS, and we seek their comments on it.[4] The EPA believes that states may rely on this or other appropriate modeling, data or analyses to develop approvable Good Neighbor SIPs which, as noted previously, are due on October 26, 2018. States that act now to address their planning obligation pursuant to the Good Neighbor provision would benefit from improved ozone air quality both within the state and with respect to other states.

This notice provides an opportunity for review and comment on the agency's preliminary ozone transport modeling data relevant for the 2015 ozone NAAQS.

II. Air Quality Modeling and Related Data and Methodologies

A. Base Year and Future Base Case Emissions

For this transport assessment, the EPA used a 2011-based modeling platform to develop base year and future year emissions inventories for input to air quality modeling. This platform included meteorology for 2011, base year emissions for 2011, and future year base case emissions for 2023. The 2011 and 2023 air quality modeling results were used to identify areas that are projected to be nonattainment or have problems maintaining the 2015 ozone NAAQS in 2023. Ozone source apportionment modeling for 2023 was used to quantify contributions from emissions in each state to ozone concentrations at each of the projected nonattainment and maintenance receptors in that future year.[5]

The 2011 and 2023 emissions data and the state and federal rules included in the 2023 base case are described in detail in the documents, ''Preparation of Emissions Inventories for the Version 6.3 2011 Emissions Modeling Platform''; ''Updates to Emissions Inventories for the Version 6.3, 2011 Emissions Modeling Platform for the Year 2023''; and ''EPA Base Case v.5.16 for 2023 Ozone Transport NODA Using IPM Incremental Documentation''; all of which are available in the docket for this notice.

In brief, the 2011 base year emissions and projection methodologies used here to create emissions for 2023 are similar to what was used in the final CSAPR Update. The key differences between the 2011 inventories used for the final CSAPR Update and the 2011 inventories used for the 2015 ozone NAAQS preliminary interstate transport modeling include updates to mobile source and electric generating unit (EGU) emissions, the inclusion of fire emissions in Canada and Mexico, and updated estimates of anthropogenic emissions for Mexico. The key differences in methodologies for projecting non-EGU sector emissions (*e.g.,* onroad and nonroad mobile, oil

[3] *See* 42 U.S.C. 7407(d)(1)(B) (requiring the EPA to finalize designations no later than 2 years after promulgation of a new or revised NAAQS). On November 17, 2016 (81 FR 81276), the EPA proposed to retain its current approach in establishing attainment dates for each nonattainment area classification, which run from the effective date of designations. This approach is codified at 40 CFR 51.1103 for the 2008 ozone NAAQs, and the EPA proposed to retain the same approach for the 2015 ozone NAAQS. In addition, the EPA proposed the maximum attainment dates for nonattainment areas in each classification, which for Moderate ozone nonattainment is 6 years.

[4] Note that the emissions projections in this NODA are consistent with the implementation of various state and federal regulations, and that any change to the future implementation of these regulations may impact these projections and related findings.

[5] The 2023 ozone source apportionment modeling was performed using meteorology for the period May through September in order to focus on transport when 8-hour ozone concentrations are typically high at most locations. This modeling did not include high winter ozone concentrations that have been observed in certain parts of the Western U.S. which are believed to result from the combination of strong wintertime inversions, large NOx and volatile organic compound (VOC) emissions from nearby oil and gas operations, increased ultraviolet (UV) radiation intensity due to reflection off of snow-covered surfaces and potentially other local factors.

and gas, non-EGU point sources) to 2023 as compared to the methods used in the final CSAPR Update to project emissions to 2017 include (1) the use of data from the U.S. Energy Information Administration Annual Energy Outlook 2016 (AEO 2016) to project activity data for onroad mobile sources and the growth in oil and gas emissions, (2) additional general refinements to the projection of oil and gas emissions, (3) incorporation of data from the Mid-Atlantic Regional Air Management Association (MARAMA) for projection of non-EGU emissions for states in that region, and (4) updated mobile source emissions for California.

For EGUs, the EPA has included several key updates to the Integrated Planning Model (IPM) and its inputs for the agency's 2023 EGU projections used for the air quality modeling provided in this NODA. The updated IPM assumptions incorporated in the EPA's Base Case v.5.16 capture several market trends occurring in the power sector today, and the 2023 EGU projections reflect a continuation of these trends. Notably, natural gas prices remain historically low and are expected to remain low in the foreseeable future given that gas production and pipeline capacity continue to increase while storage is already at an all-time high. These factors have contributed to record-setting U.S. natural gas production levels for the fifth consecutive year in 2015 and record-setting consumption levels for the sixth consecutive year. Additionally, electricity demand growth (including retail sales and direct use) has slowed in every decade since the 1950s, from 9.8 percent per year from 1949 to 1959 to 0.5 percent per year from 2000 to 2015. This trend is projected to continue: AEO 2016 projects lower growth than projected in AEO 2015. In addition, these updated emission projections account for a continuing decline in the cost of renewable energy technologies such as wind and solar, as well as the recently extended production and investment tax credits that support their deployment. All of these factors result in decreased generation and capacity from conventional coal steam relative to EPA's EGU analyses that preceded these updated IPM inputs. Over the past 10 years, coal-fired electricity generation in the U.S. has declined from providing roughly half of the nation's supply to about one-third, and has been replaced with lower-cost sources such as natural gas, wind, and solar.

The updated EGU projections also include the Clean Power Plan (CPP), 80 FR 64662 (October 23, 2015). The modeling for the CSAPR Update did not include the CPP due to the former rule's focus on the 2017 ozone season, *see* 81 FR at 74529. In the CSAPR Update rulemaking, the agency had identified several key factors and uncertainties associated with measuring the effects of the CPP in 2017, but explained that the EPA ''continues to believe that the modeling for the CPP . . . was useful and reliable with respect to the model years analyzed for [the CPP] (*i.e.,* 2020, 2025, and 2030).'' *Id.*. The period of focus for the modeling here is in the mid-2020s, which falls within the CPP's interim performance period, and the EPA therefore believes it is appropriate to include the CPP in the modeling.[6] The CPP is targeted at reducing carbon pollution, but on average, nationwide, the CPP would also reduce NO_X emissions from EGUs. The agency therefore anticipates that, if the CPP were removed from the modeling, the overall net effect could be higher levels of NO_X emissions, on average, and potentially higher ozone concentrations and contributions at receptors. However, note that NO_X emissions from EGUs represent just one part of the total NO_X inventory. In this regard, for many states it is possible that changes in EGU NO_X emissions on the order of what might be expected in 2023 due to the CPP may have limited impact on the concentration and contribution data in this NODA, which are based on total NO_X emissions.

As noted above, EGU emissions used for the air quality modeling in this NODA are based on IPM v5.16 projections. However, states may choose to use other EGU projections in developing their Good Neighbor SIPs. To continue to update and improve both EPA's and states' EGU projections, the EPA and state agencies, with the facilitation of multi-jurisdictional organizations (MJOs), have been collaborating in a technical engagement process to inform future-year emission projections for EGUs. The ongoing information exchange and data comparison have facilitated a clearer understanding of the capabilities and constraints of various tools and methods. This process will continue to inform how the EPA and states produce EGU emission projections to inform efforts to reduce ozone transport.

The EPA observes there are differences between recent emissions and generation data and the corresponding future-year projections in this NODA. The EPA's modeling directly simulates how future-year energy trends and economic signals affect the composition of the fleet. In the 2023 projections presented in this NODA, the EPA's modeling does not project the operation of a number of coal-fired and oil-fired units due to simulated future-year economic conditions, whether or not such capacity has publicly-released plans to retire.[7] Some other projection methodologies, such as the approach used by the Eastern Regional Technical Advisory Committee (ERTAC), purposefully maintain the current composition of the fleet except where operators have announced expected changes. Comparing these projections is informative because there is inherent uncertainty in anticipating any future-year composition of the EGU fleet, since analysts cannot know in advance exactly which operators will decide to retire which facilities at any given time. The EPA is soliciting comments on whether and, if so, how different projection techniques for EGUs would affect emissions and air quality in a manner that could further assist states with their analysis of transported air pollution.

B. Air Quality Modeling

For the final CSAPR Update, EPA used the Comprehensive Air Quality Model with Extensions (CAMx) v6.20 as the air quality model. After the EPA performed air quality modeling for the final CSAPR Update, Ramboll Environ, the CAMx model developer, released an updated version of CAMx (version 6.30). In addition, EPA has recently sponsored updates to the Carbon Bond chemical mechanism in CAMx v6.30 related to halogen chemistry reactions that deplete ozone in marine (*i.e.,* salt water) environments. The updated chemistry is included in a new version 6.32 which the EPA has used for this analysis. Specifically, EPA used CAMx v6.32 for the 2011 base year and 2023 future base case air quality modeling to identify receptors and quantify contributions for the 2015 NAAQS transport assessment. Information on this version of CAMx can be found in the Release Notes and User's Guide for CAMx v6.30 and in a

[6] The CPP is stayed by the Supreme Court. *West Virginia et al.* v. *EPA,* No. 15A773 (U.S. Feb. 9, 2016). It is currently unclear what adjustments, if any, will need to be made to the CPP's implementation timing in light of the stay.

[7] Note that much of this change in operation is projected to occur as early as 2020, which is the first year of the 25-year horizon over which EPA's model is optimizing. EPA's modeling adopts the assumption of perfect foresight, which implies that agents know precisely the nature and timing of conditions in future years (*e.g.,* future natural gas supply, future demand) that affect the ultimate cost of decisions along the way. With this perfect foresight, the model looks throughout the entire modeling horizon and selects the overall lowest cost solution for the power sector over that time.

NMED Exhibit 7g

technical report describing the updated halogen chemistry in version 6.32. These documents can be found in the docket for this notice.[8] Details of the 2011 and 2023 CAMx model applications are described in the ''Air Quality Modeling Technical Support Document for the 2015 Ozone NAAQS Preliminary Interstate Transport Assessment'' (AQM TSD) which is available in the docket for this notice.

C. Information Regarding Potential 2023 Nonattainment and Maintenance Sites

The ozone predictions from the 2011 and 2023 CAMx model simulations were used to project 2009–2013 average and maximum ozone design values [9] to 2023 following the approach described in the EPA's draft guidance for attainment demonstration modeling.[10] Using the approach in the final CSAPR Update, we evaluated the 2023 projected average and maximum design values in conjunction with the most recent measured ozone design values (*i.e.,* 2013–2015) to identify sites that may warrant further consideration as potential nonattainment or maintenance sites in 2023.[11] If the approach in the CSAPR Update is applied to evaluate the projected design values, those sites with 2023 average design values that exceed the NAAQS and that are currently measuring nonattainment would be considered to be nonattainment receptors in 2023. Similarly, with the CSAPR Update approach, monitoring sites with a projected 2023 maximum design value that exceeds the NAAQS would be projected to be maintenance receptors in 2023. In the CSAPR Update approach, maintenance-only receptors include both those monitoring sites where the projected 2023 average design value is below the NAAQS, but the maximum design value is above the NAAQS, and monitoring sites with projected 2023 average design values that exceed the NAAQS, but for which current design values based on measured data do not exceed the NAAQS.

The base period 2009–2013 ambient and projected 2023 average and maximum design values and 2013–2015 and preliminary 2014–2016 measured design values at individual projected 2023 nonattainment receptor sites and maintenance-only receptor sites are provided in Tables 1 and 2, respectively.[12]

[8] CAMx v6.32 is a pre-release version of CAMx v6.40 which is expected to be made public by Ramboll Environ in late 2016 or early 2017.

[9] The ozone design value for a monitoring site is the 3-year average of the annual fourth-highest daily maximum 8-hour average ozone concentration.

[10] The December 3, 2014 ozone, fine particulate matter, and regional haze SIP modeling guidance is available at *http://www.epa.gov/ttn/scram/guidance/guide/Draft_O3-PM-RH_Modeling_Guidance-2014.pdf.*

[11] In determining compliance with the NAAQS, ozone design values are truncated to integer values. For example, a design value of 70.9 parts per billion (ppb) is truncated to 70 ppb which is attainment. In this manner, design values at or above 71.0 ppb are considered to exceed the NAAQS.

[12] The preliminary 2014–2016 design values are based on data from the Air Quality System (AQS) and AirNow and have not been certified by state agencies. Note that for some sites the preliminary 2014–2016 design values are higher than the corresponding data for 2013–2015.

[13] In this notice, the East includes all states from Texas northward to North Dakota and eastward to the East Coast. All states in the contiguous U.S. from New Mexico northward to Montana and westward to the West Coast are considered, for this notice, to be in the West.

D. Information Regarding Quantification of Ozone Contributions

The EPA performed nationwide, state-level ozone source apportionment modeling using the CAMx Ozone Source Apportionment Technology/Anthropogenic Precursor Culpability Analysis (OSAT/APCA) technique [14] to provide information regarding the expected contribution of 2023 base case NO_X and VOC emissions from all sources in each state to projected 2023 ozone concentrations at each air quality monitoring site. In the source apportionment model run, we tracked the ozone formed from each of the following contribution categories (*i.e.,* ''tags''):

- States—anthropogenic NO_X and VOC emissions from each of the contiguous 48 states and the District of Columbia tracked individually (emissions from all anthropogenic sectors in a given state were combined);
- Biogenics—biogenic NO_X and VOC emissions domain-wide (*i.e.,* not by state);
- Boundary Concentrations—concentrations transported into the modeling domain from the lateral boundaries;
- Tribes—the emissions from those tribal lands for which we have point source inventory data in the 2011 NEI (we did not model the contributions from individual tribes);
- Canada and Mexico—anthropogenic emissions from sources in the portions of Canada and Mexico included in the modeling domain (contributions from Canada and Mexico were not modeled separately);
- Fires—combined emissions from wild and prescribed fires domain-wide (*i.e.,* not by state); and
- Offshore—combined emissions from offshore marine vessels and offshore drilling platforms (*i.e.,* not by state).

The CAMx source apportionment model simulation was performed for the period May 1 through September 30 using the 2023 future base case emissions and 2011 meteorology for this time period. The hourly contributions [15] from each tag were processed to obtain the 8-hour average contributions corresponding to the time period of the 8-hour daily maximum concentration on each day in the 2023 model simulation. This step was performed for those model grid cells containing monitoring sites in order to obtain 8-hour average contributions for each day at the location of each site. The model-predicted contributions were applied in a relative sense to quantify the contributions to the 2023 average design value at each site. Additional details on the source apportionment modeling and the procedures for calculating contributions can be found in the AQM TSD. The resulting 2023 contributions from each tag to each monitoring site are provided in a file in the docket for this notice.[16] The largest contributions from each state to 2023 downwind nonattainment receptors and to downwind maintenance-only receptors are provided in Tables 3–1 and 3–2, respectively.

TABLE 3–1—LARGEST CONTRIBUTION FROM EACH STATE TO DOWNWIND 8-HOUR OZONE NONATTAINMENT RECEPTORS

[Units are ppb]

Upwind states	Largest contribution to a downwind nonattainment receptor	Upwind states	Largest contribution to a downwind nonattainment receptor
Alabama	0.37	Montana	0.09

In CSAPR and the CSAPR Update, the EPA used a contribution screening threshold of 1 percent of the NAAQS to identify upwind states that may significantly contribute to downwind nonattainment and/or maintenance problems and which warrant further analysis to determine if emissions reductions might be required from each state to address the downwind air quality problem. The EPA determined that 1 percent was an appropriate threshold to use in the analysis for those rulemakings because there were important, even if relatively small, contributions to identified nonattainment and maintenance receptors from multiple upwind states mainly in the eastern U.S. The agency has historically found that the 1 percent threshold is appropriate for identifying interstate transport linkages for states collectively contributing to downwind ozone nonattainment or maintenance problems because that threshold captures a high percentage of the total pollution transport affecting downwind receptors.

Based on the approach used in CSAPR and the CSAPR Update, upwind states that contribute ozone in amounts at or above the 1 percent of the NAAQS threshold to a particular downwind nonattainment or maintenance receptor would be considered to be ''linked'' to that receptor in step 2 of the CSAPR framework for purposes of further analysis in step 3 to determine whether and what emissions from the upwind state contribute significantly to downwind nonattainment and interfere with maintenance of the NAAQS at the downwind receptors. For the 2015 ozone NAAQS, the value of a 1 percent threshold would be 0.70 ppb. The individual upwind state to downwind receptor ''linkages'' and contributions based on a 0.70 ppb threshold are identified in the AQM TSD for this notice.

The EPA notes that, when applying the CSAPR framework, an upwind state's linkage to a downwind receptor alone does not determine whether the state significantly contributes to nonattainment or interferes with maintenance of a NAAQS to a downwind state. While the 1 percent screening threshold has been traditionally applied to evaluate upwind state linkages in eastern states where such collective contribution was identified, the EPA noted in the CSAPR Update that, as to western states, there may be geographically specific factors to consider in determining whether the 1 percent screening threshold is appropriate. For certain receptors, where the collective contribution of emissions from one or more upwind states may not be a considerable portion of the ozone concentration at the downwind receptor, the EPA and states have considered, and could continue to consider, other factors to evaluate those states' planning obligation pursuant to the Good Neighbor provision.[17] However, where the collective contribution of emissions from one or more upwind states is responsible for a considerable portion of the downwind air quality problem, the CSAPR framework treats a contribution from an individual state at or above 1 percent of the NAAQS as significant, and this reasoning applies regardless of where the receptor is geographically located.

III. Analytic Information Available for Public Comment

The EPA has placed key information related to the air quality model applications into the electronic docket for this notice. This information includes the AQM TSD, an Excel file which contains the 2009–2013 base period and 2023 projected average and maximum ozone design values at individual monitoring sites and the

[17] *See, e.g.,* 81 FR 31513 (May 19, 2016) (approving Arizona Good Neighbor SIP addressing 2008 ozone NAAQS based on determination that upwind states would not collectively contribute to a considerable portion of the downwind air quality problem).

NMED Exhibit 7g

ozone contributions to individual monitoring sites from anthropogenic emissions in each state and from the other individual categories included in the source apportionment modeling. Also in the docket for this notice are a number of emission summaries by sector, state, county, source classification code, month, unit, day, and control program. In addition, the raw emission inventory files, ancillary data, and scripts used to develop the air quality model-ready emissions which are not in a format accepted by the electronic docket are available from the Air Emissions Modeling Web site for the Version 6.3 Platform at *https://www.epa.gov/air-emissions-modeling/2011-version-63-platform.* Electronic copies of the emissions and non-emissions air quality modeling input files, the CAMx v6.32 model code and run scripts, and the air quality modeling output files from the 2011 and 2023 air quality modeling performed for the 2015 NAAQS ozone transport assessment can be obtained by contacting Norm Possiel at *possiel.norm@epa.gov.*

The EPA is requesting comment on the components of the 2011 air quality modeling platform, the methods for projecting 2023 ozone design value concentrations and the methods for calculating ozone contributions. The EPA is also seeking comment on the methods used to project emissions to future years, where 2023 is an example of such a year. Specifically, comments are requested regarding new datasets, impacts of existing and planned federal, state, and local control programs on emissions, and new methods that could be used to prepare more representative emissions projections. That is, EPA is seeking comments on the projection approach and data sets that are potentially useful for computing projected emissions. Commenters wishing to comment on inventory projection methods should submit to the docket comments that describe an alternative approach to the existing methods, along with documentation describing why that method is an improvement over the existing method. Summaries of the base and projected future year emission inventories are provided in the docket to aid in the review of these data. As indicated above, the comment period for this notice is 90 days from the date of publication in the **Federal Register.**

Dated: December 28, 2016.

Stephen Page,

Director, Office of Air Quality Planning and Standards.

FARM CREDIT ADMINISTRATION

Farm Credit Administration Board; Sunshine Act; Regular Meeting

AGENCY: Farm Credit Administration.

SUMMARY: Notice is hereby given, pursuant to the Government in the Sunshine Act, of the regular meeting of the Farm Credit Administration Board (Board).

DATE AND TIME: The regular meeting of the Board will be held at the offices of the Farm Credit Administration in McLean, Virginia, on January 12, 2017, from 9:00 a.m. until such time as the Board concludes its business.

FOR FURTHER INFORMATION CONTACT: Dale L. Aultman, Secretary to the Farm Credit Administration Board, (703) 883–4009, TTY (703) 883–4056.

ADDRESSES: Farm Credit Administration, 1501 Farm Credit Drive, McLean, Virginia 22102–5090. Submit attendance requests via email to *VisitorRequest@FCA.gov.* See **SUPPLEMENTARY INFORMATION** for further information about attendance requests.

SUPPLEMENTARY INFORMATION: Parts of this meeting of the Board will be open to the public (limited space available), and parts will be closed to the public. Please send an email to *VisitorRequest@FCA.gov* at least 24 hours before the meeting. In your email include: Name, postal address, entity you are representing (if applicable), and telephone number. You will receive an email confirmation from us. Please be prepared to show a photo identification when you arrive. If you need assistance for accessibility reasons, or if you have any questions, contact Dale L. Aultman, Secretary to the Farm Credit Administration Board, at (703) 883–4009. The matters to be considered at the meeting are:

Open Session

A. Approval of Minutes

- December 8, 2016

B. New Business

- Draft Third Amended and Restated Market Access Agreement to be entered into by the Farm Credit System Banks and the Federal Farm Credit Banks Funding Corporation

C. Reports

- Auditor's Report on FCA FY 2016/2015 Financial Statements

Closed Session*

- Executive Meeting with Auditors

* Session Closed-Exempt pursuant to 5 U.S.C. Section 552b(c)(2).

Dated: January 4, 2017.

Dale L. Aultman,

Secretary, Farm Credit Administration Board.

BILLING CODE 6705–01–P

FEDERAL RESERVE SYSTEM

Change in Bank Control Notices; Acquisitions of Shares of a Bank or Bank Holding Company

The notificants listed below have applied under the Change in Bank Control Act (12 U.S.C. 1817(j)) and § 225.41 of the Board's Regulation Y (12 CFR 225.41) to acquire shares of a bank or bank holding company. The factors that are considered in acting on the notices are set forth in paragraph 7 of the Act (12 U.S.C. 1817(j)(7)).

The notices are available for immediate inspection at the Federal Reserve Bank indicated. The notices also will be available for inspection at the offices of the Board of Governors. Interested persons may express their views in writing to the Reserve Bank indicated for that notice or to the offices of the Board of Governors. Comments must be received not later than January 24, 2017.

A. Federal Reserve Bank of Chicago (Colette A. Fried, Assistant Vice President) 230 South LaSalle Street, Chicago, Illinois 60690–1414:

1. *Paul James Sentry,* Verona, Wisconsin; to acquire more than 25 percent of Deerfield Financial Corporation, Madison, Wisconsin, and thereby indirectly control Bank of Deerfield, Deerfield, Wisconsin.

B. Federal Reserve Bank of Minneapolis (Jacquelyn K. Brunmeier, Assistant Vice President) 90 Hennepin Avenue, Minneapolis, Minnesota 55480–0291:

1. *Timothy Schneider, individually and as trustee of the Timothy Schneider Irrevocable Trust (''Trust''),* both in Adams, Minnesota; to acquire more than 10 percent of Adams Bancshares, Inc., and thereby indirectly control United Farmers State Bank, both in Adams, Minnesota.

C. Federal Reserve Bank of Kansas City (Dennis Denney, Assistant Vice President) 1 Memorial Drive, Kansas City, Missouri 64198–0001:

1. *Clay Muegge and Chad Muegge,* both of Lamont, Oklahoma; to retain shares of State Exchange Bancshares, Inc., and thereby indirectly retain shares of State Exchange Bank, both of Lamont, Oklahoma; and for approval as members of the Muegge Family Group that controls State Exchange Bancshares, Inc.

NMED Exhibit 7g

(d) A project description, including the timeframe within which the project is to be started and completed;

(e) The terms and conditions of the agreement, including any reporting requirements;

(f) All obligations of the parties; and

(g) The signatures of appropriate individuals authorized to bind the applicant and BOEM.

§ 583.305 What is the effective date of an agreement?

The agreement will become effective on the date when all parties to the agreement have signed it.

§ 583.306 How will BOEM enforce the agreement?

(a) Failure to comply with any applicable law or any provision, term, or condition of the agreement may result in the termination of the agreement and/or a referral to an appropriate Federal and/or State agency/agencies for enforcement. Termination of the agreement for noncompliance will be in the sole discretion of the Director.

(b) The failure to comply in a timely and satisfactory manner with any provision, term or condition of the agreement may delay or prevent BOEM's approval of future requests for use of OCS sand, gravel and shell resources on the part of the parties to the agreement.

§ 583.307 What is the term of the agreement?

(a) An agreement will terminate upon the following, whichever occurs first:

(1) The agreement expires by its own terms, unless the term is extended prior to expiration under § 583.309;

(2) The project is terminated, as set forth in § 583.310; or

(3) A party to the agreement notifies BOEM, in writing, that sufficient OCS sand, gravel and shell resources, up to the amount authorized in the agreement, have been obtained to complete the project.

(b) Absent extraordinary circumstances, no agreement will be for a term longer than 5 years from its effective date.

§ 583.308 What debarment or suspension obligations apply to transactions and contracts related to a project?

The parties to an agreement must ensure that all contracts and transactions related to an agreement issued under this part comply with 2 CFR part 180 and 2 CFR part 1400.

§ 583.309 What is the process for modifying the agreement?

(a) Unless otherwise provided for in the agreement, the parties to the agreement may submit to BOEM a written request to extend, modify, or change an agreement. BOEM is under no obligation to extend an agreement and cannot be held liable for the consequences of the expiration of an agreement. With the exception of paragraph (b) of this section, any such requests must be made at least 180 days before the term of the agreement expires. BOEM will respond to the request for modification within 30 days of receipt and request any necessary information and evaluations to comply with 30 CFR 583.301. BOEM may approve the request, disapprove it, or approve it with modifications subject to the requirements of 30 CFR 583.301.

(1) If BOEM approves a request to extend, modify or change an agreement, BOEM will draft an agreement modification for review by the parties to the agreement in the form of an amendment to the original agreement. The amendment will include:

(i) The agreement number, as assigned by BOEM;

(ii) The modification(s) agreed to;

(iii) Any additional mitigation required; and

(iv) The signatures of the parties to the agreement and BOEM.

(2) If BOEM disapproves a request to extend, modify, or change an agreement, BOEM will inform the parties to the agreement of the reasons in writing. Parties to the agreement may ask the BOEM Director for reconsideration in accordance with 30 CFR 583.105.

(b) By written request, for strictly minor modifications that do not change the substance of the project or the analyzed environmental effects of the project, including but not limited to, the change of a business address, the substitution of a different Federal, State or local government agency contact, or an extension of less than 30 days, parties to the agreement may memorialize the minor modification in a letter from BOEM to the parties indicating the request has been granted.

§ 583.310 When can the agreement be terminated?

(a) The Director will terminate any agreement issued under this part upon proof that it was obtained by fraud or misrepresentation, after notice and an opportunity to be heard has been afforded to the parties of the agreement.

(b) The Director may immediately suspend and subsequently terminate any agreement issued under this part when:

(1) There is noncompliance with the agreement, pursuant to 30 CFR 583.306(a); or

(2) It is necessary for reasons of national security or defense; or

(3) The Director determines that:

(i) Continued activity under the agreement would cause serious harm or damage to natural resources; life (including human and wildlife); property; the marine, coastal, or human environment; or sites, structures, or objects of historical or archaeological significance;

(ii) The threat of harm or damage will not disappear or decrease to an acceptable extent within a reasonable period of time; and

(iii) The advantages of termination outweigh the advantages of continuing the agreement.

(c) The Director will immediately notify the parties to the agreement of the suspension or termination. The Director will also mail a letter to the parties to the agreement at their record post office address with notice of any suspension or termination and the cause for such action.

(d) In the event that BOEM terminates an agreement under this section, none of the parties to the agreement will be entitled to compensation as a result of expenses or lost revenues that may result from the termination.

BILLING CODE 4310–MR–P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[EPA–R09–OAR–2015–0793; FRL–9944–08–Region 9]

Partial Approval and Partial Disapproval of Air Quality State Implementation Plans; Arizona; Infrastructure Requirements To Address Interstate Transport for the 2008 Ozone NAAQS

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) is proposing to partially approve and partially disapprove a State Implementation Plan (SIP) revision submitted by the Arizona Department of Environmental Quality on December 27, 2012, and supplemented on December 3, 2015, to address the interstate transport requirements of Clean Air Act (CAA or Act) section 110(a)(2)(D) with respect to the 2008 ozone (O_3) national ambient air quality standard (NAAQS). We are proposing to approve the portion of the Arizona SIP pertaining to significant contribution to

NMED Exhibit 7h

nonattainment or interference with maintenance in another state and proposing to disapprove the portion of Arizona's SIP pertaining to interstate transport visibility requirements. EPA's rationale for proposing to partially approve and partially disapprove Arizona's December 27, 2012 SIP revision and December 3, 2015 supplement is described in this notice. EPA previously took two separate actions on Arizona's December 27, 2012 submittal, on July 14, 2015 and August 10, 2015. We are taking comments on this proposal and plan to follow with a final action no later than June 7, 2016.

DATES: Written comments must be received on or before April 21, 2016.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–R09–OAR–2015–0793 at *http://www.regulations.gov,* or via email to *Clancy.Maeve@epa.gov.* For comments submitted at Regulations.gov, follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from Regulations.gov. For either manner of submission, the EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.* on the web, cloud, or other file sharing system). For additional submission methods, please contact the person identified in the **FOR FURTHER INFORMATION CONTACT** section. For the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *http://www2.epa.gov/dockets/commenting-epa-dockets.*

FOR FURTHER INFORMATION CONTACT: Maeve Clancy, EPA Region IX, (415) 947–4105, *Clancy.Maeve@epa.gov.*

SUPPLEMENTARY INFORMATION: Throughout this document, the terms "we," "us," and "our" refer to EPA.

Table of Contents

I. Background

CAA sections 110(a)(1) and (2) require states to address basic SIP requirements to implement, maintain and enforce the NAAQS no later than three years after the promulgation of a new or revised standard. Section 110(a)(2) outlines the specific requirements that each state is required to address in this SIP submission that collectively constitute the "infrastructure" of a state's air quality management program. SIP submittals that address these requirements are referred to as "infrastructure SIPs" (I–SIP). In particular, CAA section 110(a)(2)(D)(i)(I) requires that each SIP for a new or revised NAAQS contain adequate provisions to prohibit any source or other type of emissions activity within the state from emitting air pollutants that will "contribute significantly to nonattainment" (prong 1) or "interfere with maintenance" (prong 2) of the applicable air quality standard in any other state. CAA section 110(a)(2)(D)(i)(II) requires SIP provisions that prevent interference with measures required to be included in the applicable implementation plan for any other State under part C to prevent significant deterioration of air quality (prong 3) or to protect visibility (prong 4). This action addresses the section 110(a)(2)(D)(i) requirements of prongs 1, 2 and 4 with respect to Arizona's I–SIP submissions.

On March 27, 2008, EPA issued a revised NAAQS for ozone.[1] This action triggered a requirement for states to submit an I–SIP to address the applicable requirements of section 110(a)(2) within three years of issuance of the revised NAAQS.

On September 13, 2013, EPA issued "Guidance on Infrastructure State Implementation Plan (SIP) Elements under Clean Air Act Sections 110(a)(1) and 110(a)(2)," which provides "advice on the development of infrastructure SIPs for the 2008 ozone NAAQS . . . as well as infrastructure SIPs for new or revised NAAQS promulgated in the future." [2] EPA followed that guidance with an additional memo specific to 110(a)(2)(D)(i)(I) (prongs 1 and 2) requirements for the 2008 O_3 standard on January 22, 2015 entitled, "Information on the Interstate Transport "Good Neighbor" Provision for the 2008 Ozone NAAQS Under CAA Section 110(a)(2)(D)(i)(I)" (2015 transport memo).[3] While this memo did not provide specific guidance to western states on interstate transport, it did contain preliminary modeling information for western states. This 2015 transport memo, following the approach used in EPA's prior Cross-State Air Pollution Rule (CSAPR),[4] provided data identifying ozone monitoring sites that were projected to be in nonattainment or have maintenance problems for the 2008 ozone NAAQS in 2018. Also, EPA provided the projected contribution estimates from 2018 anthropogenic oxides of nitrogen (NO_X) and volatile organic compound (VOC) emissions in each state to ozone concentrations at each of the projected sites.

On August 4, 2015, EPA published a **Federal Register** Notice entitled, "Notice of Availability of the Environmental Protection Agency's Updated Ozone Transport Modeling Data for the 2008 Ozone NAAQS." [5] This Notice of Data Availability (NODA) is an update of the preliminary air quality modeling data that was released January 22, 2015. This NODA provided data identifying ozone monitoring sites that are projected to be nonattainment or have maintenance problems (following the CSAPR approach) for the 2008 ozone NAAQS in 2017.[6] Also, EPA provided the projected ozone contribution estimates from 2017 anthropogenic NO_X and VOC emissions in each state to ozone concentrations at each of the projected monitoring sites. The 2017 modeling released in the NODA was used to support EPA's proposed update to CSAPR to address CAA section 110(a)(2)(D)(i)(I) requirements with respect to the 2008 ozone NAAQS in the eastern U.S. ("CSAPR Update Rule").[7] CSAPR and its predecessor transport rules, the NO_X SIP Call and CAIR, were designed to address the collective contributions from the 37 states in the eastern U.S. and ozone contribution information was not calculated to or from the 11 states in the western U.S. The proposed CSAPR Update Rule and the supportive

NMED Exhibit 7h

modeling released in the NODA include data relevant to the West but did not evaluate potential interstate transport impacts in 11 western states, including Arizona. In this action, we are utilizing these data to evaluate the state's submittals and any interstate transport obligations under section 110(a)(2)(D)(i)(I).

EPA is obligated, pursuant to a judgement issued by the Northern District of California in *Sierra Club* vs. *McCarthy,* to take final action on 110(a)(2)(D) prongs 1, 2, and 4 of Arizona's December 2012 SIP revision by June 7, 2016.[8] In our July 2015 partial approval and partial disapproval of Arizona's I–SIP submittals for the 2008 Pb and 2008 ozone NAAQS, for the I–SIP elements C, D, J, and K, EPA partially approved and partially disapproved the submittals for purposes of 110(a)(2)(D)(i)(II) prong 3 and partially approved and partially disapproved the submittals for purposes of 110(a)(2)(D)(ii) (relating to CAA sections 115 and 126). We also stated our intention to propose action on the I–SIP for the 2008 ozone NAAQS 110(a)(2)(D)(i) prongs 1, 2, and 4 in a separate action.[9] We subsequently took action on I–SIP elements A, B, E–H, L, and M for the 2008 Pb and 2008 ozone NAAQS in August 2015.[10]

II. State Submittals

On December 27, 2012, the Arizona Department of Environmental Quality (ADEQ) submitted its 2008 ozone NAAQS I–SIP (2012 submittal). This submittal briefly summarized the CAA requirements of sections 110(a)(2)(D)(i), 110(a)(2)(D)(ii), and EPA's I–SIP action for the previous 1997 ozone NAAQS, but as to prongs 1, 2, and 4 did not identify or address any potential interstate transport impacts between Arizona and other states or interstate transport visibility requirements for the 2008 ozone NAAQS. On December 3, 2015, ADEQ submitted a supplement to the 2012 submittal addressing 110(a)(2)(D)(i) prongs 1, 2, and 4.[11] For the purposes of this action, we will refer to the supplemental submittal as the ''2015 submittal.'' The 2015 submittal represents ADEQ's comprehensive analysis of ozone transport from Arizona to surrounding states and addresses potential interstate transport linkages between Arizona and the El Centro, CA and Los Angeles, CA nonattainment receptors that were identified in the 2015 ozone transport memo and the 2015 NODA. The 2015 submittal also addresses the requirements of prong 4 (interstate transport visibility requirements).

In the 2015 submittal, ADEQ summarizes the state's impact on downwind states. While Arizona's impact on the El Centro and Los Angeles monitors is in each case above 1%, Arizona impacts only one of the seven projected nonattainment or maintenance receptors in the Los Angeles area, and contributes less than 1% to all other maintenance and nonattainment receptors. ADEQ further states that, ''In eastern states, the EPA has chosen a 1% of the standard threshold as a significant contribution. However, Arizona considers the southwest to be different.'' The state goes on to say that, ''It is unclear at this point what threshold is significant for southwestern states.'' EPA's assessment of these statements is described in the next section. The submittal also summarizes sources of VOCs and NO_X statewide, outlining the controls on anthropogenic emission sources with a focus on efforts to reduce NO_X through controls implemented via Arizona's Regional Haze SIP and EPA's Regional Haze Federal Implementation Plan (FIP) and current and future Maricopa County stationary source controls in the Arizona SIP. For more information on Arizona's source categories and emissions controls, please see the technical support document (TSD) associated with today's proposed rulemaking.

III. EPA's Assessment

110(a)(2)(D)(i)(I) Prong 1 and Prong 2

EPA proposes to approve Arizona's SIP submissions pertaining to CAA section 110(a)(2)(D)(i)(I), prongs 1 and 2, with respect to the 2008 ozone NAAQS. As explained below, EPA's proposal is based on the state's submission and EPA's analysis of several factors and available data.

To determine whether the CAA section 110(a)(2)(D)(i)(I), prongs 1 and 2 requirement is satisfied, EPA first must determine whether a state's emissions will contribute significantly to nonattainment or interfere with maintenance of a NAAQS in other states. If a state is determined not to make such contribution or interfere with maintenance of the NAAQS, then EPA can conclude that the state's SIP complies with the requirements of section 110(a)(2)(D)(i)(I). In several prior federal rulemakings interpreting section 110(a)(2)(D)(i)(I), EPA has evaluated whether a state will significantly contribute to nonattainment or interfere with maintenance of a NAAQS by first identifying downwind receptors that are expected to have problems attaining or maintaining the NAAQS.[12] EPA has then determined which upwind states contribute to these identified air quality problems in amounts sufficient to warrant further evaluation to determine if the state can make emission reductions to reduce its contribution. CSAPR and the proposed CSAPR Update used a screening threshold (1% of the NAAQS) to identify such contributing upwind states warranting further review and analysis. EPA's NODA used air quality modeling to evaluate contributions from upwind states to downward receptors. Applying the methodology used in CSAPR, the NODA modeling information indicates that emissions from Arizona contribute amounts exceeding the CSAPR 1% threshold at two projected downwind nonattainment sites in El Centro, California, and Los Angeles, California.[13]

EPA notes that it disagrees with ADEQ's contention that it is unclear what screening threshold is significant for southwestern states when addressing interstate transport contributions. EPA believes contribution from an individual state equal to or above 1% of the NAAQS could be considered significant where the collective contribution of emissions from one or more upwind states is responsible for a considerable portion of the downwind air quality problem regardless of where the receptor is geographically located.[14]

Accordingly, although EPA's modeling indicates that emissions from

[13] Data file with 2017 Ozone Contributions. Included in docket for: Notice of Availability of the Environmental Protection Agency's Updated Ozone Transport Modeling Data for the 2008 Ozone National Ambient Air Quality Standard (NAAQS), 80 FR 46271 (August 4, 2015).

[14] EPA has previously noted there may be additional criteria to evaluate regarding collective contribution of transported air pollution at certain locations in the West. See footnotes 4 and 7.

NMED Exhibit 7h

Arizona contribute above the 1% threshold to two projected downwind air quality problems, EPA examined several factors to determine whether Arizona should be considered to significantly contribute to nonattainment or interfere with maintenance of the NAAQS at those sites, including the air quality and contribution modeling, receptor data, and the statewide measures reducing emissions of VOCs and NO_X. EPA notes that no single piece of information is by itself dispositive of the issue for purposes of this analysis. Instead, EPA has considered the total weight of all the evidence taken together to evaluate whether Arizona significantly contributes to nonattainment or interferes with maintenance of the 2008 ozone NAAQS in those areas.

One such factor that EPA considers relevant to determining the nature of a projected receptor's interstate transport problem is the magnitude of ozone attributable to transport from all upwind states collectively contributing to the air quality problem. In CSAPR and the CSAPR Update Rule, EPA used the 1% air quality threshold to identify linkages between upwind states and downwind maintenance receptors. States whose contributions to a specific receptor meet or exceed the threshold were considered to be linked to that receptor. The linked states' emissions (and available emission reductions) were then analyzed further as a second step to EPA's contribution analysis. States whose contributions to all receptors were below the 1% threshold did not require further evaluation to address interstate transport and we therefore found those states were determined to make insignificant contributions to downwind air quality. Therefore, the states below the threshold do not significantly contribute to nonattainment or interfere with maintenance of the NAAQS in other states. EPA used the 1% threshold in the East because prior analysis showed that, in general, nonattainment problems result from a combined impact of relatively small individual contributions from upwind states, along with contributions from in-state sources. EPA has observed that a relatively large portion of the air quality problem at most ozone nonattainment and maintenance receptors in the East is the result of the collective contribution from a number of upwind states.

Specifically, EPA found the total upwind states' contribution to ozone concentration (from linked and unlinked states) based on modeling for 2017 ranges from 17% to 67% to identified downwind air quality problems in the East, with between 4 and 12 states each contributing above 1% to the downwind air quality problem.[15] [16] Thus, irrespective of the 1% air quality threshold in the East, EPA has found that the collective contributions from upwind states represent a large portion of the ozone concentrations at projected air quality problems. Further, in the East, EPA found that the 1% threshold is appropriate to capture a high percentage of the total pollution transport affecting downwind receptors. By comparison, according to EPA's modeling, the total upwind (linked or unlinked) states' contribution to ozone concentration at the projected nonattainment sites in El Centro, California and Los Angeles, California, is comparatively small, with only one state contributing above 1% to the downwind air quality problem.

Arizona is the only state that contributes greater than the 1% threshold to the projected 2017 levels of the 2008 ozone NAAQS at the El Centro receptor. The total contribution from all states to the El Centro receptor is 4.4% of the total ozone concentration at this receptor. Arizona is also the only state that contributes greater than 1% to the projected 2017 levels of the 2008 ozone NAAQS at the Los Angeles receptor, and the total contribution from all states is 2.5% of the ozone concentration at this receptor. EPA believes that a 4.4% and 2.5% cumulative ozone contribution from all upwind states is negligible, particularly when compared to the relatively large contributions from upwind states in the East or in certain other areas of the West. For these reasons, EPA believes the emissions that result in transported ozone from upwind states have limited impacts on the projected air quality problems in El Centro, California and Los Angeles, California, and therefore should not be treated as receptors for purposes of determining the interstate transport obligations of upwind states under section 110(a)(2)(D)(i)(I).

Additionally, EPA has evaluated the Arizona VOC and NO_X emissions inventory and emissions projections and agrees that emissions will be decreasing over time. Given that emissions within the state are expected to decrease over time due to regional haze measures, Federal engine and fuel standards, and other Federal, State, and local rules,[17] EPA believes that the Arizona SIP contains adequate provisions to ensure that air emissions in Arizona do not significantly contribute to nonattainment or interfere with maintenance of the 2008 ozone NAAQS in California or any other state in the future.

The modeling data show that Arizona contributes either less than 1% of the NAAQS to projected air quality problems in other states, or where it contributes above 1% of the NAAQS to a projected downwind air quality problem in California, EPA proposes to find, based on the overall weight of evidence, that these particular receptors are not significantly impacted by transported ozone from upwind states. Emissions reductions from Arizona are not necessary to address interstate transport because the total collective upwind state ozone contribution to these receptors is relatively low compared to the air quality problems typically addressed by the good neighbor provision. Additionally, Arizona has demonstrated that both VOC and NO_X emissions are going down and will continue to go down. EPA therefore believes that Arizona's contributions to downwind receptors in California are considered insignificant. EPA proposes to find that Arizona does not significantly contribute to nonattainment or interfere with maintenance of the 2008 ozone NAAQS in other states.

110(a)(2)(D)(i)(II) Prong 4

EPA believes that ozone precursor emissions of NO_X may contribute to visibility impairment in Class I areas. EPA's 2013 I–SIP guidance clarifies that a state can rely upon a fully EPA-approved Regional Haze SIP to satisfy the requirements of this sub-element. Arizona's Regional Haze SIP shows that sources in Arizona impact visibility in Colorado (Great Sand Dunes National Monument, Mesa Verde National Park, Black Canyon of the Gunnison National Park, La Garita Wilderness, and Weminuche Wilderness), New Mexico (Bandelier National Monument, San Pedro Parks Wilderness, Pecos Wilderness, Bosque del Apache National Wildlife Reserve, and Gila Wilderness), and Utah (Zion National Park, Bryce Canyon National Park, Capitol Reef National Park, Canyonlands National Park, and Arches

[15] The stated range is based on the highest nonattainment or maintenance receptor in each area. All nonattainment and maintenance receptors had upwind contributions of well over 17%, except for some receptors in Dallas and Houston.

[16] Memo to Docket from EPA, Air Quality Policy Division. "Contribution Analysis of Receptors in the Updated CSAPR Proposal." March 10, 2016.

[17] See TSD for details on other emissions control measures.

NMED Exhibit 7h

National Park).[18] Arizona's Regional Haze SIP is not fully approved by EPA. Instead, Arizona's 2012 and 2015 submittals rely, in part, on regulations imposed by FIPs to address visibility impairment in Class 1 Areas caused by NO_X, SO_2, and PM. These regulations include emission limits on the following facilities: Arizona Public Service Cholla Power Plant,[19] Salt River Project Coronado Generating Station,[20] Freeport McMoran Miami Smelter,[21] ASARCO Hayden Smelter,[22] Sundt Generating Station Unit 4,[23] and Nelson Lime Plant Kilns 1 and 2.[24] Emissions limits have been incorporated into the state SIP, replacing a previous FIP, at AEPCO Apache Station Units 1, 2, and 3.[25]

Because Arizona's 2012 and 2015 submittals rely in part on FIPs to address interstate transport visibility requirements, they do not meet the requirements of prong 4 for the 2008 ozone NAAQS. However, because FIPs are already in place, no additional FIP obligation would be triggered by a final disapproval of this portion of Arizona's infrastructure SIP. EPA will continue to work with Arizona to incorporate emission limits to address the requirements of the Regional Haze Rule into the Arizona SIP. For further discussion of our analysis of prong 4, please see the TSD associated with this proposal and in the docket for today's rulemaking.

IV. Proposed Action

EPA is proposing to approve Arizona's SIP as meeting the interstate transport requirements of CAA section 110(a)(2)(D)(i)(I) prongs 1 and 2 for the 2008 ozone NAAQS. EPA is proposing this approval based on the overall weight of evidence from information and analysis provided by Arizona, as well as the recent air quality modeling released in EPA's August 4, 2015 NODA, and other data analysis that confirms that emissions from Arizona will not contribute significantly to nonattainment or interfere with maintenance of the 2008 ozone NAAQS in California or any other state.

EPA is proposing to disapprove Arizona's SIP with respect to the interstate transport requirements of CAA section 110(a)(2)(D)(i)(II) prong 4 for the 2008 ozone NAAQS. Because Arizona's 2012 and 2015 submittals rely, in part, on FIPs to address interstate transport visibility requirements, they do not meet the requirements of this portion of CAA § 110(a)(2)(D) for the 2008 ozone NAAQS. However, because FIPs are already in place, no additional FIP obligation would be triggered by a final disapproval of this portion of Arizona's infrastructure SIP. EPA will continue to work with Arizona to incorporate emission limits to address the requirements of the Regional Haze Rule into the Arizona SIP.

V. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *http://www2.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was therefore not submitted to the Office of Management and Budget (OMB) for review.

B. Paperwork Reduction Act (PRA)

This action does not impose an information collection burden under the PRA because this action does not impose additional requirements beyond those imposed by state law.

C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities beyond those imposed by state law.

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. This action does not impose additional requirements beyond those imposed by state law. Accordingly, no additional costs to State, local, or tribal governments, or to the private sector, will result from this action.

E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175: Coordination With Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175, because the SIP is not approved to apply on any Indian reservation land or in any other area where the EPA or an Indian tribe has demonstrated that a tribe has jurisdiction, and will not impose substantial direct costs on tribal governments or preempt tribal law. Thus, Executive Order 13175 does not apply to this action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of "covered regulatory action" in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not impose additional requirements beyond those imposed by state law.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act (NTTAA)

Section 12(d) of the NTTAA directs the EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. The EPA believes that this action is not subject to the requirements of section 12(d) of the NTTAA because application of those requirements would be inconsistent with the CAA.

[EPA–R04–OAR–2015–0798; FRL–9943–88–Region 4]

Air Plan Disapprovals; MS; Prong 4–2008 Ozone, 2010 NO_2, SO_2, and 2012 $PM_{2.5}$

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) is proposing to disapprove the visibility transport (prong 4) portions of revisions to the Mississippi State Implementation Plan (SIP), submitted by the Mississippi Department of Environmental Quality (MDEQ), addressing the Clean Air Act (CAA or Act) infrastructure SIP requirements for the 2008 8-hour Ozone, 2010 1-hour Nitrogen Dioxide (NO_2), 2010 1-hour Sulfur Dioxide (SO_2), and 2012 annual Fine Particulate Matter ($PM_{2.5}$) National Ambient Air Quality Standards (NAAQS). The CAA requires that each state adopt and submit a SIP for the implementation, maintenance, and enforcement of each NAAQS promulgated by EPA, commonly referred to as an ''infrastructure SIP.'' Specifically, EPA is proposing to disapprove the prong 4 portions of Mississippi's May 29, 2012, 2008 8-hour Ozone infrastructure SIP submission; July 26, 2012, 2008 8-hour Ozone infrastructure SIP resubmission; February 28, 2013, 2010 1-hour NO_2 infrastructure SIP submission; June 20, 2013, 2010 1-hour SO_2 infrastructure SIP submission; and December 8, 2015, 2012 annual $PM_{2.5}$ infrastructure SIP submission. All other applicable infrastructure requirements for these SIP submissions have been or will be addressed in separate rulemakings.

DATES: Comments must be received on or before April 21, 2016.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–R04–OAR–2015–0798 at *http://www.regulations.gov.* Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from Regulations.gov. EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.,* on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *http://www2.epa.gov/dockets/commenting-epa-dockets.*

FOR FURTHER INFORMATION CONTACT: Sean Lakeman of the Air Regulatory Management Section, Air Planning and Implementation Branch, Air, Pesticides and Toxics Management Division, U.S. Environmental Protection Agency, Region 4, 61 Forsyth Street SW., Atlanta, Georgia 30303–8960. Mr. Lakeman can be reached by telephone at (404) 562–9043 or via electronic mail at *lakeman.sean@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. Background

By statute, SIPs meeting the requirements of sections 110(a)(1) and (2) of the CAA are to be submitted by states within three years after promulgation of a new or revised NAAQS to provide for the implementation, maintenance, and enforcement of the new or revised NAAQS. EPA has historically referred to these SIP submissions made for the purpose of satisfying the requirements of sections 110(a)(1) and 110(a)(2) as ''infrastructure SIP'' submissions. Sections 110(a)(1) and (2) require states to address basic SIP elements such as for monitoring, basic program requirements, and legal authority that are designed to assure attainment and maintenance of the newly established or revised NAAQS. More specifically, section 110(a)(1) provides the procedural and timing requirements for infrastructure SIPs. Section 110(a)(2) lists specific elements that states must meet for the infrastructure SIP requirements related to a newly established or revised NAAQS. The contents of an infrastructure SIP submission may vary depending upon the data and analytical tools available to the state, as well as the provisions already contained in the state's implementation plan at the time in which the state develops and submits the submission for a new or revised NAAQS.

Section 110(a)(2)(D) has two components: 110(a)(2)(D)(i) and 110(a)(2)(D)(ii). Section 110(a)(2)(D)(i) includes four distinct components, commonly referred to as ''prongs,'' that must be addressed in infrastructure SIP submissions. The first two prongs, which are codified in section 110(a)(2)(D)(i)(I), are provisions that prohibit any source or other type of emissions activity in one state from contributing significantly to nonattainment of the NAAQS in another state (prong 1) and from interfering with maintenance of the NAAQS in another state (prong 2). The third and fourth prongs, which are codified in section 110(a)(2)(D)(i)(II), are provisions that prohibit emissions activity in one state from interfering with measures required to prevent significant deterioration of air quality in another state (prong 3) or from interfering with measures to protect visibility in another state (prong 4). Section 110(a)(2)(D)(ii) requires SIPs to include provisions insuring compliance with sections 115 and 126 of the Act, relating to interstate and international pollution abatement.

Through this action, EPA is proposing to disapprove the prong 4 portions of Mississippi's infrastructure SIP submissions for the 2008 8-hour Ozone, 2010 1-hour NO_2, 2010 1-hour SO_2, and 2012 annual $PM_{2.5}$ NAAQS. All other applicable infrastructure SIP requirements for these SIP submissions have been or will be addressed in separate rulemakings. A brief background regarding the NAAQS relevant to today's proposal is provided below. For comprehensive information on these NAAQS, please refer to the **Federal Register** notices cited in the following subsections.

a. 2008 8-Hour Ozone NAAQS

On March 12, 2008, EPA revised the 8-hour Ozone NAAQS to 0.075 parts per million. *See* 73 FR 16436 (March 27, 2008). States were required to submit infrastructure SIP submissions for the

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[EPA–R09–OAR–2015–0793; FRL–9946–58–Region 9]

Partial Approval and Partial Disapproval of Air Quality State Implementation Plans; Arizona; Infrastructure Requirements To Address Interstate Transport for the 2008 Ozone NAAQS

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The Environmental Protection Agency (EPA) is approving in part and disapproving in part State Implementation Plan (SIP) revisions submitted by the Arizona Department of Environmental Quality to address the interstate transport requirements of Clean Air Act (CAA or Act) section 110(a)(2)(D)(i) with respect to the 2008 ozone national ambient air quality standard (NAAQS). We are approving the portion of the Arizona SIP pertaining to significant contribution to nonattainment or interference with maintenance in another state and disapproving the portion of Arizona's SIP pertaining to interstate transport visibility requirements. Where EPA is disapproving a portion of the Arizona SIP revision, the deficiencies have already been addressed by a federal implementation plan (FIP).

DATES: This final rule is effective on June 20, 2016.

ADDRESSES: EPA has established docket number EPA–R09–OAR–2015–0793 for this action. Generally, documents in the docket for this action are available electronically at *http://www.regulations.gov* or in hard copy at EPA Region IX, 75 Hawthorne Street, San Francisco, California 94105–3901. While all documents in the docket are listed at *http://www.regulations.gov,* some information may be publicly available only at the hard copy location (*e.g.,* copyrighted material, large maps, multi-volume reports), and some may not be available in either location (*e.g.,* confidential business information (CBI)). To inspect the hard copy materials, please schedule an appointment during normal business hours with the contact listed in the **FOR FURTHER INFORMATION CONTACT** section.

FOR FURTHER INFORMATION CONTACT: Tom Kelly, Air Planning Office (AIR–2), U.S. Environmental Protection Agency, Region IX, (415) 972–3856, *kelly.thomasp@epa.gov.*

SUPPLEMENTARY INFORMATION: Throughout this document, the terms ''we,'' ''us,'' and ''our'' refer to EPA.

Table of Contents

I. Background

CAA sections 110(a)(1) and (2) require states to address basic SIP requirements to implement, maintain and enforce the NAAQS no later than three years after the promulgation of a new or revised standard. Section 110(a)(2) outlines the specific requirements that each state is required to address in this SIP submission that collectively constitute the ''infrastructure'' of a state's air quality management program. SIP submittals that address these requirements are referred to as ''infrastructure SIPs'' (I–SIP). In particular, CAA section 110(a)(2)(D)(i)(I) requires that each SIP for a new or revised NAAQS contain adequate provisions to prohibit any source or other type of emissions activity within the state from emitting air pollutants that will ''contribute significantly to nonattainment'' (prong 1) or ''interfere with maintenance'' (prong 2) of the applicable air quality standard in any other state. CAA section 110(a)(2)(D)(i)(II) requires SIP provisions that prevent interference with measures required to be included in the applicable implementation plan for any other State under part C to prevent significant deterioration of air quality (prong 3) or to protect visibility (prong 4). This action addresses the section 110(a)(2)(D)(i) requirements of prongs 1, 2 and 4 with respect to Arizona's I–SIP submissions.

On March 27, 2008, EPA issued a revised NAAQS for ozone.[1] This action triggered a requirement for states to submit an I–SIP to address the applicable requirements of section 110(a)(2) within three years of issuance of the revised NAAQS. On December 27, 2012, the Arizona Department of Environmental Quality (ADEQ) submitted its 2008 ozone NAAQS I–SIP. On December 3, 2015, ADEQ submitted a supplement to the 2012 submittal further addressing 110(a)(2)(D)(i) prongs 1, 2, and 4.[2]

On July 14, 2015, EPA partially approved and partially disapproved Arizona's 2012 submittal for the 2008 ozone NAAQS for the I–SIP elements C, D, J, and K. EPA partially approved and partially disapproved the submittal for purposes of 110(a)(2)(D)(i)(II) prong 3 and partially approved and partially disapproved the submittal for purposes of 110(a)(2)(D)(ii) (relating to CAA sections 115 and 126).[3] We subsequently took action on I–SIP elements A, B, E–H, L, and M for the 2008 ozone NAAQS on August 10, 2015.[4] We also stated our intention to propose action on the I–SIP submittal for the 2008 ozone NAAQS 110(a)(2)(D)(i) prongs 1, 2, and 4 in an additional action.[5] Additionally, pursuant to a judgment issued by the Northern District of California in *Sierra Club* vs. *McCarthy,* EPA must take final action on 110(a)(2)(D) prongs 1, 2, and 4 of Arizona's December 2012 SIP revision by June 7, 2016.[6]

On March 22, 2016, EPA proposed to approve in part, and disapprove in part, the 2012 and 2015 SIP revisions addressing the infrastructure requirements of CAA section 110(a)(2)(D)(i) for the 2008 ozone NAAQS.[7] The rationale supporting EPA's actions is explained in our proposal notice and the associated TSD and will not be restated here. The proposed rule and TSD are available online at *http://www.regulations.gov,* Docket ID number EPA–R09–OAR–2015–0793.

II. Public Comments

EPA received no comments on the proposed action during the public comment period.

III. Final Action

Under CAA section 110(k)(3), and based on the evaluation and rationale presented in the proposed rule, the related TSD, and this final rule, EPA is approving in part and disapproving in part Arizona SIP revisions addressing the interstate transport requirements of CAA section 110(a)(2)(D) with respect to the 2008 ozone NAAQS.

EPA is approving Arizona's SIP as meeting the interstate transport requirements of CAA section 110(a)(2)(D)(i)(I) prongs 1 and 2 for the 2008 ozone NAAQS. EPA is disapproving Arizona's SIP with respect to the interstate transport requirements of CAA section 110(a)(2)(D)(i)(II) prong 4 for the 2008 ozone NAAQS. However, because EPA has issued Regional Haze FIPs addressing visibility requirements in Arizona, no additional FIP obligation is triggered by the disapproval of this portion of Arizona's infrastructure SIP. EPA will continue to work with Arizona to incorporate emission limits to address the requirements of the Regional Haze Rule into the state SIP.

IV. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *http://www2.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was therefore not submitted to the Office of Management and Budget (OMB) for review.

B. Paperwork Reduction Act (PRA)

This action does not impose an information collection burden under the PRA because this action does not impose additional requirements beyond those imposed by state law.

C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities beyond those imposed by state law.

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. This action does not impose additional requirements beyond those imposed by state law. Accordingly, no additional costs to State, local, or tribal governments, or to the private sector, will result from this action.

E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

[5] *Id.*

[6] Judgment, Sierra Club v. McCarthy, Case 4:14–cv–05091–YGR (N.D. Cal. May 15, 2015).

[7] Partial Approval and Partial Disapproval of Air Quality State Implementation Plans; Arizona; Infrastructure Requirements to Address Interstate Transport for the 2008 Ozone NAAQS. 81 FR 1520. (March 22, 2016).

NMED Exhibit 7i

F. Executive Order 13175: Coordination With Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175, because the SIP is not approved to apply on any Indian reservation land or in any other area where the EPA or an Indian tribe has demonstrated that a tribe has jurisdiction, and will not impose substantial direct costs on tribal governments or preempt tribal law. Thus, Executive Order 13175 does not apply to this action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of ''covered regulatory action'' in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not impose additional requirements beyond those imposed by state law.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act (NTTAA)

Section 12(d) of the NTTAA directs the EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. The EPA believes that this action is not subject to the requirements of section 12(d) of the NTTAA because application of those requirements would be inconsistent with the CAA.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Population

The EPA lacks the discretionary authority to address environmental justice in this rulemaking.

K. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

L. Petitions for Judicial Review

Under section 307(b)(1) of the Clean Air Act, petitions for judicial review of this action must be filed in the United States Court of Appeals for the appropriate circuit by July 18, 2016. Filing a petition for reconsideration by the Administrator of this final rule does not affect the finality of this rule for the purposes of judicial review nor does it extend the time within which a petition for judicial review may be filed, and shall not postpone the effectiveness of such rule or action. This action may not be challenged later in proceedings to enforce its requirements (see section 307(b)(2)).

List of Subjects in 40 CFR Part 52

Environmental protection, Air pollution control, Approval and promulgation of implementation plans, Incorporation by reference, Oxides of nitrogen, Ozone, and Volatile organic compounds.

Dated: May 6, 2016.

RIN 2060–AS86

Technical Amendments to Performance Specification 18 and Procedure 6

AGENCY: Environmental Protection Agency (EPA).

ACTION: Direct final rule.

SUMMARY: The Environmental Protection Agency (EPA) is taking direct final action to make several minor technical amendments to the performance specifications and test procedures for hydrogen chloride (HCl) continuous emission monitoring systems (CEMS). This direct final rule also makes several minor amendments to the quality assurance (QA) procedures for HCl CEMS used for compliance determination at stationary sources. The performance specification (Performance Specification 18) and the QA procedures (Procedure 6) were published in the **Federal Register** on July 7, 2015. These amendments make several minor corrections and clarify several aspects of these regulations.

DATES: This rule is effective on August 17, 2016 without further notice, unless the EPA receives adverse comment by July 5, 2016. If the EPA receives adverse comment, we will publish a timely withdrawal in the **Federal Register** informing the public that the rule will not take effect.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–HQ–OAR–2013–0696, at *http://www.regulations.gov*. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from *Regulations.gov*. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.,* on the Web, Cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *http://www2.epa.gov/dockets/commenting-epa-dockets*.

FOR FURTHER INFORMATION CONTACT: Ms. Candace Sorrell, U.S. EPA, Office of Air Quality Planning and Standards, Air Quality Assessment Division, Measurement Technology Group (Mail Code: E143–02), Research Triangle Park, NC 27711; telephone number: (919) 541–1064; fax number: (919) 541–0516; email address: *sorrell.candace@epa.gov*.

SUPPLEMENTARY INFORMATION: The information presented in this rule is organized as follows:

and local ventilation) or administrative control measures (*e.g.,* workplace policies and procedures) shall be considered and implemented to prevent exposure, where feasible.

(ii) *Hazard communication.* Requirements as specified in § 721.72(a) through (e) (concentration set at 1.0%), (f), (g)(1)(i), (ii) and (iv), (2)(i), (ii) and (v), (3)(i) and (ii), (4)(iii) (above concentration of 1 part per billion (ppb), and (5). Alternative hazard and warning statements that meet the criteria of the Globally Harmonized System and OSHA Hazard Communication Standard may be used.

(iii) *Industrial, commercial, and consumer activities.* Requirements as specified in § 721.80(g). It is a significant new use to manufacture, process, or use the substance that results in inhalation exposure. It is a significant new use to manufacture, process and use the substance other than as stated in the PMN.

(iv) *Disposal.* Residuals must be recycled back into the process as stated in the PMN.

(v) *Release to water.* Requirements as specified in § 721.90(a)(4), (b)(4), (c)(4), where N=1.

(b) *Specific requirements.* The provisions of subpart A of this part apply to this section except as modified by this paragraph (b).

(1) *Recordkeeping.* Recordkeeping requirements as specified in § 721.125(a) through (k) are applicable to manufacturers and processors of this substance.

(2) *Limitations or revocation of certain notification requirements.* The provisions of § 721.185 apply to this section.

(3) *Determining whether a specific use is subject to this section.* The provisions of § 721.1725(b)(1) apply to paragraphs (a)(2)(iii) and (iv) of this section.

§ 721.11246 Substituted alkanediol, polymer with heteromonocycles, alkenoate, metal complexes (generic).

(a) Chemical substance and significant new uses subject to reporting. (1) The chemical substance identified generically as substituted alkanediol, polymer with heteromonocycles, alkenoate, metal complexes (PMN P– 18–130) is subject to reporting under this section for the significant new uses described in paragraph (a)(2) of this section. The requirements of this section do not apply to quantities of the substance after they have been reacted (cured).

(2) The significant new uses are:

(i) Protection in the workplace. Requirements as specified in § 721.63(a)(1), (2)(i) and (iii), (3) through (5) and (6)(v) and (vi) (particulate), and (c). When determining which persons are reasonably likely to be exposed as required for § 721.63(a)(1) and (4) engineering control measures (*e.g.,* enclosure or confinement of the operation, general and local ventilation) or administrative control measures (*e.g.,* workplace policies and procedures) shall be considered and implemented to prevent exposure, where feasible. For § 721.63(a)(5), respirators must provide a National Institute for Occupational Safety and Health assigned protection factor (APF) of at least 50, or if spray applied an APF of 1000.

(ii) *Hazard communication.* Requirements as specified in § 721.72(a) through (d), (f), (g)(1)(i) ((sensitization), (mutagenicity)), (2)(i) through (v), and (5). Alternative hazard and warning statements that meet the criteria of the Globally Harmonized System and OSHA Hazard Communication Standard may be used.

(iii) *Industrial, commercial, and consumer activities.* Requirements as specified in § 721.80(f). It is a significant new use to use the substance other than as an adhesion promoter for industrial applications.

(b) *Specific requirements.* The provisions of subpart A of this part apply to this section except as modified by this paragraph (b).

(1) *Recordkeeping.* Recordkeeping requirements as specified in § 721.125(a) through (i) are applicable to manufacturers and processors of this substance.

(2) *Limitations or revocation of certain notification requirements.* The provisions of § 721.185 apply to this section.

[EPA–HQ–OAR–2019–0603; FRL–10002–78–OAR]

Findings of Failure To Submit a Clean Air Act Section 110 State Implementation Plan for Interstate Transport for the 2015 Ozone National Ambient Air Quality Standards (NAAQS)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final action.

SUMMARY: The Environmental Protection Agency (EPA) is taking final action finding that seven states have failed to submit infrastructure State Implementation Plans (SIPs) to satisfy certain interstate transport requirements of the Clean Air Act (CAA) with respect to the 2015 8-hour ozone national ambient air quality standards (NAAQS). Specifically, these requirements pertain to prohibiting significant contribution to nonattainment, or interference with maintenance, of the 2015 8-hour ozone NAAQS in other states. These findings of failure to submit establish a 2-year deadline for the EPA to promulgate Federal Implementation Plans (FIPs) to address these interstate transport requirements for a given state unless, prior to the EPA promulgating a FIP, the state submits, and the EPA approves, a SIP that meets these requirements.

DATES: Effective date of this action is January 6, 2020.

FOR FURTHER INFORMATION CONTACT: General questions concerning this document should be addressed to Mr. Thomas Uher, Office of Air Quality Planning and Standards, Air Quality Policy Division, Mail Code C539–04, 109 TW Alexander Drive, Research Triangle Park, NC 27711; telephone (919) 541–5534; email: *uher.thomas@epa.gov*.

SUPPLEMENTARY INFORMATION:

I. General Information

A. Notice and Comment Under the Administrative Procedures Act (APA)

Section 553 of the APA, 5 U.S.C. 553(b)(3)(B), provides that, when an agency for good cause finds that notice and public procedure are impracticable, unnecessary, or contrary to the public interest, the agency may issue a rule without providing notice and an opportunity for public comment. The EPA has determined that there is good cause for making this final agency action without prior proposal and opportunity for comment because no significant EPA judgment is involved in making a finding of failure to submit SIPs, or elements of SIPs, required by the CAA, where states have made no submissions or incomplete submissions, to meet the requirement. Thus, notice and public procedure are unnecessary. The EPA finds that this constitutes good cause under 5 U.S.C. 553(b)(3)(B).

B. How can I get copies of this document and other related information?

The EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2019–0603. All documents in the docket are listed and publicly available at *http://www.regulations.gov*. Publicly available docket materials are also available in hard copy at the Air and Radiation Docket and Information

Center, EPA/DC, William Jefferson Clinton West Building, Room 3334, 1301 Constitution Avenue NW, Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744 and the telephone number for the Office of Air and Radiation Docket and Information Center is (202) 566–1742. For additional information about the EPA's public docket, visit the EPA Docket Center homepage at: *http://www.epa.gov/epahome/dockets.htm*.

C. How is the preamble organized?

Table of Contents

D. Where do I go if I have state specific questions?

The table below lists the states that failed to make a complete interstate transport SIP submittal addressing CAA section 110(a)(2)(D)(i)(I) requirements for the 2015 ozone NAAQS. For questions related to specific states mentioned in this document, please contact the appropriate EPA Regional office:

Regional offices	States
EPA Region 1: Alison Simcox, Manager, Air Quality Branch, EPA Region I, 5 Post Office Square, Suite 100, Boston, MA 02109–3912.	Maine, Rhode Island.
EPA Region 3: Joseph Schulingkamp, Air Protection Division, EPA Region III, 1650 Arch Street, Philadelphia, PA 19103–2187.	Pennsylvania, Virginia.
EPA Region 6: Mary Stanton, Chief, Infrastructure and Ozone Section, EPA Region VI, 1201 Elm Street, Suite 500, Dallas, TX 75270.	New Mexico.
EPA Region 8: Adam Clark, EPA Region VIII, Air and Radiation Division, 1595 Wynkoop St., Denver, CO 80202.	South Dakota, Utah.

II. Background and Overview

A. Interstate Transport SIPs

CAA section 110(a) imposes an obligation upon states to submit SIPs that provide for the implementation, maintenance, and enforcement of a new or revised NAAQS within 3 years following the promulgation of that NAAQS. CAA section 110(a)(2) lists specific requirements that states must meet in these SIP submissions, as applicable. The EPA refers to this type of SIP submission as an ''infrastructure'' SIP because it ensures that states can implement, maintain and enforce the new or revised air standards. Within these requirements, CAA section 110(a)(2)(D)(i) contains requirements to address interstate transport of NAAQS pollutants. A SIP revision submitted for this sub-section is referred to as an ''interstate transport SIP.'' In turn, CAA section 110(a)(2)(D)(i)(I) requires that such a plan contain adequate provisions to prohibit emissions from the state that will contribute significantly to nonattainment of the NAAQS in any other state (''prong 1'') or interfere with maintenance of the NAAQS in any other state (''prong 2''). Interstate transport prongs 1 and 2, also called collectively the ''good neighbor'' provision, are the requirements relevant to this findings document.

Pursuant to CAA section 110(k)(1)(B), the EPA must determine no later than 6 months after the date by which a state is required to submit a SIP whether a state has made a submission that meets the minimum completeness criteria established pursuant to CAA section 110(k)(1)(A). These criteria are set forth at 40 CFR part 51, appendix V. The EPA refers to the determination that a state has not submitted a SIP submission that meets the minimum completeness criteria as a ''finding of failure to submit.'' If the EPA finds a state has failed to submit a SIP to meet its statutory obligation to address CAA section 110(a)(2)(D)(i)(I), then pursuant to CAA section 110(c)(1), the EPA has not only the authority, but the obligation, to promulgate a FIP within 2 years to address the CAA requirement. This finding, therefore, starts a 2-year ''clock'' for promulgation by the EPA of a FIP, in accordance with CAA section 110(c)(1), unless prior to such promulgation the state submits, and the EPA approves, a submittal from the state to meet the requirements of CAA section 110(a)(2)(D)(i)(I). Even where the EPA has promulgated a FIP, the EPA will withdraw that FIP if a state submits and the EPA approves a SIP satisfying the relevant requirements. The EPA notes this action does not start a mandatory sanctions clock pursuant to CAA section 179 because this finding of failure to submit does not pertain to a part D plan for nonattainment areas required under CAA section 110(a)(2)(I) or a SIP call pursuant to CAA section 110(k)(5).

B. Background on 2015 Ozone NAAQS and Related Matters

On October 1, 2015, the EPA promulgated a new 8-hour primary and secondary ozone NAAQS of 70 parts per billion (ppb), which is met when the 3-year average of the annual fourth highest daily maximum 8-hour concentration does not exceed 70 ppb.[1] Pursuant to the 3-year period provided in CAA section 110(a)(1), infrastructure SIPs addressing the revised standard were due on October 1, 2018.

On September 5, 2019, the EPA announced via its website its intention to make findings that certain states have failed to submit complete interstate

[1] *See* Final Rule, National Ambient Air Quality Standards for Ozone, 80 FR 65292 (October 26, 2015).

NMED Exhibit 7j

transport SIPs for the 2015 ozone NAAQS by November 22, 2019.[2]

On September 30, 2019, the Sierra Club filed a complaint in the United States District Court for the District of Columbia (D.C. District Court) alleging that the EPA had not fulfilled its mandatory duty to make findings of failure to submit interstate transport SIPs pursuant to CAA section 110(a)(2)(D)(i)(I) with respect to the 2015 ozone NAAQS for twelve states: Arkansas, Hawaii, Louisiana, Maine, Maryland, Mississippi, New Mexico, Pennsylvania, Rhode Island, Utah, Vermont, and Virginia.[3] On October 29, 2019, the States of New Jersey and Connecticut filed a complaint in the D.C. District Court alleging that the EPA had not fulfilled its mandatory duty to make findings of failure to submit interstate transport SIPs addressing interstate transport in CAA section 110(a)(2)(D)(i)(I) with respect to the 2015 ozone NAAQS for two states: Virginia and Pennsylvania.[4]

To fulfill its statutory obligations, the EPA is taking this action for all states that have failed to submit complete SIPs addressing CAA section 110(a)(2)(D)(i)(I) for the 2015 ozone NAAQS, not just those states named in the complaints. As explained below, in total, seven states have failed to submit complete SIPs while forty-three states and the District of Columbia have submitted complete SIPs addressing CAA section 110(a)(2)(D)(i)(I) for the 2015 ozone NAAQS.

The EPA has included in the docket for this action its correspondence with states regarding the completeness of their SIP submissions. SIPs may be considered complete by either of two methods. First, the EPA may make a determination that a SIP is complete under the ''completeness criteria'' set out at 40 CFR part 51, appendix V. *See* CAA section 110(k)(1). Second, a SIP may be deemed complete by operation of law if the EPA has failed to make such a determination by 6 months after receipt of the SIP submission. *See* CAA section 110(k)(1)(B).

Five states failed to make any SIP submittal addressing interstate transport for the 2015 ozone NAAQS: Maine, New Mexico, Pennsylvania, Rhode Island, and Virginia. All of these states were identified in the Sierra Club complaint.

The EPA has evaluated the SIP submittals of two states, South Dakota and Utah, for completeness pursuant to the criteria in 40 CFR part 51, appendix V, and concluded that these are incomplete SIP submissions.[5] On November 21, 2019, the EPA sent letters to these two states explaining our incompleteness determination. These letters are included in the docket for this action. As explained in those letters, the completeness criteria under 40 CFR part 51, appendix V, section 2.1(g), require a certification that public hearing(s) were held in accordance with the information provided in the state's public notice and the State's laws and constitution, if applicable and consistent with the public hearing requirements in 40 CFR 51.102. Under § 51.102(a), states must either hold a public hearing or provide the public the opportunity to request a public hearing. South Dakota and Utah did not provide the necessary certification under section 2.1(g) of appendix V that a public hearing was held or that they had provided the opportunity for the public to request a public hearing in accordance with 40 CFR 51.102(a). As a result, the EPA determined that these SIP submissions are incomplete. Where the EPA determines that a SIP submission does not meet the appendix V completeness criteria, ''the State shall be treated as not having made the submission............'' CAA section 110(k)(1)(C). Accordingly, the EPA is finding in this document that South Dakota and Utah have failed to submit complete SIP revisions addressing CAA section 110(a)(2)(D)(i)(I) as to the 2015 ozone NAAQS. These states may, if they choose, resubmit to the EPA complete SIPs, which the EPA will review and act upon at a later date.

In all other cases, the EPA has determined that the SIP submittals are complete or they have been deemed complete by operation of law. In particular, the six remaining states identified in Sierra Club's complaint filed in the D.C. District Court have made complete SIP submittals addressing the good neighbor provision for the 2015 ozone NAAQS: Arkansas, Hawaii, Louisiana, Maryland, Mississippi, and Vermont. As a result, there is no longer a basis to make findings of failure to submit for these states.

The EPA is issuing national findings of failure to submit interstate transport SIPs addressing the requirements of CAA section 110(a)(2)(D)(i)(I) as to the 2015 ozone NAAQS, for all states that have not made complete submissions as of the date of this document.

III. Findings of Failure To Submit for States That Failed To Make an Interstate Transport SIP Submission for the 2015 Ozone NAAQS

The EPA is making findings of failure to submit for seven states. The EPA finds the following states have not submitted complete interstate transport SIPs to meet the requirements of CAA section 110(a)(2)(D)(i)(I) for the 2015 ozone NAAQS: Maine, New Mexico, Pennsylvania, Rhode Island, South Dakota, Utah, and Virginia. Notwithstanding these findings, and the associated obligation of the EPA to promulgate FIPs for these states within two years of this finding, the EPA intends to continue to work with states subject to these findings in order to provide assistance as necessary to help them develop approvable SIP submittals in a timely manner.

IV. Environmental Justice Considerations

This document is making a procedural finding that certain states have failed to submit a SIP to address CAA section 110(a)(2)(D)(i)(I) for the 2015 ozone NAAQS. The EPA did not conduct an environmental analysis for this action because it would not directly affect the air emissions of particular sources. Because this action will not directly affect the air emissions of particular sources, it does not affect the level of protection provided to human health or the environment. Therefore, this action will not have potential disproportionately high and adverse human health or environmental effects on minority, low-income or indigenous populations.

V. Statutory and Executive Order Reviews

A. Executive Orders 12866: Regulatory Planning and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not an Executive Order 13771 regulatory action because it finds that seven states failed to submit a SIP to meet their statutory obligation to address CAA section 110(a)(2)(D)(i)(I) for the 2015 ozone NAAQS.

C. Paperwork Reduction Act

This action does not impose an information collection burden under the

[2] U.S. EPA, Interstate Air Pollution Transport, *https://www.epa.gov/airmarkets/interstate-air-pollution-transport.*

[3] Complaint, *Sierra Club* v. *Wheeler,* No. 1:19–cv–02923 (D.D.C. filed Sept. 30, 2019).

[4] Complaint, *State of New Jersey* v. *Wheeler,* No. 1:19–cv–03247 (D.D.C. filed Oct. 29, 2019).

[5] Utah was identified in the Sierra Club complaint, but South Dakota was not.

NMED Exhibit 7j

provisions of the Paperwork Reduction Act. This final action does not establish any new information collection requirement apart from what is already required by law. This finding relates to the requirement in the CAA for states to submit SIPs under section 110(a)(2)(D)(i)(I) of the CAA for the 2015 ozone NAAQS.

D. Regulatory Flexibility Act (RFA)

This action is not subject to the RFA. The RFA applies only to rules subject to notice and comment rulemaking requirements under the Administrative Procedure Act (APA), 5 U.S.C. 553 or any other statute. This action is not subject to notice and comment requirements because the agency has invoked the APA ''good cause'' exemption under 5 U.S.C. 553(b). I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities. The action is a finding that the named states have not made the necessary SIP submission for interstate transport to meet the requirements under section 110(a)(2)(D)(i)(I) of the CAA.

E. Unfunded Mandates Reform Act of 1995 (UMRA)

This action does not contain any unfunded mandate as described in UMRA 2 U.S.C. 1531–1538 and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local or tribal governments or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. This action finds that seven states have failed to complete the requirement in the CAA to submit SIPs under section 110(a)(2)(D)(i)(I) of the CAA for the 2015 ozone NAAQS. No tribe is subject to the requirement to submit a transport SIP under section 110(a)(2)(D)(i)(I) of the CAA for the 2015 ozone NAAQS. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of ''covered regulatory action'' in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it is a finding that certain states have failed to submit a complete SIP that satisfies interstate transport requirements under section 110(a)(2)(D)(i)(I) of the CAA for the 2015 ozone NAAQS and does not directly or disproportionately affect children.

I. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act

This rulemaking does not involve technical standards.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes the human health or environmental risk addressed by this action will not have potential disproportionately high and adverse human health or environmental effects on minority, low-income, or indigenous populations. In finding that certain states have failed to submit a complete SIP that satisfies the interstate transport requirements under section 110(a)(2)(D)(i)(I) of the CAA for the 2015 ozone NAAQS, this action does not adversely affect the level of protection provided to human health or the environment.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

M. Judicial Review

Section 307(b)(l) of the CAA indicates which federal Courts of Appeal have venue for petitions of review of final actions by the EPA under the CAA. This section provides, in part, that petitions for review must be filed in the Court of Appeals for the District of Columbia Circuit if: (i) The agency action consists of ''nationally applicable regulations promulgated, or final action taken, by the Administrator,'' or (ii) such action is locally or regionally applicable, but ''such action is based on a determination of nationwide scope or effect and if in taking such action the Administrator finds and publishes that such action is based on such a determination.''

This final action is nationally applicable. To the extent a court finds this final action to be locally or regionally applicable, the EPA finds that this action is based on a determination of ''nationwide scope or effect'' within the meaning of CAA section 307(b)(1). This final action consists of findings of failure to submit required interstate transport SIPs for the 2015 ozone NAAQS from seven states located in four of the ten EPA Regional offices and five different federal judicial circuits. This final action is also based on a common core of factual findings concerning the receipt and completeness of the relevant SIP submittals. For these reasons, this final action is nationally applicable or, alternatively, to the extent a court finds this action to be locally or regionally applicable, the Administrator has determined that this final action is based on a determination of nationwide scope or effect for purposes of CAA section 307(b)(1).

Under section 307(b)(1) of the CAA, petitions for judicial review of this action must be filed in the United States Court of Appeals for the District of Columbia Circuit within 60 days from the date this final action is published in the **Federal Register**. Filing a petition for reconsideration by the Administrator of this final action does not affect the finality of the action for the purposes of judicial review nor does it extend the time within which a petition for judicial review must be filed and shall not postpone the effectiveness of such rule or action. Thus, any petitions for review of this action must be filed in the Court of Appeals for the District of Columbia Circuit within 60 days from the date this final action is published in the **Federal Register**.

NMED Exhibit 7j

Dated: November 22, 2019.

Anne L. Idsal,

Acting Assistant Administrator.

[FR Doc. 2019–26136 Filed 12–4–19; 8:45 am]

BILLING CODE 6560–50–P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 180

[EPA–HQ–OPP–2018–0623; FRL–10000–33]

Propamocarb; Pesticide Tolerances

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This regulation establishes tolerances for residues of propamocarb (also referred to as propamocarb hydrochloride (HCl) in this document) in or on guava, starfruit, the leafy greens subgroup 4–16A, the tuberous and corm vegetable subgroup 1C, and the fruiting vegetable group 8–10. Interregional Research Project Number 4 (IR–4) requested these tolerances under the Federal Food, Drug, and Cosmetic Act (FFDCA).

DATES: This regulation is effective December 5, 2019. Objections and requests for hearings must be received on or before February 3, 2020, and must be filed in accordance with the instructions provided in 40 CFR part 178 (see also Unit I.C. of the **SUPPLEMENTARY INFORMATION**).

ADDRESSES: The docket for this action, identified by docket identification (ID) number EPA–HQ–OPP–2018–0623, is available at *http://www.regulations.gov* or at the Office of Pesticide Programs Regulatory Public Docket (OPP Docket) in the Environmental Protection Agency Docket Center (EPA/DC), West William Jefferson Clinton Bldg., Rm. 3334, 1301 Constitution Ave. NW, Washington, DC 20460–0001. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the OPP Docket is (703) 305–5805. Please review the visitor instructions and additional information about the docket available at *http://www.epa.gov/dockets.*

FOR FURTHER INFORMATION CONTACT: Michael Goodis, Registration Division (7505P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave. NW, Washington, DC 20460–0001; main telephone number: (703) 305–7090; email address: *RDFRNotices@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this action apply to me?

You may be potentially affected by this action if you are an agricultural producer, food manufacturer, or pesticide manufacturer. The following list of North American Industrial Classification System (NAICS) codes is not intended to be exhaustive, but rather provides a guide to help readers determine whether this document applies to them. Potentially affected entities may include:

- Crop production (NAICS code 111).
- Animal production (NAICS code 112).
- Food manufacturing (NAICS code 311).
- Pesticide manufacturing (NAICS code 32532).

B. How can I get electronic access to other related information?

You may access a frequently updated electronic version of EPA's tolerance regulations at 40 CFR part 180 through the Government Publishing Office's e-CFR site at *http://www.ecfr.gov/cgi-bin/text-idx?&c=ecfr&tpl=/ecfrbrowse/Title40/40tab_02.tpl.*

C. How can I file an objection or hearing request?

Under FFDCA section 408(g), 21 U.S.C. 346a, any person may file an objection to any aspect of this regulation and may also request a hearing on those objections. You must file your objection or request a hearing on this regulation in accordance with the instructions provided in 40 CFR part 178. To ensure proper receipt by EPA, you must identify docket ID number EPA–HQ–OPP–2018–0623 in the subject line on the first page of your submission. All objections and requests for a hearing must be in writing, and must be received by the Hearing Clerk on or before February 3, 2020. Addresses for mail and hand delivery of objections and hearing requests are provided in 40 CFR 178.25(b).

In addition to filing an objection or hearing request with the Hearing Clerk as described in 40 CFR part 178, please submit a copy of the filing (excluding any Confidential Business Information (CBI)) for inclusion in the public docket. Information not marked confidential pursuant to 40 CFR part 2 may be disclosed publicly by EPA without prior notice. Submit the non-CBI copy of your objection or hearing request, identified by docket ID number EPA–HQ–OPP–2018–0623, by one of the following methods:

- *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the online instructions for submitting comments. Do not submit electronically any information you consider to be CBI or other information whose disclosure is restricted by statute.
- *Mail:* OPP Docket, Environmental Protection Agency Docket Center (EPA/DC), (28221T), 1200 Pennsylvania Ave. NW, Washington, DC 20460–0001.
- *Hand Delivery:* To make special arrangements for hand delivery or delivery of boxed information, please follow the instructions at *http://www.epa.gov/dockets/contacts.html.* Additional instructions on commenting or visiting the docket, along with more information about dockets generally, is available at *http://www.epa.gov/dockets.*

II. Summary of Petitioned-For Tolerance

In the **Federal Register** of December 21, 2018 (83 FR 65660) (FRL–9985–67), EPA issued a document pursuant to FFDCA section 408(d)(3), 21 U.S.C. 346a(d)(3), announcing the filing of a pesticide petition (PP 8E8692) by IR–4, IR–4 Project Headquarters, Rutgers, The State University of New Jersey, 500 College Road East, Suite 201 W, Princeton, NJ 08540. The petition requested that 40 CFR part 180 be amended by establishing tolerances for residues of the propamocarb (propyl N-[3-(dimethylamino)propyl]carbamate in or on the following raw agricultural commodities: Guava at 0.05 parts per million (ppm); starfruit at 0.05 ppm; leafy greens subgroup 4–16A at 150 ppm; vegetable, tuberous and corm, subgroup 1C at 0.30 ppm; and vegetable, fruiting, group 8–10 at 4.0 ppm. The petition also requested to amend 40 CFR 180.499 by removing the established tolerances for the residues of propamocarb in or on lettuce, head at 50 ppm; lettuce, leaf at 90 ppm; potato at 0.30 ppm; and vegetable, fruiting, group 8 at 2.0 ppm. That document referenced a summary of the petition prepared by Bayer CropScience, the registrant, which is available in the docket, *http://www.regulations.gov.* There were no comments received in response to the notice of filing.

EPA is establishing tolerances that vary slightly from what was requested to be consistent with Organization for Economic Cooperation and Development (OECD) Rounding Class Practice.

III. Aggregate Risk Assessment and Determination of Safety

Section 408(b)(2)(A)(i) of FFDCA allows EPA to establish a tolerance (the legal limit for a pesticide chemical residue in or on a food) only if EPA
